Information Request Package 10 from the Review Panel for the Roberts Bank Terminal 2 Project Environmental Assessment: Responses

List of Responses

IR10-01 Current Use of Lands and Resources for Traditional Purposes - Issues, Views and Concerns of Indigenous Groups

IR10-02 Current Use of Lands and Resources for Traditional Purposes – Indigenous Traditional Knowledge

IR10-03 Current Use of Lands and Resources for Traditional Purposes - Effects vs Rights

IR10-04 Current Use of Lands and Resources for Traditional Purposes – Effects Assessment / Wildfowl Harvesting Opportunity

IR10-05 Current Use of Lands and Resources for Traditional Purposes – Clarification: Vegetation

IR10-06 Current Use of Lands and Resources for Traditional Purposes – Effects Assessment / Access, Availability and Quality of Preferred Current Use Resources

IR10-07 Current Use of Lands and Resources for Traditional Purposes – Economic Conditions Assessment

IR10-08 Current Use of Lands and Resources for Traditional Purposes – Effects Assessment: Quality of the Current Use Experience

IR10-09 Current Use of Lands and Resources for Traditional Purposes – Mitigation Measures Effectiveness

IR10-10 Current Use of Lands and Resources for Traditional Purposes – Mitigation Measures: Offsets

IR10-11 Current Use of Lands and Resources for Traditional Purposes – Follow-up Program

IR10-12 Current Use of Lands and Resources for Traditional Purposes – Environmental Management Plans for Indigenous Peoples

IR10-13 Current Use of Lands and Resources for Traditional Purposes – Effects Assessment: Access, Availability and Quality of Preferred Current Use Resources

IR10-14 Current Use of Lands and Resources for Traditional Purposes – Socio-economic Conditions

IR10-15 Current Use of Lands and Resources for Traditional Purposes – Effects Assessment: Quality of the Current Use Experience

IR10-16 Current Use of Lands and Resources for Traditional Purposes – Effects Assessment: Access to Current Use Locations and Vessel Pass-bys

IR10-17 Current Use of Lands and Resources for Traditional Purposes – Mitigation Measures: Current Use Access

IR10-18 Current Use of Lands and Resources for Traditional Purposes – Mitigation Measures: Clarification

IR10-19 Current Use of Lands and Resources for Traditional Purposes – Mitigation Measures

IR10-20 Current Use of Lands and Resources for Traditional Purposes – Follow-up Program

IR10-21 Physical and Cultural Heritage - Baseline Information, Effects Assessment, Physical and Cultural Heritage Sites

IR10-22 Cultural Heritage - Effects Assessment

IR10-23 Archaeological and Heritage Resources – Baseline Information, Effects Assessment, Archaeological Sites

IR10-24 Archaeological and Heritage Resources – Chance Find Procedure

IR10-25 Archaeological and Heritage Resources – Mitigation Measures: Indigenous Input

IR10-26 Current Use of Lands and Resources for Traditional Purposes - Effects Assessment, Future Availability of Preferred Marine Resources

IR10-27 Effects assessment Socio- economic Conditions – Commercial Ventures for Indigenous Peoples

IR10-28 Effects Assessment Socio-economic Conditions – Labour Market for Indigenous Peoples

Appendix IR10-A Group-Specific Baseline Information Process Summaries, Index and Assessment Tables

IR10-01 Current Use of Lands and Resources for Traditional Purposes – Issues, Views and Concerns of Indigenous Groups

Information Source(s)

EIS Volume 1: Appendix 7.2-B

Marine Shipping Addendum: Appendix 5-B

Context

In Appendix 7.2-B of the EIS and Appendix 5-B of the Marine Shipping Addendum, the Proponent presented its responses to the issues, views and concerns raised by Indigenous groups by topic, rather than by Indigenous group.

In their submissions to the Canadian Environmental Assessment Agency and the Review Panel, many Indigenous groups expressed concerns about the absence of comprehensive group-specific information.

Updated group-specific tables presenting the issues, views and concerns of each Indigenous group are required by the Panel to allow a better understanding of each group's concerns.

Information Request

Provide updated tables presenting the issues, views and concerns of each Indigenous group listed in Appendix 7.2-B of the EIS and Appendix 5-B of the Marine Shipping Addendum related to proposed Project and marine shipping associated with the Project. Each table should be group-specific and include all the existing information presented in Appendix 7.2-B of the EIS and Appendix 5-B of the Marine Shipping Addendum, as well as any new information that has been received by the Proponent or placed on the Canadian Environmental Assessment Registry Internet Site prior to December 19, 2017.

Include the Indigenous groups' perspectives on the Proponent's analysis and conclusions, as well as any outstanding issues.

VFPA Response

The VFPA has responded to this Review Panel request by providing two overview summaries, in addition to the updated tables as requested.

Appendix IR10-01-A presents the VFPA's Indigenous engagement and consultation objectives and approach with respect to RBT2 and marine shipping associated with the Project.

Appendix IR10-01-B presents a high level summary of the recurring topics, including issues, views, and concerns shared by Indigenous groups during engagement and consultation

activities and identified by the VFPA during the course of its updating of the tables provided in **Appendix IR10-01-C**.

Appendix IR10-01-C presents the VFPA's understanding of the issues, views, and concerns, raised by Indigenous groups—disaggregated by Indigenous group—as documented from early 2012 (prior to the initiation of the environmental assessment process) through to December 31, 2017. The tables include issues, views, and concerns reported in EIS Appendix 7.2-B, Appendix 5-B of the Marine Shipping Addendum (MSA), as well as Appendix 2-B of the Additional Information to the EIS – *W*SÁNEĆ Nation (AIEIS) and Appendix 2-B of the Additional Information to the MSA – Musqueam First Nation and Tsleil-Waututh Nation (AIMSA), as well as items from other sources such as engagement activities or Canadian Environmental Assessment Agency registry postings to December 31, 2017. As such, the VFPA considers these tables a comprehensive reflection of all Project-related Indigenous issues, views, and concerns to that date.

Indigenous groups' perspectives on the VFPA's analysis and conclusions, as well as any outstanding issues, are captured as part of issues, views, and concerns presented in the tables for all groups identified for consultation by the Canadian Environmental Assessment Agency, as listed below, with the exception of Stó:lō Tribal Council and Stó:lō Nation as they deferred the review of the Project to other Indigenous groups. In the tables, the VFPA has indicated the date and source of the issue, view, and concern, and where appropriate the VFPA's response. As applicable, the VFPA has also indicated where or how the issue, view, and concern is addressed, or where additional information is available.

APPENDIX IR10-01-A

INDIGENOUS ENGAGEMENT AND CONSULTATION OVERVIEW

Appendix IR10-01-A Indigenous Engagement and Consultation Overview

The purpose of this overview is to summarise the activities undertaken by the VFPA in engaging and consulting with Indigenous groups on the Project and marine shipping associated with the Project.

The overview refers to the engagement and consultation activities previously described through the RBT2 Environmental Assessment (EA) process, as reported in the EIS, Marine Shipping Addendum (MSA), Additional Information to the Marine Shipping Addendum – Musqueam First Nation and Tsleil-Waututh Nation (AIMSA), and Additional Information to the EIS – *W̲SÁNEĆ* Nation (AIEIS). It also summarises the VFPA's approach to ongoing consultation.

Aboriginal Engagement and Consultation Overview

The VFPA began its Indigenous group engagement and consultation activities early in the Project planning process. These efforts have continued through the different phases of the RBT2 EA and are ongoing.

Table IR10-01-A1 outlines consultation activities that have taken place, over five phases of project development and environmental assessment, since 2011.

Table IR10-01-A1 Summary of Consultation Activities by Phase since 2011

	Consultation Phase	Overview	Duration/Status
1	Pre-EIS	From Project conception and planning in early 2011, to submission of a Project Description to the Canadian Environmental Assessment Agency (CEA Agency) and B.C. Environmental Assessment Office (EAO) in September 2013, this phase included pre-consultation, Project definition consultation, and pre-design consultation phases of Project development; development and implementation of a field studies program, including collection of baseline information and sharing of draft EA-related documents.	January 2011 to August 2013 COMPLETE
2	Project Description	This phase included discussion of the Project Description, potential Project-related effects and possible mitigation measures. The CEA Agency consulted on the *EIS Guidelines* during this phase.	September 2013 to December 2013 COMPLETE
3	EIS Development	The CEA Agency finalised the *EIS Guidelines* and formally identified Indigenous groups requiring consultation during this phase. Consultation regarding preliminary environmental mitigation concepts was undertaken, and EIS development consultation focused on sharing information and receiving feedback on effects assessment methods and findings, as well as mitigation measures. This phase included technical working groups, direct communication and issue response, workshops, and review of EIS sections prior to submission.	January 2014 to December 2014 COMPLETE

	Consultation Phase	Overview	Duration/Status
4	CEA Agency Completeness Review	This phase included engagement directly before EIS submission (January to March 2015); included consultation on the EIS, development and submission of the MSA and Completeness Information Requests (April 2015 to May 2016). Discussion of potential effects and mitigation proposed continued and discussion of benefit agreements commenced.	January 2015 to May 2016 COMPLETE
5	Review Panel	Continued discussion of proposed mitigation measures and offsetting, follow-up program, and legacy benefits.	June 2016 to present UNDERWAY

Consultation and engagement activities undertaken during the Pre-EIS, Project Description, and EIS Development phases are described in Section 7.2 of the EIS (March 27, 2015).

Consultation and engagement activities undertaken during the CEA Agency Completeness Review phase and related to marine shipping associated with the Project are described in Section 5.0 of the MSA (October 26, 2015).

Consultation and engagement activities undertaken with Musqueam First Nation and Tsleil-Waututh Nation during the CEA Agency Completeness Review phase and related to marine shipping associated with the Project are described in Section 2.0 of the AIMSA (October 4, 2016).

Consultation and engagement activities undertaken with Tsawout First Nation, Pauquachin First Nation, Tsartlip First Nation, Tseycum First Nation, and Malahat Nation (collectively, *W*SÁNEĆ Nation) regarding the contents and conclusions of the EIS are described in Section 2.0 of the AIEIS (February 10, 2017).

Engagement and Consultation Objectives

Consultation throughout the EA process for RBT2 has been guided by the following principles:

- Build and maintain positive, productive, and lasting relationships between the port authority and Indigenous groups and their leadership;
- Ensure that all applicable legal, regulatory, and policy requirements are effectively addressed in a timely manner, consistent with the regulatory and Project schedule;
- Involve Indigenous groups in the development of Project follow-up initiatives to ensure concerns are addressed;
- Understand and respect the different preferences, protocols, and needs of each of the Indigenous groups with respect to consultation, participation, and knowledge sharing; and
- Work to achieve lasting benefits for their communities through a respectful, valuable, and meaningful process.

Additional detail regarding the engagement and consultation objectives specific to previous phases of Project consultation can be found in the EIS, MSA, AIMSA, and AIEIS, as described above.

Identification of Indigenous groups

Section 9.2 of the *EIS Guidelines* issued by the CEA Agency in January 2014 identified and directed the VFPA to engage with the following Indigenous groups, whose potential or established Aboriginal and treaty rights and related interests may be affected by the Project:

1. Tsawwassen First Nation;
2. Musqueam First Nation;
3. Semiahmoo First Nation;
4. Tsleil-Waututh Nation;
5. Stz'uminus First Nation;
6. Cowichan Tribes;
7. Halalt First Nation;
8. Lake Cowichan First Nation;
9. Lyackson First Nation;
10. Penelakut Tribe; and
11. Métis Nation British Columbia.

Section 9.2 of the *EIS Guidelines* also identified and directed the VFPA to make key EA summary documents accessible to the following Indigenous groups less likely to be affected by the Project and its related effects:

- Stó:lō Tribal Council (Seabird Island First Nation, Scowlitz First Nation, Soowahlie Band, Kwaw'Kwaw'Apilt First Nation, Kwantlen First Nation, Shxw'ow'hamel First Nation, Chawathil First Nation, Cheam Indian Band); and
- Stó:lō Nation (Aitchelitz First Nation, Leq'a:mel First Nation, Matsqui First Nation, Popkum First Nation, Skawahlook First Nation, Skowkale First Nation, Shxwha:y Village, Squiala First Nation, Sumas First Nation, Tzeachten First Nation, Yakweakwioose Band).

The VFPA provided documents to Stó:lō Tribal Council and Stó:lō Nation, but Stó:lō Tribal Council and Stó:lō Nation deferred the review of this Project to other Indigenous groups.

In addition to those groups included in the *EIS Guidelines,* the VFPA also engaged with, and provided Project-related information to Hwlitsum. The VFPA submitted the EIS to the CEA Agency on March 27, 2015.

In April 2015, the CEA Agency issued the *Updated EIS Guidelines* wherein section 17.5 identified and directed the VFPA to engage with the following Indigenous groups on the effects of marine shipping associated with the Project:

- Tsawwassen First Nation;
- Semiahmoo First Nation;

- Stz'uminus First Nation;
- Cowichan Tribes;
- Halalt First Nation;
- Lake Cowichan First Nation;
- Lyackson First Nation;
- Penelakut Tribe; and
- Métis Nation British Columbia.

The *Updated EIS Guidelines* further identified and directed the VFPA to engage with the following additional Indigenous groups that may be affected by marine shipping associated with the Project:

- Tsawout First Nation;
- Pauquachin First Nation;
- Tsartlip First Nation;
- Tseycum First Nation;
- Malahat Nation;
- Beecher Bay Indian Band;
- Esquimalt Nation;
- Songhees First Nation;
- T'Sou-ke Nation;
- Pacheedaht First Nation;
- Ditidaht First Nation; and
- Maa-nulth First Nations (Huu-ay-aht First Nations, Ka:'yu:'k't'h'/Ch e:k'tles7et'h First Nations, Toquaht Nation, Uchucklesaht Tribe, and Ucluelet First Nation).

The VFPA also engaged with, and provided Project-related information to, Hwlitsum regarding marine shipping associated with the Project. The VFPA submitted the MSA to the CEA Agency on October 26, 2015.

In January 2016, the CEA Agency further directed the VFPA to engage with Musqueam First Nation and Tsleil-Waututh Nation on the effects of marine shipping associated with the Project. The VFPA submitted the AIMSA to the CEA Agency on October 4, 2016.

Also in January 2016, the CEA Agency identified Tsawout First Nation, Pauquachin First Nation, Tsartlip First Nation, Tseycum First Nation, and Malahat Nation (collectively, *W̲SÁNEĆ* Nation) as Indigenous groups whose potential or established Aboriginal and treaty rights and related interests may be affected by the Project, and directed the VFPA to obtain their views on the effects of changes to the environment on Indigenous peoples due to the Project and potential impacts of the Project on asserted or established Aboriginal or treaty rights. The VFPA submitted the AIEIS on February 10, 2017.

Participation Support

The VFPA has provided participation funding to facilitate continued engagement and consultation on the Project. The VFPA has provided participation funding specific to review of

draft EIS sections, provision of knowledge studies, and participation in the CEA Agency review of the Project and marine shipping associated with the Project.

Indigenous Engagement and Consultation Methods

The VFPA has implemented a broad range of engagement and consultation methods to support the process of compiling detailed information related to the scope and nature of Indigenous groups' interests in RBT2 and marine shipping associated with the Project. Throughout the phases of the RBT2 EA, these methods have included the following:

- Distribution of materials for information, review, and input;
- Meetings with leadership and representatives;
- Distribution and review of EA-related process documents;
- Organisation and hosting of workshops to provide information and receive feedback regarding the Project, EIS findings, including existing and expected conditions, potential effects, and proposed mitigation measures;
- Recording of Indigenous groups comments; and
- Follow up on issues identification and resolution.

The VFPA has carried out the activities outlined above through various means of direct communication, including meetings, interviews, workshops, phone calls and voicemails, conference calls, presentations, site visits and boat tours, letters, reports, and emails. Communications were often supplemented by the use of visual aids, including PowerPoint presentations and maps.

APPENDIX IR10-01-B

INDIGENOUS ISSUES, VIEWS, AND CONCERNS: RECURRING TOPICS

Appendix IR10-01-B Indigenous Issues, Views, and Concerns: Recurring Topics

Appendix IR10-01-C compiles the VFPA's understanding of the issues, views, and concerns raised by Indigenous groups—disaggregated by Indigenous group—from early 2012 (prior to the initiation of the environmental assessment process) through to December 31, 2017. These Indigenous group-specific tables respond to IR10-01 as issued by the Panel.

The comprehensive tables in Appendix 10-01-C demonstrate the extent of consultation and documentation of Indigenous group inputs. The VFPA acknowledges that several issues, views, and concerns in Appendix IR10-01-C recur across many of the disaggregated tables. The VFPA has identified the following ten prominent topics that were raised across many of the groups and has summarised these at a high level below. The VFPA encourages the Panel, Indigenous groups, and regulators to review the full tables for a more complete understanding of the issues, views, and concerns raised by each Indigenous group, and a summary from the VFPA of how and where the topics have been addressed.

Summary of recurring topics:

- **Assessment Methods:** Indigenous groups expressed interest in the scope and methods of the environmental assessment and extent to which the views of Indigenous groups and Indigenous traditional knowledge (ITK, elsewhere referred to as 'Aboriginal Traditional Knowledge (ATK)' or 'Traditional Ecological Knowledge (TEK)' are included in the EIS.
- **Cumulative Effects:** Indigenous groups questioned the methods for considering cumulative effects within the EIS process, and emphasised that the EIS does not adequately capture pre-causeway or pre-industrial baseline and instead assesses incremental effects, which many feared would lead to a continued decline in the health of the environment (or 'death by a thousand cuts'). Many Indigenous groups also expressed an interest in the 'carrying capacity' of the environment, or alternatively, the 'tipping point' after which a resource can no longer sustain itself.
- **Crabs and Crab Harvesting:** Indigenous groups expressed concerns regarding potential Project effects (including effects related to the intermediate transfer pit or ITP) to crab habitat and crab productivity in the Roberts Bank area, in particular during sensitive life stages, and a marked interest in discussions regarding mitigation measures. Many Indigenous groups expressed a strong interest in potential impacts from the Project and/or the proposed navigational closure area to crab productivity and access to areas for commercial and food, social, and ceremonial (FSC) harvesting activities.
- **Fish and Fish Habitat:** Indigenous groups expressed concerns regarding the use of representative species in the environmental assessment for species of unique cultural, social, and economic importance to Indigenous communities—in particular eulachon, sockeye salmon, and sturgeon—and concern regarding potential impacts from the Project to these species, including migration pathways and holding areas near Roberts Bank and the Fraser River. These concerns were noted in the context of existing threats on the populations of these species.
- **Marine Mammals:** Indigenous groups communicated the cultural and spiritual importance of marine mammals, in particular the southern resident killer whale, and

expressed concern regarding potential Project impacts, such as potential ship strikes or impacts to southern resident killer whale food sources, in the context of existing cumulative threats to the viability of the species.

- **Human Health:** Indigenous groups discussed general concern about health of Indigenous communities, including that individuals are less healthy due to a lack of traditional foods, and concern that any impact to harvesting may lead to further declines in health. Indigenous groups noted concerns related to air quality, noise, and light pollution, and that a perception that marine resources are contaminated, specifically Dungeness crab and bivalves, may lead to further avoidance of traditional foods.
- **Effects to Cultural Heritage and Rights:** Indigenous groups highlighted concerns with potential effects of the Project to traditional practices, including effects to the inter-generational transmission of knowledge, to the availability of resources for harvest, to their ability to access preferred harvesting areas, and to the quality of the current use experience. Indigenous groups highlighted the responsibility of the proponent and the duty of the Crown to reduce/avoid or compensate for any impacts to asserted and/or established Aboriginal or treaty Rights.
- **Vessel Transits and Wake:** Indigenous groups highlighted existing issues related to vessel transits that would intensify with any increase in marine shipping, including wake leading to erosion of shoreline habitat and damage to archaeological sites and/or sites of significance; and threats to safety of those travelling or harvesting in small vessels near the shipping lanes when container ships approach. Indigenous groups raised questions on roles and responsibilities of the parties involved in regulation and enforcement of marine shipping activities.
- **Potential Container Ship Collision or Spill:** Indigenous groups raised concern regarding the potential for a catastrophic accident or malfunction involving a container ship in transit, leading to a spill of fuel or loss of containers overboard with wide-reaching environmental and human health effects. Indigenous groups questioned who would be responsible for responding to an incident and the ability of parties to respond effectively, and questioned the mechanisms in place to force guilty parties to compensate for any environmental or economic damage that might occur.
- **Accessing Project Benefits:** Indigenous groups expressed interest in potential opportunities related to the Project, including employment, training, and contracting opportunities, and stressed the importance of early planning to ensure opportunities for their communities are maximised.

TSAWWASSEN FIRST NATION: ISSUES, VIEWS, AND CONCERNS RELATED TO THE PROPOSED PROJECT AND MARINE SHIPPING ASSOCIATED WITH THE PROJECT

Tsawwassen First Nation

Table 1: Air Quality – Intermediate Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-1.1	Concerned about potential adverse effects on air quality. Concerned that air quality had deteriorated. Concerned with the coating of homes with black dust, especially in the summer and request for information regarding the filtering system currently in use at Roberts Bank. Stated that air quality is a key concern for TFN members. Concerned with increased operations associated with RBT2 and problems with air quality from the project. Concerned with current state of air quality at Roberts Bank and potential for additional effects from Project. Concerned that air quality monitoring station is required despite results from current monitoring data by Metro Vancouver. Expressed an interest in a permanent air quality station on TFN lands. Concerned that the location of current air quality monitoring activities at Station T39 in Pebble Hill Park is too far away to adequately assess air quality conditions on TFN lands and in closer proximity to port infrastructure.	12-Oct-2012, Meeting – DTRRIP Air Quality 25-Jan-2013, Meeting 28-Jan-2013, Meeting with Tsawwassen First Nation Advisory Council 14-Jun-2013, Meeting - Air Quality Working Group Meeting 16-Oct-2013, Letter to the Canadian Environmental Assessment Agency (CEA Agency) 24-Oct-2013 Meeting – RBT2 Update 18-Nov-2013, Community Health Meeting 27-Nov-2013, Community Open House 14-Apr-2014, Community Meeting - RBT2-HIA Update 02-May-2014, Meeting – Air Quality 28-Jul-2014, Meeting – Air Quality 11-Sep-2014, Letter 15-Sep 2014, Phone Call	**12-Oct-2012, Meeting:** Acknowledged Tsawwassen First Nation's concerns related to increased effects on air quality resulting from development. Committed to discuss internally at the Vancouver Fraser Port Authority (VFPA) and indicate whether or not there is a commitment to collaborate on air quality initiative. **25-Jan-2013, Meeting:** Stated that Air Quality Scoping Session is being scheduled for mid-February and that Environment Canada, Metro Vancouver and the Corporation of Delta have been invited. **28-Jan-2013, Meeting:** Stated that the VFPA has been requested to sample around the community. They have also been asked to possibly consider emission testing stations. The VFPA is also installing power modules on the docks to enable ships to shut off (shore power). **13-Feb 2013, Workshop:** Hosted an Air Quality Working Group Scoping meeting. **22-Apr-2013, Email from the VFPA:** Sent out Draft Air Quality Scoping Study Assessment Protocol for review or comment pursuant to Feb 13 meeting. **14-Jun-2013, Meeting:** Committed to follow-up on air quality monitoring stations. **26-Sept-2013, Workshop:** Hosted Air Quality Scoping Study Workshop Follow-up. **24-Oct-2013, Meeting:** Stated that the commitment to working with Tsawwassen First Nation on air quality monitoring was previously committed to in DTRRIP. Offered to follow-up with Tsawwassen First Nation to coordinate air quality or human health risk assessment session as it relates to RBT2. **18-Nov-2013, Community Meeting:** Explained that the VFPA's intention at this community meeting is to collect information about the concerns so that they can be appropriately scoped into studies.	**Addressed in EIS Section 9.2:** The Tsawwassen First Nation lands, and the Tsawwassen area in general, have some of the best air quality in the Lower Fraser Valley. Moreover, based on a comparison of measured annual average respirable particulate matter ($PM_{2.5}$) concentrations at Pebble Hill Park and the database of observed $PM_{2.5}$ levels in the world compiled by the World Health Organization, the Tsawwassen First Nation lands and Tsawwassen have some of the best air quality for urban areas in the world. The anticipated reduction in air emissions from the three existing marine terminals at Roberts Bank (i.e., Deltaport, Westshore and Tsawwassen ferry terminals) due to fleet turnover to newer, lower emitting vessels, cargo handling equipment, rail locomotives and on-road trucks and cars, will more than compensate for any increase in emissions from the new operations at the Roberts Bank Terminal 2 (RBT2 or Project). As such, air quality levels in the Tsawwassen area are expected to improve, with or without the Project. **Additional information provided by the VFPA:** An assessment was carried out to predict potential changes in air quality as a result of the Project, including a characterisation of existing conditions. This is provided in EIS Section 9.2. The results of the air quality assessment were used in the assessments of human health and current use of lands and resources for traditional purposes (Current Use). The assessment modelled Project-related fuel combustion and fugitive dust emission sources during the construction phase, and fuel combustion emission sources during the operation phases, and compared future conditions with the Project to modelled existing conditions and future expected conditions. Existing conditions considered emissions from marine vessels, trains, trucks, vehicles, and cargo handling equipment from the existing Westshore Terminals, Deltaport Terminal, and BC Ferries Terminal, while emissions from industrial, commercial and residential sources within Delta were represented through measured air quality levels in Tsawwassen. A general trend of decreasing concentrations of contaminants has been observed and is expected to continue in the Lower Fraser Valley for some criteria air contaminants, as well as for some trace organic contaminants. Predicted maximum concentrations were used to conservatively estimate existing conditions and potential changes from the Project. Estimated emissions and predicted ambient concentrations did not account for the inclusion of shore power as part of the Project, which is expected to decrease future emissions from ships at berth, ultimately improving future air quality compared to predicted concentrations. The predicted concentrations also did not account for the switch to the use of liquefied natural gas (LNG) fuel for ferry vessels at the Tsawwassen ferry terminal. The assessment concludes that: • Air quality in the region will improve in the future, with or without the Project, as a result of improvements in engine technologies as older equipment is replaced by newer equipment at the three existing marine terminals, and the use of cleaner fuels. • Cumulative changes, incorporating the Project and other certain and reasonably foreseeable projects and activities, are predicted to be small relative to expected improvements in future ambient air quality levels. • Project construction activities are predicted to cause a small increase in concentrations of some contaminants, but will be mitigated through the use of emission reduction measures to limit fugitive dust emissions and a monitoring program to guide construction activity in the event that ambient air concentration exceed defined criteria threshold levels.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 9.0 Physical Setting 9.2 Air Quality 9.2.5 Methods 9.2.6 Existing Conditions 9.2.7 Expected Conditions 9.2.8 Future Conditions with the Project 9.2.9 Future Conditions with the Project and Other Projects and Activities Table 9.2-4 Air Quality Criteria for Criteria Air Contaminants Table 9.2-5 Air Quality Criteria for Toxic Organic Contaminants Appendix 9.2-A Air Quality Study Main Report Appendix A - Emissions Inventory Appendix B – Existing Air Quality Appendix C - Air Dispersion Modelling Appendix F - Ships Underway Appendix H – Westshore Coal Dust Assessment **Information Requests** Response to Sufficiency Request #4 (IR6-04 of CEAR Document #1188) Response to Sufficiency Request #9 (IR6-09 of CEAR Document #1113)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
		10-Oct-2014, Letter 26-Nov-2014, Health & Aboriginal Rights Workshop – Tsawwassen First Nation 12-Jul-2016, Meeting	Noted that information would be taken back to the VFPA staff and Project team for consideration. **27-Nov-2013, Community Open House:** Responded with an explanation on contaminants and how they move in air masses. Discussed the 2006 studies and how the data coming from stations on the bluff could be similar to mobile stations on the shore. Indicated that more stations may be put in, but the VFPA will need to discuss that further. **02-Dec-2013, Email from the VFPA:** Sent follow-up to Sept 26 meeting Baseline Air Quality. *"As requested by agency stakeholders and confirmed within the Draft Air Quality Scoping Study Response to comments document, [the VFPA] will include the 98th percentile observations from the T39 Monitoring Station in Tsawwassen for the various compounds in the assessment (as well as average or median concentrations) as an alternate measure of baseline air quality. Incremental impacts without baseline concentrations will be discussed as part of the assessment to give full context to the impacts of the project. Presenting an average concentration will show typical conditions, and the incremental impacts can be used to discuss relative differences associated directly with the Project. Suggestions to use the monitoring data from other stations in the region, besides the Station T39 to help define baseline air quality in Tsawwassen, was an approach that was previously attempted for the [Deltaport Third Berth (DP3)] Project and found to overestimate the baseline air quality in Tsawwassen for some pollutants including CO (by more than a factor of 5) and NO_2 (by a factor of 2). In the absence of monitoring data in Tsawwassen for the list of selected trace organic compounds that will be included in the assessment, the VFPA will rely on data collected in other parts of the Lower Fraser Valley or elsewhere to define nominal baseline air quality levels for those contaminants."* **15-Jan-2014, Letter from the VFPA:** The VFPA, in partnership with Metro Vancouver, has installed an air quality monitoring station in Tsawwassen at 411 Milsom Wynd. The placement was chosen by the DP3 Air Quality Working Group as an ideal location to monitor emissions from Roberts Bank terminals. The VFPA is currently working through the	• Criteria air contaminant (i.e., carbon monoxide, nitrogen oxides, sulphur dioxide, particulate matter, and ground-level ozone) and trace organic contaminants (i.e., formaldehyde and other contaminants related to fuel combustion) levels are predicted to be below ambient air quality criteria on land, with limited exceptions. The exceptions for predicted nitrogen dioxide levels near the causeway are considered to be an artificially caused by the conservative methods used in the air quality assessment, and are not expected to actually exceed established ambient air quality criteria. • The Project is expected to have a negligible effect on future ozone levels. • Although Project activities would emit black carbon, black carbon is expected to decrease in the future with the Project due to equipment fleet turnover at existing Roberts Bank terminals to newer engines that meet more stringent emission standards for particulate matter. The Project is not expected to result in any significant adverse effect on human health, including from changes in air quality because air quality is expected to improve. The benefits of existing emission reduction initiatives are realised in the existing emissions monitored at local air quality stations in Metro Vancouver. Future benefits to air quality, such as improvements in engine technology and fuel quality, are described based on their anticipated level of benefit to future air quality emissions in EIS Section 9.2.7. Through its ongoing Air Action Program*, the VFPA is constantly looking at addressing air quality and climate change, by focusing on the use of technologies and the promotion of operational efficiencies to reduce air emissions from port operations, such as those mitigation measures suggested during consultation. Key components of the Air Action Program include the EcoAction Program, the Northwest Ports Clean Air Strategy, the Landside Air Emissions Inventory, and environmental requirements through the Truck Licensing Program. Information regarding the VFPA's Air Action Program can be found at http://www.portmetrovancouver.com/en/environment/initiatives/Air.aspx. *The Air Action program was renamed to Air, Energy and Climate Action. As part of DP3, the VFPA funded the establishment of the Tsawwassen Air Quality Monitoring Station. The location of the station, at Pebble Hill Reservoir located at 411 Milsom Wynd in Delta, was chosen by the Delta Air Quality Monitoring Technical Working Group (composed of representatives from Corporation of Delta, Environment Canada, Metro Vancouver, Tsawwassen First Nation, and the VFPA). The station is comprised of state-of-the-art monitoring equipment including ozone and particulate monitoring technologies. Since this station is part of Metro Vancouver's regional air quality monitoring network, results from the station can be viewed in real-time at www.bcairquality.ca/readings. **Further information provided by the VFPA:** Information on air quality monitoring data in Tsawwassen presented in the EIS covered the period 2010-2012. Discussions around air quality monitoring between Tsawwassen First Nation and the VFPA have occurred independently of the EA. On 15-Jan-2015 Tsawwassen First Nation agreed to plans for the undertaking of additional air quality monitoring, which was completed in 2014 and 2015. Mobile Air Monitoring Units (MAMUs) were temporarily installed at two sites on Tsawwassen First Nation lands: one near the Tsawwassen First Nation Wastewater Treatment Plant on Tsawwassen Drive and the other at 1120 Tsatsu Shores Drive. Three dustfall canisters were also operated for the duration of the monitoring, at the two sites on Tsawwassen First Nation lands as well as at existing Station T39 in Pebble Hill Park at 411 Milsom Wynd in Tsawwassen. The plans for this Air Quality Monitoring Study were agreed to by Tsawwassen First Nation on 15-Jan-2015 (the results of the study is presented in IR6-09 and IR6-04. The monitoring data indicate that there were marked declines in SO_2	

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			Tsawwassen First Nation Air Quality Working Group to address additional air quality concerns, which includes the consideration of alternatives to support local air quality monitoring. Discussions around air quality monitoring between Tsawwassen First Nation and the VFPA have occurred independently of the environmental assessment (EA). On 15-Jan-2015 Tsawwassen First Nation agreed to plans for the undertaking of additional air quality monitoring, which was completed in 2014 and 2015. Mobile Air Monitoring Units (MAMUs) were temporarily installed at two sites on Tsawwassen First Nation lands: one near the Tsawwassen First Nation Wastewater Treatment Plant on Tsawwassen Drive and the other at 1120 Tsatsu Shores Drive. Three dustfall canisters were also operated for the duration of the monitoring, at the two sites on Tsawwassen First Nation lands as well as at existing Station T39 in Pebble Hill Park at 411 Milsom Wynd in Tsawwassen. The plans for this Air Quality Monitoring Study were agreed to by Tsawwassen First Nation on 15-Jan-2015. **14-Apr-2014, Community Meeting:** Stated that the air quality monitoring site [Station T39] is located on top of [English] Bluffs because meteorological data determined it to be the optimal site for measuring air emissions. Noted that baseline monitoring is being done as part of the Air Quality study related to RBT2. The VFPA undertook to take back the request for additional monitoring of current air quality conditions in closer proximity to residents of Tsawwassen First Nation lands for consideration. **23-Apr-2014, Letter from the VFPA:** Proposed outline for a series of air-quality-related workshops coordinated by the VFPA to be held between May to July 2014. **02-May-2014, Meeting:** Discussed possibility of installing mobile air quality monitoring units on Tsawwassen First Nation lands. Referred to DP3 decision-making process and how the VFPA and Tsawwassen First Nation collectively agreed to locate a station at the bluff. Stressed the importance of having a process based on data, involving different parties and agreeing to next steps once data is obtained. Discussed option of placing three units on Tsawwassen First Nation lands for up to a year.	and $PM_{2.5}$, and little to no change in levels of NO_2 and ground-level ozone. The levels of carbon monoxide remain far below any levels of concern.	

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			Noted the need to coordinate mobile units and stated that there is currently no certainty about availability of units so need to discuss with Westshore and Metro Vancouver. Stated that a rational process based on data is needed, that the VFPA commits to getting temporary units and to a plan or process. Requested that Tsawwassen First Nation submit any questions on air quality to the VFPA's Environmental Programs Department. **28-Jul-2014, Meeting:** Presented draft air quality monitoring proposal and sought input from Tsawwassen First Nation. The results of the study are further supported by the on-going air quality monitoring station (Station T39) at Pebble Hill Park on English Bluffs which consistently shows that measured air quality is within AAQOs." **24-Sept-2014, Letter from the VFPA:** *"Station T39 is owned and operated by Metro Vancouver. The location of the station was determined through the DP3 Technical Working Group as the site where port-related emissions are most likely to be observed. In addition to Tsawwassen First Nation, beneficiaries include residents of Tsawwassen and Delta. As such, [the VFPA] cannot support moving the station without adequate technical justification and the consultation of other stakeholders who may be impacted by the decision. However, [the VFPA] is willing to support discussions on further air quality studies in partnership with Metro Vancouver based on the outcome of the current study."* **30-Sept-2014, Email from the VFPA:** Sent status update on T39 and AQ monitoring program. **26-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **15-Dec-2014, Letter from the VFPA:** Sent letter in response to Tsawwassen First Nation October 10 letter with comments on draft Air Quality Plan. *"Your first request is that [the VFPA] undertake air quality monitoring through the summer months. [The VFPA] will include air quality monitoring during summer months in the Air Quality Monitoring Plan as per your request. Your second request is that the Air Quality Monitoring*		

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			Plan be extended from a one-year program to a two-year program. As described in the proposed Plan, at the end of the first year of monitoring, [the VFPA] and TFN review the monitoring results and TFN's air quality concerns. Based on that analysis and in consultation with TFN, the scope of a second year of testing will be determined." **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, including Section 9.2 on the air quality assessment. **12-Jul-2016, Meeting:** Discussed the VFPA's air quality programs delivered through the VFPA's Environmental Programs department.		
TFN-1.2	Interested in the parameters and methods of the VFPA's air quality study. Asked whether the VFPA is going to undertake the study in a manner that will address TFN's concerns. Provided comments on the draft Air Quality Scoping Study: #1. Asked why the VFPA has added the proposed objective: Identify the potential need for additional air quality studies based on the above results. Expressed concern that the result of this study will be used to discount the need of any further studies in the future. #2. Asked why the air quality assessment won't test for all types of sulfur oxides. #3/4. Concerned that the assessment only includes on location in the fall and one location in the spring in one year. Suggested a two year sample period be considered.	18-Nov-2013, Community Meeting 13-Dec-2013, Email 10-Jul-2014, Meeting 11-Sep-2014, Letter	**18-Nov-2013, Meeting:** Noted that the air quality study is mostly predictive. It considers the current air quality then models emissions into the future. The model's predictions are compared with the data coming out of the monitoring stations. The methodology was revised based on feedback received during scoping sessions, involving Tsawwassen First Nation, and the Emission Inventory is available online. **15-Jan-2014, Letter from the VFPA:** The focus for air emissions studies associated with Project-related construction and operation activities will include: 1. Common air contaminants such as nitrogen dioxide (NO_2), carbon monoxide (CO), sulphur dioxide (SO_2), hydrocarbons (HC), total suspended particulate matter (PM), inhalable particulate matter (PM_{10}), and respirable particulate matter ($PM_{2.5}$); 2. Selected mobile source air toxins which have been determined to be of significance to human health such as acetaldehyde, acrolein, benzene, 1,3-butadiene, diesel particulate matter, formaldehyde and naphthalene; and 3. Compounds related to climate change issues including greenhouse gases such as carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), and black carbon. The air quality study will use existing air quality monitoring data and dispersion modelling methods to predict changes in future air quality. Results will be compared to established Ambient Air Quality Objectives and Standards defined by	**Addressed in EIS Section 9.2.2.1:** In 2012, the VFPA initiated studies to support the EA and future environmental management for the Project. Building on available information, the studies were designed to address known data gaps for the assessment of air quality at Roberts Bank. Two studies were completed: 1. Air Quality Scoping Study (AQSS) - A collaborative process to determine the approach to quantifying air quality changes resulting from Project development and activities. Participants included Environment Canada (EC), Metro Vancouver (MV), Tsawwassen First Nation, the Corporation of Delta, and the B.C. Ministry of Environment (MOE). EIS Table 9.2-1 summarises the AQSS process that informed the Air Quality Study; and 2. Air Quality Study – A study to identify, and where possible, quantify potential changes in air quality resulting from Project-related construction and operation activities. Details are provided in EIS Appendix 9.2-A. The main body of the Study (Main Report) is supported by independent appendices that contain a greater level of discussion on select topics, as outlined in EIS Table 9.2-1. **Addressed in EIS Appendix 7.2-B (#42):** An assessment was carried out to predict potential changes in air quality as a result of the Project. The results of the air quality assessment were used in the EIS for the assessments of human health and Current Use. The EIS air quality assessment modelled Project-related emission sources during the construction phase, and fuel combustion during the construction and operation phases, and compared them to modelled existing conditions and future expected conditions. Existing conditions considered emissions from marine vessels, trains, trucks, vehicles, and equipment from the existing Westshore Terminals, Deltaport Terminal, and BC Ferries Terminal, while emissions from industrial, commercial and residential sources within Delta were represented through measured air quality levels in Tsawwassen. A general trend of decreasing concentrations of contaminants has been observed and is expected in the Lower Fraser Valley for some criteria air contaminants, as well as for some trace organic contaminants. Coal dust is also included in the assessment of air quality in existing conditions, in the future with the Project, and in the cumulative effects assessment. Hypothetical maximum emissions scenarios were used to conservatively estimate existing conditions and potential changes from the Project. Estimated emissions and predicted ambient concentrations did not account for the inclusion of shore power as part of the Project, which is expected to decrease future emissions from ships at berth ultimately improving air quality.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 9.2 Air Quality 9.2.2.1 Purpose 9.2.5 Methods 9.2.6 Existing Conditions Table 9.2-4 Air Quality Criteria for Criteria Air Contaminants Table 9.2-5 Air Quality Criteria for Toxic Organic Contaminants 9.2.7 Expected Conditions 9.2.8 Future Conditions with the Project 9.2.9 Future Conditions with the Project and Other Projects and Activities Appendix 9.2-A Air Quality Study Main Report Appendix A - Emissions Inventory and Appendix B – Existing Air Quality Appendix C - Air Dispersion Modelling Appendix F - Ships Underway Appendix H – Westshore Coal Dust Assessment

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	#5. Asked why there would be no testing in the summer and winter months. #6. Asked why the VFPA removed the language "To assess the representativeness of T39" from draft. #7. Stated that wording regarding comparisons between test results at TFN and in T39 are not in the updated draft. Requested that in the event that there is a practical difference in the data collected at TFN and T39, and there are no port related exceedances of Ambient Air Quality Objectives, the VFPA support discussions with Metro Vancouver and all relevant stakeholders to shift the test site to TFN from T39.		Metro Vancouver, the MOE and Environment Canada. **10-Jul-2014, Meeting:** Stated that the VFPA understands Tsawwassen First Nation's concerns and that the plan has been developed in response to these concerns, as well as with input from an air quality expert. **24-Sep-2014, Letter from the VFPA:** **Comment #1** - The proposed objective was added in response to a request by [Tsawwassen First Nation] during the July 28, 2014 meeting. This objective is intended to clarify that one of the purposes of the study is to identify the potential need for additional studies based on the assessment of existing conditions on Tsawwassen First Nation land. This objective does not replace or reduce regulatory requirements for air quality assessments triggered by port related projects. The objective of the revised draft plan (attached) has been modified to emphasise it applies to current conditions. **Comment #2** - SO_x generally refers to SO_2 and SO_4 (sulphate). However, only SO_2 is considered a Contaminant of Concern as the vast majority of sulfur emissions from engine combustion are in the form of SO_2. The T39 station does not monitor SO_4, and there is no regulatory standard for other variations such as SO or SO_4. Sulphate, which typically exists in particulate form, is more generally formed in the atmosphere from the chemical transformation of SO_2 to SO_4 far from where the SO_2 was originally emitted. As such, SO_4 is more of a regional air quality issue on the scale of the Lower Fraser Valley rather than a local air quality issue for Tsawwassen. Although not reported separately, SO_4 particulates will be included in the $PM_{2.5}$ measurement. **Comment #3/4** - Westshore Terminals has confirmed their participation in the study, and is scheduled to begin simultaneous monitoring of dustfall and continuous particulate matter at the Tsatsu Shores site for the first week of October. As such, there will be simultaneous monitoring of coal related parameters at three locations during the study, including Station T39. The range of concentrations observed over a four month period should be adequate to identify potential contaminants that exceed or could potentially exceed ambient air quality standards.		

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			In addition, as described in more detail in Comment #6, a two year study would not be adequate to confirm seasonal variations between sites or in the results. On completion of the proposed sampling period, the VFPA will consult with Tsawwassen First Nation regarding the results and interpretation of the data to determine whether further study is warranted. **Comment #5** - Meteorological conditions (i.e., stronger winds) during the spring and fall season represent the most likely period for recording the highest emissions of coal dust related parameters from the storage piles at the Westshore terminal. Rainfall during winter months tends to have a suppressing effect on airborne particulates. Therefore, although summer is typically the driest period of the year, wind speeds are generally lower. Since the emission and transport of fugitive dust is closely correlated to wind speeds, the spring and autumn months offer the highest probability of measuring coal dust in dustfall samples collected on the mainland. **Comment #6** - At the request of Kristen Elkow at the July 28, 2014 meeting, the VFPA consulted with SENES (air quality consultants) on establishing statistically significant criteria within the proposed air quality monitoring program to confirm that Station T39 is representative of air quality on Tsawwassen First Nation land. As stated during the meeting, the goal is to reduce dependencies on professional judgment in the comparison. As described in the Proposed Data Analysis memo (Appendix I), a detailed statistical comparison would require at least 10 years of continuous data from each location in order to draw a statistically significant conclusion about any small trends in the concentrations of contaminants. At least five years of data would be required to detect any large trends in the data to account for site variability. However, data collected in the manner suggested for the proposed program will be sufficient to determine differences in the concentrations of air contaminants between the three sites. As outlined in Appendix I, SENES will apply statistical and graphical methods to compare the results of Tsawwassen First Nation air quality		

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			with Station T39. The language referring to the Station T39 comparison was updated to ensure the certainty of observations is not overstated. **Comment #7** - Station T39 is owned and operated by Metro Vancouver. The location of the station was determined through the DP3 Technical Working Group as the site where port-related emissions are most likely to be observed. In addition to Tsawwassen First Nation, beneficiaries include residents of Tsawwassen and Delta. As such, the VFPA cannot support moving the station without adequate technical justification and the consultation of other stakeholders who may be impacted by the decision. However, the VFPA is willing to support discussions on further air quality studies in partnership with Metro Vancouver based on the outcome of the current study. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, including Section 9.2 on the air quality assessment.		
TFN-1.3	Asked what kind of effect air quality is having on port employees working at Roberts Bank.	18-Nov-2013, Community Meeting	**18-Nov-2013, Meeting:** Stated that this type of information is usually covered under provincial health and safety standards. **15-Jan-2014, Letter from the VFPA:** The VFPA does not track or have access to medical records of terminal employees. The health of workers is protected under provincial occupational health and safety regulations and air quality standards, with which individual terminal operators are required to comply.		
TFN-1.4	Asked whether the VFPA knows how far pollution spreads from the terminal and whether studies have been conducted on this topic. Suggested that people will move away from the area due to increased pollution.	27-Nov-2013, Community Meeting	**27-Nov-2013, Meeting:** Stated that as part of the EA, the local assessment area (LAA) consists of the geospatial areas that the studies take place in [and captures the extent of possible changes to air emissions as a result of the Project]. **15-Jan-2014, Letter from the VFPA:** The VFPA has conducted a number of air quality studies, including the DP3 Environmental Assessment (2005) and the Delta Terminal Road and Rail Improvement Project Environmental Assessment (2012). In both studies air quality was found to meet applicable air quality standards and objectives. A study is also currently underway to assess potential RBT2-related emissions. **01-Apr-2015, Letter from the VFPA:**	**Addressed in EIS Appendix 9.2-A:** EIS Appendix 9.2-A includes dispersion modelling of Project-related emissions. The extent of emissions is shown on updated figures in the response to IR6-24 and IR6-27. **Addressed in EIS Appendix 7.2-B (#42):** The Project is not expected to result in any significant adverse effect on human health, including from changes in air quality. **Addressed in response to IR-7.31.15-25-19:** In response to IR-7.31.15-19, the VFPA provided Appendix IR19-A (Air Quality and Human Health Risk Assessments Based on Provincial Interim NO_2 and SO_2 Objectives). Appendix IR19-A provides updated analyses and results for the EIS Section 9.2 and supporting EIS Appendix 9.2-A, which informs updates to the air quality human health risk assessment (AQ HHRA) presented in EIS Appendix 27-A. The updates reflect new B.C. Ministry of Environment interim air quality objectives for 1-hour average nitrogen dioxide (NO_2) and sulphur dioxide (SO_2) objectives. The response concludes that the residual effect to human health related to changes in air quality is expected to be not significant, which is consistent with conclusions in EIS Section 27.9.2.1. The predicted significance of effects on potential or established Aboriginal	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 9.0 Physical Setting 9.2 Air Quality 9.2.5 Methods 9.2.6 Existing Conditions Table 9.2-4 Air Quality Criteria for Criteria Air Contaminants Table 9.2-5 Air Quality Criteria for Toxic Organic Contaminants 9.2.7 Expected Conditions 9.2.8 Future Conditions with the Project

			Provided a copy of the EIS, including Section 9.2 on the air quality assessment.	and treaty rights and related interests, including Current Use related to air quality is also expected to remain unchanged from the conclusions provided in EIS Section 32.2.6.4. **Additional information provided by the VFPA:** During operation, Project-related exposures to air emissions are not predicted to result in measurable health effects. During construction, a minor health effect is predicted for a small area over water between the Westshore and RBT2 terminals, where public access is not likely. Therefore, health effects during construction are unlikely to occur. Air quality will be monitored during construction and operation, and there would be adaptive measures should Project emissions result in exceedance of ambient air quality objectives or criteria.	9.2.9 Future Conditions with the Project and Other Projects and Activities Appendix 9.2-A Air Quality Study Main Report Appendix B – Existing Air Quality Appendix C - Air Dispersion Modelling Appendix F - Ships Underway Appendix H – Westshore Coal Dust Assessment 27.0 Human Health 27.9.2.1 Air Emissions 32.2 Current Use of Land and Resources for Traditional Purposes Assessment 32.2.6.4 Potential Effect 4: Changes in Quality of Current Use Experience **Information Requests** Response to Information Request #19 (IR-7.31.15-19 of CEAR Document #314) Appendix IR19-A Air Quality and Human Health Risk Assessments Based on Provincial Interim NO_2 and SO_2 Objectives Response to Information Request #20 (IR-7.31.15-20 of CEAR Document #314)
TFN-1.5	Asked about the regulation of trains in comparison to trucks, with respect to emissions.	27-Nov-2013, Community Meeting	**27-Nov-2013, Meeting:** Stated that the VFPA has more of an interface with trucks than the rail system. Noted that the current status of the standard for emissions for railways is not known [by the speaker]. **15-Jan-2014, Letter from the VFPA:** The VFPA is committed to continuous improvement in terms of reducing air emissions that contribute to air quality and climate change through its Air Action Program. This includes all port sectors such as ships, trucks, trains, cargo handling equipment and administration. Because each sector is unique in terms of both how it is regulated and the relationship with the VFPA, the approaches taken to reducing emissions vary. Example initiatives include the EcoAction Program for ships, the Truck License System	**Additional information provided by the VFPA:** The latest MOU with Transport Canada originally covered the period of 2011 to 2015, and was extended until the end of 2017. It sets a 7.2% reduction target for GHG emissions intensity — from 2010 levels — for Class 1 freight railways and intercity passenger rail; a 3.6% GHG emissions intensity reduction target for shortline railways; as well as standards for CAC emissions. The Railway Association of Canada publishes an annual, peer-reviewed report summarising the progress that railways have made towards meeting these targets, and highlighting the actions that the industry has taken to reduce emissions. The program is audited by an independent and accredited firm to ensure both data integrity, and that the terms and conditions of the MOU are being observed. More information is available at https://www.railcan.ca/rac-initiatives/locomotive-emissions-monitoring-program/	**EIS** 9.0 Physical Setting 9.2 Air Quality 9.2.5 Methods 9.2.6 Existing Conditions Table 9.2-4 Air Quality Criteria for Criteria Air Contaminants Table 9.2-5 Air Quality Criteria for Toxic Organic Contaminants 9.2.7 Expected Conditions 9.2.8 Future Conditions with the Project

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			Environmental Requirements for container trucks and the currently-in-development Non-Road Diesel Emissions Initiative for cargo handling equipment, among others. Both rail and harbour craft are two sectors where the VFPA has a more limited ability to influence emissions. Due to the existence of the VFPA's Truck Licence System which requires any container truck accessing the port to have a valid license or permit, starting in 2008 increasingly stringent environmental requirements were put in place, which will bring the fleet up to a 2007 or equivalent truck $PM_{2.5}$ emission rate by 2017, consistent with the Northwest Ports Clean Air Strategy. With regards to fuel quality and engine emission standards for both on-road heavy duty vehicles and locomotives, these are regulated by the Federal Government. Fuel sulphur content limits for both sectors have been gradually decreasing, reducing emissions of both SO_x and PM, while engine emission standards have over time also lowered emission rates of various criteria air contaminants such as PM and NO_x. Additionally, in 2013, the Federal Government announced regulations that would introduce progressively stringent greenhouse gas emission limits for new on-road heavy duty vehicles. While similar requirements do not exist for locomotives, by virtue of its greater efficiency compared with trucks, rail transport has lower greenhouse gas emissions per tonne-km of cargo moved. Separately, the Railway Association of Canada, its member companies and Transport Canada have a Memorandum of Understanding for reducing locomotive emissions of both criteria air contaminants and greenhouse gases during the 2011-2015 period. This agreement builds on previous similar agreements covering 1995-2005 and 2006-2010 periods.		9.2.9 Future Conditions with the Project and Other Projects and Activities Appendix 9.2-A Air Quality Study Main Report Appendix B – Existing Air Quality Appendix C – Air Dispersion Modelling Appendix F – Ships Underway Appendix H – Westshore Coal Dust Assessment **Railway Association of Canada** https://www.railcan.ca/rac-initiatives/locomotive-emissions-monitoring-program/
TFN-1.6	Concerned that because RBT2 is a large development, there will be an increase in emissions from trucks, trains, ships, etc., unless the Project goes electrical. Concerned that emissions from trucks, trains, and ships related to the Project will contribute to a negative cumulative impact on air quality from	27-Nov-2013, Community Meeting	**27-Nov-2013, Meeting:** Noted that there is no plan at this point for electrical trucks, but low emission [requirements] for equipment on the terminal. The VFPA anticipates the majority of ships will be able to plug into shore power and therefore will not be sitting with their diesel generators on while at berth. It is noted that new technology and drive for low emissions will be used when possible. It is noted that part of the VFPA's program is to optimise the number of truck trips as to avoid empty trucks.	**Addressed in EIS Appendix 7.2-B (#42):** The assessment concludes that: • Air quality will improve in the future, with or without the Project, as a result of improvements in engine technologies and the use of cleaner fuels. • Cumulative changes, incorporating the Project and other certain and reasonably foreseeable projects and activities, are predicted to be small relative to expected future ambient air quality levels. • Project construction activities are predicted to cause a small increase in concentrations of some contaminants. • Criteria air contaminant (i.e., carbon monoxide, nitrogen oxides, sulphur dioxide, particulate matter, and ground-level ozone) and trace organic contaminant (i.e.,	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 9.0 Physical Setting 9.2 Air Quality 9.2.5 Methods 9.2.6 Existing Conditions Table 9.2-4 Air Quality Criteria for Criteria Air Contaminants

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	other projects and developments in the region (including those of TFN).		**15-Jan-2014, Letter from the VFPA:** Currently there is no plan for electrical trucks as part of the proposed Project, however all Ship to Shore Gantry Cranes, Container Yard Stacking Cranes and Intermodal Yard Rail Mounted Gantry Cranes will be electrically powered. The VFPA anticipates the majority of ships will be able to plug into shore power and therefore will not be sitting with diesel generators on while at berth. New technology that will reduce emissions will be used when possible. Part of the VFPA's Smart Fleet Trucking Strategy is to optimise the number of truck trips to avoid empty trucks. The VFPA, industry and government are jointly funding research, through the Clean Transportation Initiative, to identify technology based solutions to improve the efficiency and environmental performance of marine terminals and trucks. The VFPA understands that there has been movement in the rail business to address emissions within the rail system as well. As part of the EA for the proposed Project, the VFPA will undertake an air quality assessment which will focus on concerns pertaining to human health considerations and climate change. As part of this assessment, potential effects related to the project and associated mitigation measures will be determined. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	formaldehyde and other contaminants related to fuel combustion) levels are predicted to be below air quality criteria on land, with limited exceptions. • The Project is expected to have a negligible effect on future ozone levels and to increase greenhouse gas emissions (i.e., carbon dioxide, methane, and nitrous oxide). • Although Project activities would emit black carbon, black carbon is expected to decrease in the future with the Project due to equipment fleet turnover at existing Roberts Bank terminals to newer engines that meet more stringent emission standards for particulate matter. The benefits of existing initiatives are realised in the existing emissions monitored at local air quality stations in Metro Vancouver. Future benefits, such as improvements in fuel, are described based on their anticipated level of benefit to future air quality emissions, in EIS Section 9.2.7.	Table 9.2-5 Air Quality Criteria for Toxic Organic Contaminants 9.2.7 Expected Conditions 9.2.8 Future Conditions with the Project 9.2.9 Future Conditions with the Project and Other Projects and Activities Appendix 9.2-A Air Quality Study Main Report Appendix A – Emissions Inventory Appendix B – Existing Air Quality Appendix C – Air Dispersion Modelling Appendix F – Ships Underway Appendix H – Westshore Coal Dust Assessment
TFN-1.7	Concerned with the effects of potential changes in air quality to fisheries.	25-Apr-2014, Interview	**25-Apr-2014:** Recorded comment for consideration by Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, including Appendix 27-A.	**Additional information provided by the VFPA:** An assessment of potential effects of air emissions on shellfish is provided in EIS Appendix 27-A. The multi-media assessment presented in EIS Appendix 27-A considered deposition of non-volatile chemicals to soil, sediment and plants and determined exposure as a result of direct contact with these media as well as the consumption of plants, livestock or wildlife consuming or in direct contact with these media. All of the maximum risk quotient (RQ) values determined for the multi-media exposure assessment were below one and therefore no adverse health effects are expected from the exposure of Tsawwassen First Nation and farmer receptors to non-volatile Compounds of potential concern (COPCs) in Project emissions that could occur in media other than air. The VFPA's response to IR12-04, as requested by the Review Panel, will further discuss potential effects on human health from marine resource contamination for both Indigenous and non-Indigenous populations. Information regarding potential effects of air pollution on marine mammals is provided in the response to IR5-38. Potential health effects to marine mammals from air pollution in the LAA due to the incremental contribution of marine shipping associated with the Project are not anticipated; therefore, this potential effect was determined to be negligible in MSA Section 8.2.6.1.	**EIS** 27.0 Human Health Appendix 27-A Air Quality HHRA Technical Report **Marine Shipping Addendum (MSA, CEAR Document #316)** 8.2 Marine Mammals 8.2.6.1 Negligible Effects **Information Requests** Response to Sufficiency Information Request #38 (IR5-38 of CEAR Document #1159) Response to Sufficiency Information Request #4 (IR12-04)

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-1.8	Stressed the importance of modelling potential effects with consideration given to the fact that the future population of TFN is likely to be larger. Stressed the uncertain nature of environmental assessments and the need for decision makers to understand where any uncertainty lies.	12-Jul-2016, Meeting	**12-Jul-2016, Meeting:** Requested that Tsawwassen First Nation submit any questions on air quality and the VFPA would follow-up.	**Addressed in EIS Section 9.2:** All areas of Tsawwassen First Nation lands have been included in the air quality study for the Project. The air quality study made note of the areas of uncertainty associated with estimating emissions from both existing and projected future operations of marine terminals at Roberts Bank. Hypothetical worst-case assumptions about emissions were used in the air quality study, such that the modelled air quality levels for existing conditions in 2010 overestimate actual observed air quality levels by a factor of two. Similar conservative assumptions were used for the expected (without RBT2) and future (with RBT2) emission scenarios in 2025, such that the conservative over estimation of potential changes in air quality was carried forward. As such, actual air quality levels are expected to be better than those indicated in the EIS.	**EIS** 9.2 Air Quality
TFN-1.9	Stated that the EA states that as a conservative measure, study criteria were selected based on the most stringent criteria from federal and provincial objectives or standards and that regional objectives and standards are only provided for comparison purposes. Regional objectives are lower than federal and provincial objectives in some instances and should also be included. Requested the inclusion of Regional objectives or standards for selecting the most stringent criteria.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 9.2:** There are three separate jurisdictions within the Local Study Area (LSA) for the Project: Metro Vancouver in Delta up to the Georgia Strait shoreline, provincial in all areas of Georgia Strait on the Canadian side of the border, and Washington State south of the Canada-U.S. border. Since the highest predicted concentrations in the air quality assessment occur near the Roberts Bank terminals which fall within provincial jurisdiction, it would be inappropriate to apply Metro Vancouver's ambient air quality objectives at those locations. Similarly, it would be inappropriate to apply Metro Vancouver's objectives in Point Roberts. Nevertheless, Metro Vancouver's objectives are listed in all tables listing the predicted concentrations at discrete receptor locations so that reviewers of the report can compare the results to both the study criteria, Metro Vancouver's objectives and, for locations in Point Roberts, to National Ambient Air Quality Standards in Washington State.	**EIS** 9.2 Air Quality
TFN-1.10	Stated that the GHG assessment must include the six greenhouse gases listed in the Greenhouse Gas Reduction Target Act (GGRTA). PFCs, HFCs, SF6 should be added to the CO2, CH4 and NO2 already listed. Requested that the VFPA confirm that PFCs, HFCs, SF6 will be assessed.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 9.2:** Emissions of the three main fluorinated gases (hydrofluorocarbons (HFCs), perfluorocarbons (PFCs) and sulphur hexafluoride (SF6) are almost all created by humans and are used mainly in industrial processes. Fluorinated gases are used inside of products like refrigerators, air-conditioners, foams and aerosol cans. Emissions from these products are caused by gas leakage during the manufacturing process, as well as throughout the product's life. Fluorinated gases are also used for the production of metals and semiconductors. PFCs, HFCs and SF6 were not listed as contaminants of potential concern in the *EIS Guidelines* issued by the CEA Agency for the Project assessment and are not contaminants that would be emitted from the sources evaluated in this assessment.	**EIS** 9.2 Air Quality
TFN-1.11	Requested the use of traffic estimates from "Projections of Vessel Calls and Movements at Deltaport and Westshore	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 9.2:** Estimates of the number of ship calls at existing Deltaport Terminal and Westshore terminals that were included in the air quality modelling are provided in EIS Appendix 9.2-A, Appendix A, Section 2.2. Vessel traffic projections were are also provided in EIS Appendix 4-D Roberts Bank Traffic Data Matrix.	**EIS** 9.2 Air Quality

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Terminals" for calculating effects.				
TFN-1.12	Stated that activity levels should include increased traffic associated with Tsawwassen Mills development.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 9.2:** The results of emissions estimates and modelling conducted for expected conditions (future without the Project) in 2025 are summarised in EIS Section 9.2.7, and additional details are provided in EIS Appendix 9.2-A (emission estimates and modelling results), Appendix A (emissions estimating methods) and Appendix D (modelling results for CACs and TOCs). Activities considered in the assessment of expected conditions include future activity levels at the existing Roberts Bank terminals, and BC Ferries Terminal operations. Other future land-based activities, including traffic associated with the Tsawwassen Mills development, were not included in the modelling because the conservative modelling approach, resulting in overprediction of air emission concentrations, accounts for emissions from other potential sources in the future. The conservative overestimation of air contaminant concentrations in dispersion modelling is described in EIS Section 9.2, and the response to IR6-22.	**EIS** 9.2 Air Quality 9.2.7 Expected Conditions Appendix 9.2-A Main Report Appendix A – Emissions Inventory Appendix D – Additional Results **Information Requests** Response to Sufficiency Information Request #22 (IR6-22 of CEAR Document #1188)
TFN-1.13	Asked if all sensitive receptors identified as being important to the TFN been included as 'Discrete Receptors' (schools etc.). Requested the identification and list of appropriate receptors on TFN lands used in the assessment.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 9.2:** Eighteen discrete receptors were chosen as representative reference points to assist in the discussion of the assessment results. The discrete receptor locations are shown in EIS Figure 9.2-3. As noted in the figure, R3, R4 and R6 receptor locations are located within Tsawwassen First Nation Lands. **Addressed in Response to IR6-14:** The response to IR6-14 provides information on predicted air contaminant concentrations at two additional receptors, including a residential location on Tsawwassen First Nation Lands, and the English Bluff Elementary School.	**EIS** 9.2 Air Quality Figure 9.2-3 **Information Requests** Response to Sufficiency Information Request #4 (IR6-14 of CEAR Document #1188)
TFN-1.14	Stated that while background ozone may exceed established criteria, the 98th percentile background air quality concentrations should still be included to assess potential air quality on those 7 days a year which would represent the worst air quality conditions to be expected. Requested the inclusion of 98th percentile for ozone, regardless of whether background concentrations exceed the criteria.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 9.2.6.1:** The background concentrations of ozone for 1-hour, 8-hour, 24-hour, and annual averaging periods used in the Air Quality Study are provided in EIS Section 9.2.6.1, Table 9.2.10. To clarify, the predicted concentrations of ozone and maximum overland concentrations as a percentage of study criteria (i.e., National Ambient Air Quality Standards for 24-hour and annual periods), include the background concentrations (see Tables 9.2.10 and 9.2.27 as examples). Since these background concentrations for these averaging periods exceed their respective criteria, the discussion focuses on the relative incremental change (i.e., without the inclusion of 98th percentile background air quality concentrations) to assess changes in air quality associated with the Project.	**EIS** 9.2 Air Quality 9.2.6.1 Background Air Quality Concentrations Appendix 9.2-A Air Quality Study
TFN-1.15	Stated that predicted maximum concentrations for each receptor did not include background concentrations (to allow for a more meaningful comparison).	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 9.2.6.2:** Predicted concentrations are presented in the results tables without background concentrations to allow for a more meaningful comparison of future changes associated with other activities and projects (i.e., expected conditions) and associated with the Project. In some cases, the background concentrations are much higher than increases associated with expected conditions and future conditions with the Project, so differences would be difficult to discern if background concentrations were incorporated in the tables.	**EIS** 9.2 Air Quality 9.2.6.2 Modelling of Existing Conditions Appendix 9.2-A Air Quality Study

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Stated that values should be provided including the background concentration to provide an easier comparison for TFN members.			Nevertheless, all concentrations represented on the isopleth plots include background concentrations, as per the *2015 British Columbia Air Quality Dispersion Modelling Guidelines* (B.C. MOE 2015). As explained in the response to IR6-23, comparisons are provided to the air quality criteria relevant to the location (i.e., over land in Metro Vancouver or U.S. jurisdiction, or over water), with areas exceeding the applicable criterion shaded in yellow.	**Information Requests** Response to Sufficiency Information Request #23 (IR6-23 of CEAR Document #1188)

Table 2: Alternative Means of Carrying out the Project

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-2.1	Stated that an initial scoping exercise that the VFPA did 3 or 4 years ago proposed an automated rail transfer system, all onshore. Stated that 60 per cent of the RBT2 proposed footprint is intermodal yard and stated that if this was reduced, the impact would be correspondingly decreased. Asked for more information on the work that the VFPA has done on footprint designs to see why this particular option has been selected over others. Asked about consideration of an earlier proposal for a conveyor system at Roberts Bank that would eliminate the need for land creation. Stated that the EIS confirmed that an on-land Intermodal Yard (IY) alternative to the project is both technically and economically feasible (page 5-17). Despite acknowledging the feasibility of the alternative, the EIS does not include an assessment of the environmental effects of the alternative. Requested an environmental effects analysis of on-land IY option.	03-Dec-2012, Meeting 05-May-2015, Meeting 15-Jun-2015, Letter to the CEA Agency (CEAR Document #231)	**03-Dec-2012, Meeting:** Explained that the process has changed from 4 to 5 years ago when these initial studies took place, as a result of the economic downturn. Stated that the VFPA has moved forward with a different strategy. Initially, it was thought that the VFPA would partner in a design build contract for the terminal. The other partner would take some of the risk in getting the Project approved. This is no longer happening and the VFPA is proposing the Project alone. Stated that the intermodal yard will be not quite 60% of terminal footprint. Stated that the current design is for a semi-automated terminal. Stated that the current proposed location is a balance between design, location and engineering. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 5.0 on alternative means. **05-May-2015, Meeting:** Noted the conveyor proposal is outside of the VFPA's jurisdiction. Referred to EIS Section 5.0, which includes some of the alternatives analysis that was undertaken. Noted consultation took place in 2012 regarding configuration for the terminal, including location of the intermodal yard on the causeway, marine terminal, or agricultural land reserve. Explained that the causeway option was selected because it had the least impact. **30-Sep-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Agency has requested additional information on Intermodal Yard locations in its letter of July 31, 2015 to [the VFPA] (page 8, #15)."*	**Addressed in EIS Section 5.0:** The consideration of alternative design configurations and construction approaches resulted in the preferred Project design presented and assessed in EIS Section 5.0. A number of location, orientation, layout and configuration alternatives were considered and assessed for the marine terminal (including berth pocket and marine approach areas), causeway, rail and road corridors, and the tug basin. The effects of feasible alternatives were considered based on their potential to directly or indirectly affect natural and human environment components. The anticipated effects were considered key factors when comparing and determining preferred means. **Addressed in Response to IR1-06:** In the case of the intermodal yard, the Project conceptual design included an intermodal yard on the marine terminal, which was consistent with the standard on the west coast of Canada, and is an emerging trend on the west coast of North America. This is supported by the Ocean Shipping Consultants' Container Traffic Forecast Study 2014 which states, "… the costs associated with trucking containers from terminals to rail yards were obviously highly uncompetitive. Hence there has been a switch in favour of on-dock facilities, and all new container terminals on the west coast either incorporate such a facility or provide on-dock access to an adjacent rail yard". Deltaport, the existing container terminal at Roberts Bank, has an on-terminal intermodal yard, and in order for RBT2 to be a cost competitive facility for an operator, the Project would need to provide the same terminal facilities. An intermodal yard off-terminal would require extra container handling and incur drayage charges for the transport of each container to the intermodal yard, a competitive disadvantage for any potential future operator unless the facility accommodated both terminals. During the conceptual design phase of the project, consultation between the VFPA and stakeholders such as the operating railways, existing terminal operators and the provincial government (the owner, through BC Railway Company, of the lands that would be required to accommodate a land-based intermodal yard) was ongoing related to the current and future needs of port facilities at Roberts Bank. Alternative rail configurations serving Roberts Bank were considered, including an intermodal yard on the Roberts Bank Causeway, and a land-based intermodal yard. These facilities were considered as a means of addressing rail and terminal operational requirements such as capacity, efficiency, bad order car repair and locomotive refuelling, and if implemented, would have needed to be able to provide service to both terminals (i.e., capable of being expanded to handle 4.8 million TEUs if RBT2 were approved). As described in the EIS, an on-causeway intermodal yard was determined to be not economically feasible. Third party consideration of a land based intermodal yard continued in the ensuing years. The implementation of this facility would have needed to be a cost-efficient business proposition for the operating railways and the marine terminal operator, with the cost-savings of such a facility outweighing the extra handling and drayage costs required for its operation.	**EIS** 5.0 Alternative Means of Carrying out the Project **Information Requests** Response to Sufficiency Information Request #06 (IR1-06 of CEAR Document #897)
TFN-2.2	Asked for more information on alternatives. Criticised that the VFPA's jurisdiction may have limited	03-Dec-2012, Meeting 05-May-2015, Meeting	**03-Dec-2012, Meeting:** Stated that the Project is not about engineering designs at this stage, it's about what the Project involves. Noted that through the EA process the Project will get more defined.	**Addressed in EIS Section 5.0:** The W1 (0 m) terminal layout is the preferred configuration for a terminal at Roberts Bank due to fewer direct and indirect environmental effects relative to other alternatives considered. In addition to reducing impacts in the intertidal	**EIS** 2.0 Project Overview 2.2.5 Current Canadian West Coast Container Traffic Forecasts

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	the scope of the alternatives assessment. Stated that the alternatives analysis is insufficient. Concerned that the options analysis and business case components of the documentation TFN has reviewed are insufficient. Stated that TFN is of the view that the business case components of the documentation TFN has reviewed is insufficient; TFN is not convinced that RBT2 is needed to accomplish federal objectives for growth in container trade.	01-Sep-2016, Letter	**01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 5.0 on alternative means. **05-May-2015, Meeting:** Stated that six alternative locations for the terminal and causeway were considered. **15-Sep-2016, Letter from the VFPA:** Noted that under the *Canadian Environmental Assessment Act* (*CEAA, 2012*), a proponent is required to consider alternative means of carrying out the designated project that are technically and economically feasible and the environmental effects of any such alternative means. As part of the alternatives analysis required under *CEAA, 2012*, the VFPA considered alternative design configurations and construction approaches for the proposed terminal including the configuration conceptually shown in Schedule "A" of the 2004 MOA. The VFPA determined that locating the terminal almost entirely in subtidal waters not only reduced impacts to valued environmental intertidal habitat but also minimised dredging.	area, the W1 (0 m) alternative was determined to have the least amount of dredging required. Following selection of Option W1 (0 m) as the preferred alternative, further engineering studies were conducted to optimise the preliminary terminal design, which resulted in rounding the northwest corner to further reduce Project-related effects of bed scour post construction. The optimised configuration incorporated into the preliminary Project design is shown on EIS Figure 5-4. The reduction of Project-related effects as a result of this optimisation is discussed in EIS Section 5.4.1.3. The widened causeway without the lagoon was determined to be the preferred option as it will minimise intertidal habitat loss amongst the alternatives considered, and will have the least amount of indirect habitat change from altered coastal geomorphic processes. The widened causeway was further optimised by varying widths to minimise effects to the known biofilm intertidal habitat at the east end of the causeway. The preferred alternative for the intermodal yard is on the marine terminal. The preferred alternative for the rail tie-in is to have one of the two tracks join the main rail network outside the VFPA's jurisdiction to reduce intertidal habitat loss (by approximately 0.32 ha) with a narrower width at the northeast end of the causeway. The tie-in to the existing road corridor at Roberts Bank Way North via a new overpass and access road to the marine terminal was the only technically and feasible alternative considered. The preferred option for the location of the tug basin is to expand the existing tug basin with a configuration adjacent to the existing Deltaport Terminal. If the tug basin was placed on the north shore of RBT2, the footprint would affect higher-valued intertidal habitat than at the existing Roberts Bank tug basin location, and the shoreward tug-basin expansion layout at the existing tug basin would result in a higher potential for alterations in tidal flow and the potential for water ponding between the tug basin and Deltaport Terminal. For construction, no alternatives for dredging, temporary sand storage, or construction of supporting land were considered technically or economically feasible. The caisson wharf structure is the preferred alternative to pile and deck wharf due to the reduced noise effects, public opinion, improved seismic performance, and costs. Disposal of sediments at the Project-specific location is the preferred alternative to reduce transportation-related effects and costs. Lastly, as tug wharves constructed using the fill or pile and deck options would result in greater effects to habitat from a larger footprint, the floating pontoons and piles option is preferred. The preferred alternative for each category is described in detail in EIS Section 4.0 Project Description. The detailed assessment of the preferred alternative (i.e., the Project) is presented in subsequent sections of the EIS. **Addressed in response to IR1-06:** For each marine terminal alternative location considered in EIS Section 5.3, Table IR1-06-1 in Appendix IR1-06-A summarises the criteria used to assess technical feasibility and provides the conclusion of the feasibility assessment along with supporting rationale. To be considered technically feasible, potential alternatives to the location of the marine terminal within B.C. needed to first meet all technical criteria (as stated in EIS Section 5.2), which included the following:	2.2.6 The Container Capacity Improvement Program: Meeting Increasing Demand for Containerised Trade 5.0 Alternative Means of Carrying out the Project **RBT2 Meeting Canada's Trade Demand – Project Rationale** http://www.robertsbankterminal2.com/wp-content/uploads/RBT2-Project-Rationale-March-20151.pdf Ocean Shipping Consultants 2016 Container Traffic Forecast Report http://www.robertsbankterminal2.com/wp-content/uploads/2016-Ocean-Shipping-Consultants-Container-Forecast.pdf **Information Requests** Response to Sufficiency Information Request #06 (IR1-06 of CEAR Document #897)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				• Meeting the long-term container capacity growth by the mid-2020s, through operating efficiencies and a sufficient land base to accommodate growth; • Meeting the requirement for the necessary road and rail connections to efficiently transport containers to and from the market; and • Providing the ability for larger container ships to safely navigate the waterways. Safe navigation includes a minimum berth depth requirement of approximately 18.4 m and the ability to safely turn the vessel around, even in situations of sufficient draught. In addition, consideration was given to terminals with other uses (e.g., serving bulk or break-bulk markets) and if they could retain these capabilities if conversion to container handling was undertaken. The marine terminal location alternatives evaluated (including a combination of these alternatives) were determined not to be technically feasible, and therefore, an evaluation of economic feasibility was not conducted, and an assessment of environmental effects was not required. Based on the analyses of the location alternatives (see Table IR1-06-1), RBT2 was deemed to be the only viable option to meet the anticipated long-term growth and demand of containerised trade on the west coast of Canada, and a full assessment of environmental effects on this preferred alternative was conducted and is described in the EIS. **Addressed in Table IR1-06-1 (Appendix IR1-06-A):** The feasibility of the following potential alternatives for the location of the marine terminal were assessed based on the four criteria noted above. Increase capacity at Deltaport Terminal Additional capacity by 2017 through the Deltaport Terminal Road and Rail Improvement Project will help to meet short-term container demand, but it does not satisfy long-term container demand requirements. Additional development eastward at Roberts Bank is not possible based on prior feedback from regulators (see Appendix IR1-06-B). Increase capacity at Centerm A proposed expansion may add up to 600,000 TEUs to meet near-term capacity constraints, but not long-term demand as expansion possibilities are limited by rail constraints within the south shore of Burrard Inlet. Increase capacity at Vanterm This site was upgraded in 2005 to increase container handling capacity in the near term. Equipment modernisation in the near term may add some additional capacity (~200k TEU). Further expansion at this site to increase long-term capacity would not be possible until at least the late 2020s due to existing lease tenures. In addition, expansion possibilities are limited by rail constraints within the south shore of Burrard Inlet. Increase capacity at Fraser Surrey Docks (FSD) The current capacity at FSD is less than 100,000 TEUs per year from small to mid-sized container ships. Most container vessels currently calling at VFPA terminals cannot be accommodated within the Fraser River channel due to their draught requirements and length (the latter of which limits the ability to turn around to return down river). This constraint limits the future technical viability of FSD as even larger container vessels are expected to call at VFPA terminals. Combined increases at existing VFPA terminals	

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				From current or planned improvement or expansion projects, short-term demand will be met, but combining projects at all existing locations will still not achieve long-term growth demands. Lynnterm Conversion Feasibility studies were previously conducted in the early 2000s to evaluate the conversion from bulk/break-bulk to a container terminal. The VFPA is committed to facilitating multiple types of trade. The existing tenant is considering conversion to a grain terminal not to a container terminal. In addition, road access is constrained in North Vancouver. Richmond Properties Currently used as an off-dock transload and distribution centre in the City of Richmond, expansion of this site has very little potential due to navigation constraints associated with larger container ships and road and rail constraints due to its urban location. Based on these constraints and Current Use requirements, long-term capacity growth could not be accommodated at this location and conversion of this facility is unfeasible. Build a new terminal within VFPA jurisdiction (Construct a new terminal at Roberts Bank) This alternative meets all the technical criteria. Prince Rupert Port Authority (PRPA) – Fairview Terminal Phase 2 Expansions The Stage 1 and Stage 2 expansions have been incorporated into the projections of growth to 2030, and therefore these expansions are not an alternative for providing the additional capacity required in the long-term. PRPA – Ridley Terminal Currently operating as a coal export terminal, there are no plans to convert this terminal from bulk handling to containers. Other areas at the terminal are optioned by PRPA for dry and liquid bulk export facilities, and there are no other conversion or expansion opportunities PRPA – Watson Island The site is currently being explored by Watson Island LNG for development of a small LNG facility. Current infrastructure is limiting, as it has limited draught and only one dock, thereby ruling out larger container ships. **Addressed in EIS Section 2.0:** Additional information about the business case for the Project is provided in the EIS Section 2.0, as well the Project Rationale. **Additional information provided by the VFPA:** All levels of government have plans to capitalise on a growing global economy, which requires Canada to be prepared for the trade that will come to Canadian ports. At the Port of Vancouver, we handled a record 3.25 million 20-foot-equivalent unit containers (also called TEUs) in 2017. Historical trade figures and third-party forecasts have long signalled that the ability of west coast ports to serve this growth is becoming constrained, and by the mid-2020s we will not have the capacity to handle anticipated future growth of trade in containers at the Port of Vancouver The role of the VFPA is to ensure the port is ready for Canada's trading future. As we plan, we must consider how to provide needed port facilities within a growing metropolitan area. To date, we have partnered with industry, governments, and communities to improve road and rail networks, investing to help goods flow smoothly throughout our region. We have also consulted	

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				with local governments, Indigenous groups, and residents on the ways we can grow responsibly. Investments in increased size and improved efficiency are being, or have been, made to west coast container terminals, including recent improvements at the Port of Vancouver's Deltaport, Canada's largest container terminal, and Fairview in Prince Rupert. However, even with these investments, we will not have enough space to accommodate the shortfall in needed capacity. The RBT2 Project represents the best option to accommodate growth and is needed to deliver the capacity we need as demand for goods shipped in containers continue to grow. Since 2011, the port authority has commissioned independent forecasts which consider many factors that influence container traffic demand, including: • Gross Domestic Product growth; • World demand for Canadian resources; • Increased consumer demand for trade with Asia; • Opening of the expanded Panama Canal; • Planned container terminal expansion at the Port of Prince Rupert; • Macroeconomic trends in North America; • North American container port demand and competitive developments; • Trends in container shipping; and • Vancouver's competitive position compared to other North American ports. The 2016 Ocean Shipping Consultants forecast shows continued growth in container trade through the west coast of Canada at a compound annual growth rate of about 4%, and reinforces the need for planned increases of capacity to ship goods in containers through the existing container terminals in Vancouver and the Fairview Terminal in Prince Rupert. The 2016 Ocean Shipping Consultants forecast also confirms that the proposed Project will be needed by the mid-2020s.	
TFN-2.3	Expressed the view that TFN should have been consulted earlier in the siting of the intermediate transfer pit (ITP). Concerned that the alternatives analysis is driven by the business case and not environmental implications. Asked about alternatives to the ITP (timing, location, direct placement) that were evaluated. Asked the VFPA to confirm that they are willing to discuss and explore alternatives to the ITP with TFN in good faith. Requested to replace the use of the ITP with a land-based	12-Feb-2015, Meeting 03-Mar-2015, Meeting 05-May-2015, Meeting 15-Jun-2015, Letter to the CEA Agency (CEAR Document #231) 20-Sep-2015, Letter 29-Apr-2016, Meeting 19-Jul-2016, Issues Workshop - Musqueam First Nation /	**12-Feb-2015, Meeting:** Noted the ITP had been included in other RBT2 materials previously provided to Tsawwassen First Nation. A review of impacts was done and there are mitigation measures proposed which will be described in the EIS. [Following concerns raised at this meeting, the VFPA and Tsawwassen First Nation scheduled a follow-up meeting on 03-Mar-2015 to specifically discuss the ITP]. **03-Mar-2015, Meeting:** Explained that at a high level, the ITP was chosen because of seabed depth; it allows for deposition of a higher quantity of material and for barges to manoeuvre. It is noted that the area in the intertidal area would not meet the criteria. The same rationale was used to support ITP use for DP3. There is indication of the recovery of species in the area and no long-term impacts as a result of DP3 ITP utilisation. There are minimal long-term effects on the area considering all of the many complex construction elements. It was noted that an attempt was made to avoid the other side of the causeway because of water depth and the eelgrass beds. There is an opportunity to bring	**Addressed in PCU:** As requested by the Review Panel, the VFPA submitted the PCU on June 12, 2018, providing: • Detailed revised Project description, including a revised construction schedule; • Revised Project interaction matrix; • Preliminary details pertaining to the management and timing of dredging activities and the discharge of sediment-laden water; and • Revised assessment of environmental effects as required by the Project modifications. PCU Sections 1.0 and 2.0 describe the changes to the EIS, including updates to specific construction activities, the construction schedule, and relevant Project Description figures and appendices. In PCU Section 3.0, changes or effects resulting from the construction updates on intermediate and valued components (ICs and VCs) are described. Overall, these changes to the EA resulting from construction updates can generally be summarised as follows: • Reductions in potential adverse changes or effects on ICs, biophysical VCs, social VCs, and Current Use; and • Increases in positive interactions with socio-economic VCs. These beneficial changes to ICs and VCs occur at the level of interactions or potential effects, and in most cases are slight changes, and thus do not affect the overall conclusions made in the EIS, including proposed mitigation,	**Project Construction Update (PCU; CEAR Document #1210)**

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	ITP location on TFN Industrial Lands. Asked if other deep sea locations were considered, including in river sites. Requested an analysis of an on-land temporary sand storage option in the EIS. Stated that TFN has significant concerns over the current proposed location of the Intermediate Transfer Pit (ITP) as it would significantly impact on crab habitat that is actively harvested.	Tsawwassen First Nation #1 01-Sep-2016, Letter	pipelines over without impacting the northern area. A number of Fraser River locations were considered as storage sites, but they did not have sufficient capacity. With the on-land storage option, dredgeate would have to be transported from the land ITP to the construction site, which would cause the issue of double handling and road traffic. A number of options analyses were done in 2011. There is a 1,000,000 m^3 shortfall for the river storage option. Explained that if new dredging equipment currently unavailable in Canada becomes available, it may be possible to reduce the number of years that the ITP would be required. Noted the VFPA is open to refining the Project to make it better and should the VFPA and Tsawwassen First Nation agree that the ITP isn't located in the right spot, the VFPA would be open to moving it. Noted that more detailed information will be available when the EIS is submitted; the VFPA anticipates all the information required for Tsawwassen First Nation to understand the proposed use of the site will be in the EIS. Tsawwassen First Nation will be provided with a copy of the EIS when it is submitted to the CEA Agency. The CEA Agency will also be seeking Tsawwassen First Nation's input. Stated that once Tsawwassen First Nation has had a chance to review the information in the EIS, if there are additional questions the VFPA will come back and guide Tsawwassen First Nation through the EIS. Noted that construction cannot occur at all times; there are closures and other construction activities to coordinate with. Speculated that potential delays associated with avoiding use of the ITP altogether, would be years. Explained the connection between the containment dike construction and the stockpile. Noted that a schedule analysis for the first year of construction was done. Noted that there is no long-term environmental impact and that the VFPA has done environmental studies. **05-May-2015, Meeting:** Provided background information on the ITP and why it was chosen. The ITP site is the same location and size as for DP3. When planning RBT2, assumed that the site would be used again, as located in an already disturbed area (turning basin). In river storage was ruled out due to insufficient capacity; storage on land was ruled out because of associated increases in truck traffic, and no viable location on land was identified. Confirmed that no other deep sea locations were considered in the analysis, because 1) wanted to avoid area north of the causeway, where eelgrass is located	residual effect characterisations, significance determinations or cumulative effects, as applicable, with one exception. The only component predicted to have a change to residual effects is land and water use, with a reduction of a residual effect on access to Tsawwassen First Nation community lease lands from a measurable non-significant residual effect to a negligible residual effect, due to elimination of the ITP and associated activities. **Additional information provided by the VFPA:** Outside of Project consultation meetings, representatives of the VFPA also met with Tsawwassen First Nation to discuss the ITP at its discussions surrounding the Memorandum of Agreement.	

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			and 2) constricted to areas where a pipeline could reach (2 km). Locations north of the causeway also had technical limitations particularly with sediment dispersion and scour, and economically they would be no different. In-river sites did not have enough capacity for the critical first year. Shared that this information can be found in EIS Section 5.0 (Alternative Means of Carrying out the Project). In most cases consider: 1) technical and economic feasibility and then 2) environmental VCs. **30-Sep-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Agency did not request additional information for this item as an on-land temporary sand storage option was not specifically required by the* EIS Guidelines*. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."* **09-Dec-2015, Letter from the VFPA:** Indicated that the VFPA is prepared to hold exploratory discussions with Tsawwassen First Nation regarding the potential for an agreement for the VFPA to provide dredgeate material to Tsawwassen First Nation for its use on Tsawwassen First Nation Industrial Lands or for other purposes. **29-Apr-2016, Meeting:** Indicated that storing sand for RBT2 on Tsawwassen First Nation land is not viable and the VFPA is not pursuing this option further. The VFPA is still looking at options to minimise use of the ITP for RBT2. The VFPA will keep Tsawwassen First Nation informed of progress. **19-Jul-2016, Workshop:** Stated that the VFPA is looking into alternatives to an ITP and would be giving updates on that in the next few months. **27-Jun-2017, Letter from the VFPA:** Stated that as a result of work undertaken over the past year to address concerns raised by Tsawwassen First Nation and other Indigenous groups related to Dungeness crabs and disposal at sea (DAS), and to reduce potential environmental effects from the Project, the VFPA has determined that the ITP is no longer required as a temporary storage location to support project construction. The elimination of the ITP, along with other changes will result in a Project that will not require a DAS permit.		

Table 3: Archaeological and Heritage Resources – Valued Component

#	Interest / Concern Raised	Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-3.1	Concerned about potential adverse effects on heritage and archaeological interests.	16-Oct-2013, Letter to the CEA Agency	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 28.0:** Physical and cultural heritage resources in the Roberts Bank area are described in EIS Sections 28.0 and 32.2. Fish trap stakes were identified as the only potential archaeological or heritage resource that has the potential to be affected by the Project construction or operation activities. No archaeological sites were identified in the LAA, either using the B.C. Archaeology Branch's online heritage registry or through the Archaeological Overview Assessment (AOA). If archaeological or historical materials remain in the intertidal area, it is likely that they have been preserved in the sediment layers, if not affected by previous construction. The Project may affect archaeological resources, namely fish trap stakes, if present in the Project area. Direct effects could result from Project-related construction activities, and indirect effects could result from changes to sediment deposition or erosion. As noted in EIS Section 28.0, through mitigation, including excavation of test trenches prior to construction activities and the implementation of an Archaeological Monitoring and Management Plan (see EIS Section 33.0), potential damage to archaeological resources would be avoided, and the opportunity for future archaeological study would be protected. Following mitigation, residual effects would remain, as there is still the potential for stakes to be exposed or crushed. However, the opportunity for future archaeological study would be protected through mitigation, and the assessment concludes these residual effects are not significant. The Project is not expected to result in significant residual adverse effects to archaeological and heritage resources. The Project is not expected to result in any incremental cumulative effects to archaeological and heritage resources. **Additional information provided by the VFPA:** The Construction Environmental Management Plan will include an Archaeological Monitoring and Management Plan, describing the procedures to be followed by the Infrastructure Developer in the event that an archaeological site is discovered during Project construction (also referred to as a 'chance find'). The plan will also describe the role and responsibilities of a professional archaeologist designated by the Infrastructure Developer to conduct archaeological monitoring, as needed. The Plan will be shared with Indigenous groups for review and comment prior to construction. **Addressed in response to IR10-24:** The VFPA's response to IR10-24, as requested by the Review Panel, discusses the proposed chance find procedure and aspects of the Archaeological Monitoring and Management Plan.	**EIS** 28.0 Archaeological and Heritage Resources 32.2 Current Use of Land and Resources for Traditional Purposes Assessment **Information Requests** Response to Sufficiency Information Request #24 (IR10-24)
TFN-3.2	Noted that there is a lack of sub-tidal archaeological work due to inaccessibility. Asked why the VFPA did not conduct underwater archaeological studies.	07-Feb-2014, Conversation – Comments on draft AOA	**06-May-2014, Letter from the VFPA:** *"Based on information from Millennia Research Limited, underwater surveys are not routinely undertaken in subtidal areas with low archaeological potential. However, an underwater archaeological survey was conducted as part of previous Deltaport expansion which included remote-sensing and inspection of subtidal targets (Arcas Consulting Archaeologists Ltd. 1996). The project did not identify any pre-contact or protected historical material and found there to be little potential for subtidal sites to exist in the vicinity of the development.* *The current RBT2 assessment of potential was additionally supported by pre-field data collection*		

Tsawwassen First Nation

#	Interest / Concern Raised	Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			through a number of intertidal geomorphology sources as well as LiDAR data used in conjunction with the preliminary field reconnaissance. *The geomorphology report cited in the draft AOA suggests that sedimentation along the foreslope is minimal (NHC Triton p177), meaning that it could provide conditions in which underwater archaeological features are visible. However, the subtidal areas have been assessed as low potential for expected site types. The vast majority of the subtidal zone within the project area is located on the delta foreslope which is composed of sloping mud and sand. Combined with the depth of the water, and the distance from shore, these factors create very unlikely conditions for reef netting stations, one of the only site types that might be expected to be observed during the underwater survey.* *Dropped or lost items, the other expected site type, would be obscured by even minimal sedimentation. The delta foreslope feature does not represent an area where early coastal sites would be submerged following sea level changes because it is not a submerged shoreline. It is a feature created underwater by sedimentation, some of which is related to the Fraser River sediment plume and is not present in the current form because the sea level was at maximum 12 meters less than it is today."*		
TFN-3.3	Asked why the Preliminary Field Reconnaissance was conducted along a 2 km stretch of the north side of the causeway, and not extended out to the terminal location.	07-Feb-2014, Conversation – Comments on draft AOA	**06-May-2014, Letter from the VFPA:** *"Millennia Research Limited determined that 2 km was a sufficient distance for the preliminary field reconnaissance, however the report has been revised to state that no incised channels or exposures were observed beyond 2 km from shore and the mudflats showed much less relief. As channels or exposures represent the only areas where fish trap remains could have been visible, the survey was ended.* *In addition, the pre-field data collection utilised a number of intertidal geomorphology sources as well as LiDAR data and was used in conjunction with the PFR to inform the assessment of archaeological potential. These geomorphology findings also guided the preliminary field reconnaissance methods and extent of the survey."* **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 28.0 on Archaeological and Heritage Resources.	**Addressed in EIS Appendix 7.2-B (#155):** Rationale for the spatial boundaries of the assessment of archaeological and heritage resources is included in EIS Section 28.0 and in the AOA that was conducted to support the EIS. The draft AOA was provided to Indigenous groups for review.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 28.0 Archaeological and Heritage Resources Appendix 28-A Roberts Bank Terminal 2 Technical Report: Archaeological Overview Assessment

Tsawwassen First Nation

#	Interest / Concern Raised	Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-3.4	Asked why the provincial archaeological potential model is not available for the Project area. Concerned with the use of professional judgement to assess the archaeological potential instead of a more evidentiary-based approach, particularly with respect to fish traps.	07-Feb-2014, Conversation – Comments on draft AOA	**06-May-2014, Letter from the VFPA:** *"In regards to the availability of the provincial archaeological potential model, the AOA (see EIS Appendix 28-A) has been revised to state:* *"While archaeological potential models for parts of BC are made available by the BC Archaeology Branch, to the best of our knowledge, no model has yet been completed for the Project area and surrounding lowlands."* *A direct evidentiary-based approach was not possible for fish traps specifically due to the lack of surface visibility, the inability to subsurface test at the level of study, and the difficulty for testing posed by the mud flats. Instead, the assessment of potential for fish trap remains was based on three factors (provided on page 15 of the AOA), and the archaeological potential is considered moderate. The inventory aspects discussed in AOA Sections 7.3.3 and 7.3.4 discuss possible methods of inventory and mitigation for fish traps and represent direct evidentiary-based testing for fish trap remains. The area with the greatest archaeological potential is the historic drainage channel."* **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 28.0 on Archaeological and Heritage Resources.	**Addressed in EIS Appendix 28-A, Section 5.0:** The assessment of archaeological resource potential in the study area is based on the findings of background research and the preliminary field reconnaissance. While archaeological potential models for parts of B.C. are made available by the B.C. Archaeology Branch, to the best of our knowledge no model has yet been completed for the Project area and surrounding lowlands. Therefore, professional judgement has been used to make an assessment of potential for the onshore, subtidal, and intertidal zones.	**EIS** 28.0 Archaeological and Heritage Resources Appendix 28-A Roberts Bank Terminal 2 Technical Report: Archaeological Overview Assessment
TFN-3.5	Requested to review and comment on any 'Chance Finds Procedure' that is developed for the Project area.	07-Feb-2014, Conversation – Comments on draft AOA	**06-May-2014, Letter from the VFPA:** *"The EIS will present the framework for environmental management to be implemented during the construction and operation phases to mitigate potential effects. This document will also include an annotated outline for each Environmental Management Plan. Details regarding a Chance Finds Procedure for the Project area during construction and operation phases will be outlined in the EIS."* **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 28.12 regarding monitoring and follow-up programs.	**Addressed in EIS Section 28.12:** A chance find procedure will be included in an Archaeological Monitoring and Management Plan, as outlined in the Construction Environmental Management Plans (see EIS Section 33.3) to appropriately manage any inadvertent discovery of cultural materials or artifacts. This stop-work procedure involves seeking professional archaeological advice when suspected cultural materials or artifacts are found during construction, and includes steps such as notifying regulators and Indigenous groups, assessing the find for significance, and determining mitigation strategies on a case-by-case basis. **Addressed in response to IR10-24:** The VFPA's response to IR10-24, as requested by the Review Panel, discusses the proposed chance find procedure and aspects of the Archaeological Monitoring and Management Plan.	**EIS** 28.0 Archaeological and Heritage Resources 28.12 Monitoring and Follow-up Programs Appendix 28-A Roberts Bank Terminal 2 Technical Report: Archaeological Overview Assessment **Information Requests** Response to Sufficiency Information Request #24 (IR10-24)
TFN-3.6	Criticised the 1991 Bouchard and Kennedy ethnographic study of Tsawwassen, as detailed in one of the TFN Traditional Use Studies reviewed for the RBT2	07-Feb-2014, Conversation - Comments on draft AOA	**06-May-2014, Letter from the VFPA:** *"Based on information from Millennia Research Limited, the VFPA understands that subsequent to completion of the report, Tsawwassen First Nation expressed concerns with the 1991 Bouchard and Kennedy ethnographic study. Recognising these concerns, some information provided in the Bouchard and Kennedy document remains*	**Addressed in EIS Appendix 28-A and EIS Section 3.2.1.1:** In 1991, Arcas conducted a large scale investigation at archaeological site DgRs-2 as part of upgrades to Highway 17 for the Ministry of Transportation and Highways (Arcas Consulting Archaeologists Ltd. 1991a). As part of the project, a detailed ethnographic study of the Tsawwassen Reserve was compiled by Bouchard and Kennedy (1991). The Tsawwassen First Nation does not endorse this publication, but it contains information of direct relevance to the current study, and so those parts are used. Most relevant to the current report are the descriptions of sturgeon fishing off the Tsawwassen Reserve. The	**EIS** 28.0 Archaeological and Heritage Resources Appendix 28-A Roberts Bank Terminal 2 Technical Report: Archaeological Overview Assessment

#	Interest / Concern Raised	Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Archaeological Overview Assessment. Stated that the VFPA should undertake more ethnological work to address the issues raised by TFN.		*relevant to the review of the current Project, most importantly, sturgeon fishing in the intertidal zone.* *The report text has been modified to state that Tsawwassen First Nation does not endorse this publication, and only descriptions of sturgeon fishing off the former Tsawwassen Reserve were used in the AOA."* **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 28.0 on Archaeological and Heritage Resources.	study describes how sturgeon were harvested in a variety of manners including in tidal traps or 'tqep', gaff hooked, netted and harpooned.	
TFN-3.7	Requested more detail on the methodology for archaeological monitoring.	29-Oct-2014, Aboriginal Group EIS Workshop #4	**29-Oct-2014, Workshop:** Noted that input into monitoring is welcome. It is anticipated that there would be an annual preliminary field reconnaissance where the area would be walked, looking for visual evidence of this type of feature coming through the area that has been eroded. Ideally this work would be carried out by an archaeologist and a team of assistants. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 28.0 on Archaeological and Heritage Resources.	**Addressed in EIS Sections 28.0 and 33.0:** The Archaeological Monitoring and Management Plan will describe the procedures to be followed by the Infrastructure Developer in the event that an archaeological site is discovered during Project construction (also referred to as a chance find). Guided by the federal Archaeological Heritage Policy Framework, the plan will also describe the role and responsibilities of a professional archaeologist designated by the Infrastructure Developer to conduct archaeological monitoring, as needed. Specific mapping of and construction-phase monitoring for the exposure of fish trap stakes (as discussed in EIS Section 28.0) will be undertaken. The plan will also indicate who will be contacted to attend onsite should a chance find discovery occur, and will stipulate that construction work in the vicinity of the find will cease until the site is evaluated by a professional archaeologist. The plan will also describe the protocols to be followed in communicating such a find to the VFPA, Parks Canada, the B.C. Archaeology Branch, Tsawwassen First Nation, and other Indigenous groups as necessary. To ensure their alignment with all required Project permits, any conditions of approvals, final designs, finalised construction or operation approaches, and site-specific considerations, the Project's Environment Management Plans are necessarily developed and finalised nearer to the start of the construction and operation phases.	**EIS** 28.0 Archaeological and Heritage Resources 28.7.2 Mitigation Measure #2 – Mitigation for Exposure of Potential Fish Trap Stakes 33.0 Environmental Management Program 33.3.4 Archaeological Monitoring and Management Plan

Table 4: Coastal Birds – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-4.1	Stated that migratory birds are very important to TFN for food, social, and ceremonial purposes. Stated that any impacts to migratory birds, their habitat, on TFN's opportunity to harvest migratory birds are of great concern to TFN.	16-Oct-2013, Letter to the CEA Agency	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 32.3.2.1:** EIS Section 32.3.2.1 concludes that the proposed project would not affect the ability of Tsawwassen First Nation to harvest migratory birds in the Tsawwassen First Nation Migratory Bird Harvest Area (EIS Figure 32.1). **Addressed in response to IR10-04:** The VFPA's response to IR10-04, as requested by the Review Panel, discusses potential Project effects on wildfowl harvesting opportunities.	**EIS** 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes 32.3.2.1 Potential Impacts on the Exercise of Treaty Rights – Tsawwassen First Nation **Information Requests** Response to Sufficiency Information Request #4 (IR10-04 of CEAR Document #1216)
TFN-4.2	Asked whether the VFPA has been checking the health of ducks and geese, which are part of the TFN diet, and whether there is potential for contamination of these birds due to coal.	18-Nov-2013, Community Meeting	**18-Nov-2013, Meeting:** Recorded comment for consideration by the Project team. **15-Jan-2014, Letter from the VFPA:** The VFPA has not looked at various duck species, and while it is unlikely that there would be contamination in the ducks, this will be considered in the scoping of the Human Health Risk Assessment, as part of the EA for the proposed Project. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#94):** The potential for contamination of coastal birds due to sediment re-suspension during Project construction is considered in the coastal birds' assessment in the EIS. Contamination is not anticipated as sediments that will be re-suspended and deposited as a result of construction-phase activities are not contaminated (based on characterisation of the existing environment).	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 9.0 Physical Setting 9.6 Surficial Geology and Marine Sediment 15.0 Coastal Birds 15.5.4 Waterfowl 15.7 Future Conditions with the Project
TFN-4.3	Concerned about bird strikes from power lines. Noted that the Vancouver Island Generation Project (VIGP) buried power lines as a result of power being knocked out frequently from heron strikes. Suggested this should be done for RBT2 regardless of the cost.	29-Oct-2014, Aboriginal Group EIS Workshop #4	**29-Oct-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#98):** No new overhead transmission lines are required for the Project. All new electrical and communications cables required for the Project will be distributed through the site via underground ducts and conduits, as described in the EIS. Consequently, effects on coastal birds related to collisions with power lines associated with the Project are not anticipated.	**EIS** 4.0 Project Description 4.4.1 Construction-phase Activities Appendix 7.2-B Aboriginal Groups Issues and Interests 15.0 Coastal Birds 15.5 Existing Conditions
TFN-4.4	Requested more information on the effects of stray light on animals and birds, as well as proposed light mitigation measures for this purpose.	18-Nov-2013, Community Meeting 29-Oct-2014, Aboriginal Group EIS Workshop #4	**18-Nov-2013, Meeting:** Committed to follow-up with Tsawwassen First Nation regarding whether or not light and wildlife impacts are being looked at. Noted that light nuisance is being looked at, but is unsure about wildlife. **15-Jan-2014, Letter from the VFPA:** The EA for the proposed Project includes an evaluation of illuminance levels (the amount of light striking an object) and sky brightness levels both under ambient conditions as based on anticipated changes resulting from the Project. Components will be studied under varying light conditions such as daytime,	**Addressed in EIS Appendix 7.2-B (#95):** It is recognised that nocturnal behaviour of birds varies in response to lighting conditions. A review of documented effects of both natural and artificial light on birds is provided in the EIS. The potential effects on coastal birds of changes in artificial light related to the Project are considered in the EIS. A Light Management Plan will be included in the Construction Environment Management Plan and the Operation Environmental Management Plan to reduce artificial light-related effects on coastal birds.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 15.0 Coastal Birds 15.7.2 Future Conditions with the Project, Potential Effect - Changes in Productivity 15.8.3 Mitigation #2 – Measures to Address Productivity Loss due to Changes in Habitat Quality 33.0 Environmental Management Program

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information

			night-time and various atmospheric conditions such as clear skies and overcast conditions.
			The Project is not anticipated to affect any terrestrial ecological receptors, such as wildlife. The Project area in the terrestrial environment is limited to approximately 1 ha area within the existing rail network on BCR right-of-way (the area proximal to the connection of the causeway tracks to the BCR tracks at the east of the causeway).
			11-Apr-2014, Email from the VFPA:
			Shared with Tsawwassen First Nation that 'visual resources' is identified as a VC for the Project.
			29-Oct-2014, Workshop:
			Presented information on the mitigation measures related to coastal birds, including:
			Avoidance Measures:
			• Project Placement and Design; and
			• Timing Windows (where practical).
			Mitigation Measures to address Productivity Losses:
			• Via Changes in Water Quality;
			• Construction Environmental Management Plan (EMP);
			• Surface Water Quality or Sediment Control Plan;
			• Operation Environmental Management Plan; and
			• Offsetting plan.
			Mitigation Measures to address Disturbance:
			• Via Underwater Noise;
			  ○ Bubble curtains;
			  ○ Construction "ramp-up" periods;
			• Via Aboveground Noise & Visual Disturbance;
			  ○ Construction "ramp-up" periods;
			• Via Artificial Lighting; and
			  ○ Valances to minimise light trespass.
			01-Apr-2015, Letter from the VFPA:
			Provided a copy of the EIS, which included EIS Section 15.0 on coastal birds.
				Addressed in response to IR-7.31.15-25:
				The VFPA's response to IR-7.31.15-25, as requested by the CEA Agency, presents describes the general behaviour of birds to natural and artificial illumination, as documented in existing literature sources. To provide context, it also summarises existing and predicted future illumination levels within the LAA, and provides some common light levels for comparison purposes. For each coastal bird sub-component (including waterfowl), the response provides a characterisation of the way existing artificial light and moon phase affect bird distributions at the Project site and discusses the potential added effects of Project lighting on bird distributions.
				Based on the review of existing literature and known waterfowl distribution patterns in the LAA and region, anticipated adverse effects to waterfowl from Project-associated lighting are predicted to be minor to negligible. If a species of waterfowl is affected by increased Project-associated illumination, relocation to a less illuminated portion of the LAA would be the most likely effect. Overall, effects to waterfowl productivity are not anticipated.
					33.3.5 Construction Environment Management Plan, Light Management Plan
					33.4.3 Operation Environment Management Plan, Light Management Plan
					Information Requests
					Response to Additional Information Request #25 (IR-7.31.15-25 of CEAR Document #314)
					Response to Sufficiency Information Request #4 (IR10-04 of CEAR Document #1216)

TFN-4.5	Stated that TFN disagrees with EIS findings that the Project will not impact TFN's ability to harvest migratory birds. Stated that the EIS does not provide any indication of the nature or extent of changes to the area available to TFN members to hunt for Migratory Birds. Requested (i) a map showing the current no-shooting zone and the likely postdevelopment no-shooting zone, (ii) a numerical	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR10-04:** The VFPA's response to IR10-04, as requested by the Review Panel, discusses potential Project effects on wildfowl harvesting opportunities.	**Information Requests** Response to Sufficiency Information Request #4 (IR10-04 of CEAR Document #1216)

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	summary of the current and post-development areal footprints of the no-shooting areas, and (iii) an assessment of the potential effects on the Treaty right to harvest migratory birds. Stated that over the years, there has been an incremental loss of migratory bird hunting opportunity for Tsawwassen First Nation citizens. This development is expected to further contribute (cumulatively) to this loss. Stated that the current port and causeway are within a zone in which the discharge of firearms is prohibited (see http://www.env.gov.bc.ca/fw/wildlife/hunting/regulations/docs/FVSAH2015.pdf). Stated that they assume that the proposed expansion of the port and causeway will necessitate an expansion of the zone in question.				

Table 5: Coastal Geomorphology – Intermediate Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-5.1	Asked about the impacts from wave action caused by ship wake to the shoreline, including cumulative effects from increased traffic from other proposed projects.	27-Nov-2013, Community Meeting	**27-Nov-2013, Meeting:** Confirmed that wave action from ship wake is measurable but negligible. **15-Jan-2014, Letter from the VFPA:** *"The importance of changes to existing processes and the physical environment for the ecosystem were identified through the Coastal Geomorphology Technical Advisory Group (TAG). Coastal geomorphological processes that shape and modify the environment including wind, waves, currents, and freshwater and sediment inputs will be described based on a combination of field studies, interpretative geomorphic studies, empirical calculations, and numerical modelling.* *Study outcomes will provide a comprehensive understanding of the natural rates of change on the tidal flats and delta foreslope. The predicted changes in tidal flows and patterns, tidal channels, and sediment deposition and erosion, plus anticipated scour induced by modified waves and tidal currents, and the formation of a wave shadow over the part of the tidal flats will be considered in the assessment of effects on marine biological VCs."* **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#53):** The EIS considers the potential interactions between predicted Project-related changes to coastal geomorphology and similar changes potentially resulting from other projects and activities, including ship traffic, as described in the EIS. The EIS describes the general wave climate and potential changes to wave action at Roberts Bank as a result of the terminal. A detailed analysis of potential changes to geomorphology at Roberts Bank from ship wake was not conducted as the number and size of waves generated by the additional shipping in the area was anticipated to be very small relative to the overall wind-induced wave climate in the area. **Addressed in MSA Section 9.4:** All potential incremental effects on archaeological and heritage resources related to Project-associated vessel transit activities, including shoreline erosion from vessel wake, were determined to be negligible, as wake waves predicted from Project-associated marine vessel traffic are predicted to be within the range of natural conditions. **Addressed in response to IR7-21:** As noted in the VFPA's response to IR7-21, as requested by the Review Panel, although the probability slightly increases from Project-associated vessels (0.034% during calm conditions), wake-generated waves from Project-associated vessels will not result in a change to the shorelines in the marine shipping area due to the similarity of interaction at the shoreline from wake-generated and wind-generated waves.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 9.5 Coastal Geomorphology 9.5.9 Future Conditions with the Project and Other Certain and Reasonably Foreseeable Projects and Activities Appendix 9.5-B Rationale for Exclusion of Other Certain and Reasonably Foreseeable Projects in the Cumulative Change Assessment of Coastal Geomorphology **MSA** 9.4 Archaeological and Heritage Resources **Information Requests** Response to Sufficiency Information Request #21 (IR7-21 of CEAR Document #1141)
TFN-5.2	Interested in the VFPA returning with experts who can speak to anticipated changes to hydrological and geomorphological conditions in the vicinity of RBT2. Concerned that the Project will affect the substrate and that it will change the nature of the interaction between the mouth of the Fraser River and the Salish Sea and potentially impact the navigability of the area for people. Asked whether this had been addressed in the EIS, and if so, that additional information and explanation be provided for clarification.	22-Jan-2016, Meeting 19-Jul-2016, Issues Workshop – Musqueam First Nation / Tsawwassen First Nation #1 12-Sep-2016, Issues Workshop - Musqueam First Nation / Tsawwassen First Nation #2	**22-Jan-2016, Meeting:** Recorded comment for follow-up. **03-Feb-2016, Email:** Reiterated the VFPA's commitment to meet with Tsawwassen First Nation and their consultant to review sections of the EIS of interest and noted availability to do so at Tsawwassen First Nation's request. **12-April-2016, Meeting:** The VFPA and Tsawwassen First Nation discussed this commitment and Tsawwassen First Nation noted internal staffing changes had delayed their ability to schedule such meetings. The VFPA and Tsawwassen First Nation agreed to a series of presentations, to be held at a later date on topics of Tsawwassen First Nation's choosing, with Tsawwassen First Nation to provide preferred format and list of topics to the VFPA. **19-Jul-2016, Workshop:** Committed to schedule the next workshop on the topics of coastal geomorphology. **12-Sep-2016, Workshop:** Included the topic of coastal geomorphology and a coastal geomorphologist was in attendance to provide explanation and clarification as well as to respond to questions and concerns.	**Addressed in EIS Appendix 7.2-B (#49):** Field studies, air photo review, and modelling of sediment deposition at Roberts Bank (including Canoe Passage) were undertaken during the Project assessment, as described in the EIS. A Canoe Passage discharge channel location and sediment distribution (e.g., bar formation or buildup of sand) were modelled to assess variation pre- and post-terminal construction. Potential changes associated with the configuration of RBT2 were assessed in relation to Roberts Bank, including the Canoe Passage discharge channel. Project-related changes to coastal geomorphological processes on Roberts Bank are predicted to be associated with the terminal footprint. However, the Project is not anticipated to alter sediment dynamics or water movement in and around the mouth of the Fraser River. Changes are anticipated around the terminal and within the intertidal zone shoreward of the terminal. The effects of these changes on VCs are considered in the EIS. **Addressed in EIS Section 9.5:** Changes to coastal geomorphology are not expected from terminal development activities, but are related to the terminal footprint itself. The footprint will interact with tidal currents and wind-generated waves resulting in alterations to sediment transport, sediment erosion and deposition, and water flow exchange in the construction and operation phases. During causeway construction, drainage channels are expected to form on the tidal flats adjacent to the causeway. This change will occur	**EIS** 9.5 Coastal Geomorphology 9.5.6 Existing Conditions 9.5.8 Future Conditions with the Project Table 9.5-6 Predicted Morphological Changes from the Project Footprint Figure 9.5-35 Approximate Spatial Extent of Potential Changes Associated with the Project Footprint **Information Requests** Information Request Package 2 from the Review Panel for the RBT2 Project EA: Package 2 Preamble

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Asked whether the Project footprint will have an impact on the way other other natural processes (e.g. storms) affect the geomorphology of the Canoe Passage area (i.e. make it more stable/predictable or more dynamic/changing). Noted that TFN elders and fishers understand the system to have been dynamic for a very long time and are now less certain about its changes. Concerned that the Project will result in geomorphological changes that will adversely affect navigability in the vicinity of Canoe Passage.		Noted that the understanding reached through the assessment is that the effect of the Project doesn't extend as far as Canoe Passage.	during construction only, and will be temporary and reversible. The VFPA will ensure the study and management of potential channel formation related to drainage of tidal waters through the causeway dyke during the construction phase. Changes will be incorporated in detail design, as required. Changes from the expansion of the tug basin include the conversion of local tidal flats to subtidal waters. Although the formation of additional tidal channels is not anticipated, a small increase in the size of an existing channel is likely. No incremental cumulative changes in coastal geomorphology are anticipated to result from the Project in combination with other projects and activities. **Addressed in EIS Appendix 7.2-B (#50):** Changes in hydrology are predicted to affect salinity and turbidity levels, and increase sediment deposition as a result of the Project, but these changes are anticipated to be minimal relative to existing natural variability. These localised indirect effects of changes in hydrology on habitat are evaluated in the marine biophysical component effects assessments, including marine vegetation, marine invertebrates, marine fish, and coastal birds. **Addressed in response to Information Request Package 2 Preamble:** As noted in Package 2 Preamble, one of the simplifying assumptions that was incorporated into the sediment transport modelling reported in the EIS is that tidal currents, not waves, are the dominant process driving bed level changes in the local study area (LSA). This conclusion was supported by field data and historical analysis of bed levels which have shown that bed levels in the LSA have remained relatively stable for a 40 year period based on available records (1967 to 2011), despite the occurrence of a number of large storm events during this time period. This analysis of measured long-term bed level changes reinforces the validity of the numerical model outputs that rely on tidal currents, not waves, as the dominant factor driving sediment transport in the LSA. This is reflected in one of the key findings of the coastal geomorphology study that the main changes to sediment transport are localised to the area around the RBT2 terminal footprint, a consequence of the terminal siting in deep water. A 1 in 100-year simulated northwest storm event was modelled to understand the effect of an extreme storm on a) sediment transport, and b) bed level changes (morphodynamics) in the intertidal area of Roberts Bank. Sensitivity analyses on sediment grain size and the sediment transport equation were also performed. The study concluded that the Project will not magnify the effects of waves during a large storm event and the specified model grain size is consistent with the geomorphic understanding of the Roberts Bank system, which has evolved to its present form in response to long-term processes that include periodic large storm events.	
TFN-5.3	Asked why venting under the causeway to generate more flow into and out of the inter-causeway area is not being pursued.	08-Oct-2014, Preliminary EIS Workshop #2	**08-Oct-2014, Workshop:** The concept of breaching or venting has been looked at several times by hydrologists. For DP3 breaching the causeway was considered, and for RBT2 breaching the area that would connect the existing Westshore Terminals to the new facility was again	**Additional information provided by the VFPA:** An independent technical study, "Potential Effects of Opening the Causeway," was undertaken for the Vancouver Port Authority in 2005 to clarify issues related to physical processes and hydraulic behaviour in the inter-causeway area of Roberts Bank. This report determined	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Asked why the design of the causeway does not include culverts to reduce pressure and request for a more detailed explanation.	26-Nov-2014, Health & Aboriginal Rights Workshop – Tsawwassen First Nation 05-May-2015, Meeting	considered. Various sizes were considered up to 30m, which is the largest opening possible without having to put in piers. There were two resulting problems, one being that the flows would be so turbulent that any fish going through the opening would be beaten to death, and the second being that it would result in the formation of dendritic channels, which the VFPA is trying to avoid. **26-Nov-2014, Workshop:** Stated that the coastal geomorphologist who presented at workshop #2 (08-Oct-2014) provided an answer to that question. Committed to follow up and provide it to Tsawwassen First Nation. **05-May-2015, Meeting:** Explained that dendritic channels were an issue (for DP3), and there is concern that venting the causeway would exacerbate this issue. Inserting a 30 m gap between the pods for water to flow was also considered. Modelling showed that the velocity would kill fish and destroy the artificial reefs on the existing pod. It was explained that the VFPA has been studying dendritic channels as part of the adaptive management strategy for existing terminal, and these channels cause the loss of highly productive eelgrass habitat. Committed to provide Tsawwassen First Nation with the answer to this question from EIS Appendix 7.2-B, including the link to a memo on this subject. **06-May-2015, Email from the VFPA:** Followed up with more information on the effects of incorporating culverts into the causeway design. In EIS Appendix 7.2-B, comment ID #3 addresses your question and also provides a link to a memo written by Northwest Hydraulic Consultants on the topic: *"The extent of widening along the causeway is determined by road and rail infrastructure requirements for the Project. To minimise the marine footprint, widening will vary from 0 m to approximately 140 m.* *Past experience at Roberts Bank has indicated that the tidal flats are sensitive to disturbance. In particular, past development has resulted in localised development and expansion of tidal channels and associated changes in the degree of influence of the Fraser River outflow plume on the inter-causeway area.* *During Project design, the addition of a flow passage channel (i.e. an opening) between the existing Westshore Terminals and the Project was evaluated to determine if the volume of water that would otherwise flow around the northwest corner could be reduced. It was determined that a 100-m-wide flow passage would slightly reduce flow velocities at the northwest corner, but it would generate additional local scour in the passage itself and adjacent areas unless other mitigation measures were installed. An independent technical study, "Potential Effects of Opening the Causeway," was undertaken for the Vancouver Port Authority in 2005 to clarify issues related to physical processes*	that there is a substantial risk that a new opening in the causeway could initiate a new sequence of morphological changes on the tidal flats, which could adversely affect the existing habitat conditions. Furthermore, the assessed opening would be expected to have only a minimal contribution to flushing flows in the inter-causeway area. The report is available on the Project website: http://www.robertsbankterminal2.com/wp-content/uploads/RBT2-Potential-Effects-of-Opening-the-Causeway-June-2005-NHC-Memo-January-2014.pdf. Based on the findings of this report, and the evaluation of adding a flow passage channel, the VFPA does not propose to open the Roberts Bank causeway. Further information concerning this study is available as IR1-13. **Addressed in response to IR1-13:** The potential effects of opening the causeway were further discussed in the VFPA's response to IR1-13. During DP3, the VFPA, regulators, and Indigenous groups discussed the potential for opening the causeway by installing a culvert. Such a breach in the causeway was considered to allow flow exchange (i.e., to measurably change the salinity or delivery of sediment) to the inter-causeway area. Results of calculations and analyses are summarised in the technical noted above. The results showed that a culvert would not pass sufficient Fraser River flow to measurably change the salinity or delivery of sediment to the inter-causeway area.	**Information Requests** Response to Sufficiency Information Request #13 (IR1-13 of CEAR Document #897) **2005 Memorandum Concerning Potential Effects of Opening the Roberts Bank Causeway:** http://www.robertsbankterminal2.com/wp-content/uploads/RBT2-Potential-Effects-of-Opening-the-Causeway-June-2005-NHC-Memo-January-2014.pdf

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			and hydraulic behaviour in the causeway area of Roberts Bank. This report determined that there is a substantial risk that a new opening in the causeway could initiate a new sequence of morphological changes on the tidal flats, which could adversely affect the existing habitat conditions. *The report is available on the Project website: http://www.robertsbankterminal2.com/wp-content/uploads/RBT2-Potential-Effects-of-Opening-the-Causeway-June-2005-NHC-Memo-January-2014.pdf.* *Based on the findings of this report, and the evaluation of adding a flow passage channel, [the VFPA] does not propose to open the Roberts Bank causeway."*		
TFN-5.4	Asked whether sea level change and the resulting effects to coastal geomorphology will be considered in the EIS, including a study by Phillip Hill.	27-May-2014, Technical Working Group Meeting #3 08-Oct-2014, Preliminary EIS Workshop #2	**27-May-2014, Working Group:** Stated that the Dr. Philip Hill study is considered in the Coastal Geomorphology section of the EIS and in the associated modelling. It has been taken into account in terms of engineering and design, including in the determination of terminal elevation. Dr. Philip Hill was a member of one of the TAGs for the Project. **08-Oct-2014, Workshop:** Stated that for the Coastal Geomorphology section, effort was made to quantify what the expected changes to sea level rise would be, noting there are widely varying estimates [as to the eventual increase in sea levels]. An estimate was chosen that is in alignment with the provincial flood standards, and how sea level rise will affect wave environment was quantified. The other studies will take that information and move forward with it. There is also a summary chapter required by the *EIS Guidelines* that asks the VFPA to assess the effects of the environment on the Project, and what the subsequent effects of the Project are on the environment. This separate summary chapter provides an assessment of tsunamis, earthquakes, sea level rise, strong winds, and storm events, but individual sections will look at environmental effects as well, as this section has considered sea level rise. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 9.5 on coastal geomorphology and Section 31.0 on the effects of the environment on the Project.	**Addressed in EIS Section 9.5.7.2:** As noted in EIS Section 9.5.7.2, coastal geomorphology is expected to change, even without the Project, because of existing processes as well as from changes in processes brought about by climate change. As a result, sea level change is a factor in the geomorphology assessment presented in EIS Section 9.5. **Addressed in EIS Section 31.2.6.1:** Effects due to future sea level rise are not considered relevant to the Project's construction phase as these activities will be completed in the early 2020s. During Project operation, sea level rise may amplify the effects of rainfall, wind, waves, and tidal action in the vicinity of the Project. These potential effects may result in an increase in erosive forces on marine structures and surfaces, as well as increased stormwater runoff. Since, as previously described, these potential effects will be addressed in Project design, they are not expected to interfere with Project operation. Over the long-term (i.e., 50 to 100 years), sea level rise is, however, expected to have adverse consequences for intertidal habitat throughout the Fraser River delta, including Roberts Bank. The presence of dykes will constrain the natural process of shoreline migration, resulting in a narrowing of the intertidal zone and a gradual decrease in the areal extent and productivity of the mudflat (Hill et al. 2013). In the Project area, intertidal habitat to be established on the north side of the causeway to mitigate Project effects on productivity and habitat loss will be gradually inundated, progressively altering the intended purpose of this habitat from intertidal to subtidal habitat. This gradual conversion to subtidal habitat is not unique to the area of habitat creation on the north side of the causeway -- it will also occur at other intertidal locations within the Fraser River estuary and along the coast. As described in EIS Section 4.2.1, the Project's preliminary design provides for a net sea level rise of 0.5 m which takes into account the projected 1.0 m sea level rise adopted by the Province of B.C. (Ausenco-Sandwell 2011), while accounting for the drop in sea level in the area associated with settlement (0.5 m) that is anticipated to occur within the same timeframe (see Appendix 4-A Basis of Design). Since the overall net change in sea level will be gradual, it is not expected to affect Project construction or operation.	**EIS** 4.0 Project Description 4.2.1 Marine Terminal 9.5 Coastal Geomorphology 9.5.7.2 Operation Phase 31.0 Effects of the Environment on the Project 31.2.6.1 Sea Level Rise

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				Due to constraints imposed by the presence of dyke structures, as sea levels rise and intertidal habitat is converted to subtidal habitat, it will not be possible to prevent or mitigate the gradual change of intertidal habitat and colonisation of subtidal-associated species (i.e., those species that are tolerant of greater water depth and longer periods of inundation).	
TFN-5.5	Asked how confident the VFPA is in its assessment predictions [for coastal geomorphology]. Noted that for DP3 similar work was done, some assumptions were made, and mitigation measures for some disciplines were informed by that work.	12-Sep-2016, Issues Workshop – Musqueam First Nation / Tsawwassen First Nation #2	**12-Sep-2016, Workshop:** Responded that no one can be 100%, but that the VFPA is very confident. The Project team went through a process to design the study, going back to when the TAG met three times with experts in coastal geomorphology, geology, oceanography; the study plans were shared with the TAG for critique. The TAG had some great suggestions which were adopted. The study isn't perfect, but the Project team feels that if a different group were given a similar opportunity to conduct this kind of study a similar answer would be reached. As to what was done with the results of the study, the VFPA referenced hundreds of hours spent with other discipline leads to explain, discuss and answer questions about the coastal geomorphology study to help interpret its data. Each of the other disciplines' studies identify where their uncertainties are. The VFPA noted confidence that the results of the study were properly understood by the other disciplines and integrated into the ecological components of the assessment.	**Addressed in EIS Appendix 7.2-B (#32):** The VFPA is committed to developing and implementing a Follow-up Program for the Project. The purpose of the Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project. To ensure the Program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the EIS. The Follow-Up Program will be developed in consultation with federal agencies, including the CEA Agency, Fisheries and Oceans Canada (DFO), and Environment Canada. Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on the program and approving agencies have an opportunity to evaluate and approve the Program. Feedback from Indigenous groups regarding the draft Program will be sought through the VFPA's ongoing engagement initiatives.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 33.0 Environmental Management Program

Table 6: Economic Development – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-6.1	Asked why container trade numbers are increasing, and if it is due to worldwide population growth or a change in market. Asked if Canada Free Trade agreements have an impact on an increase in numbers.	27-Nov-2013, Community Meeting	**27-Nov-2013, Meeting:** Recorded comment for follow-up. **15-Jan-2014, Letter from the VFPA:** *"In 2012, almost 3.3 million twenty-foot equivalent units (TEU) moved through terminals on the Canadian west coast, of which 2.7 million TEUs moved through terminals within the VFPA's jurisdiction. Annual third-party forecasts (Ocean Shipping Consultants, July 2013) show that container traffic through Canada's west coast is expected to grow to a high of 9.75 million TEUs by 2030. http://www.robertsbankterminal2.com/information-centre/project-documents/"*	**Addressed in response to IR1-03:** Appendix IR1-03-A of IR1-03 provides the most recent Container Traffic Forecast Study – Port of Vancouver, 2016 by Ocean Shipping Consultants. **Additional information provided by the VFPA:** Global trade was transformed in the 1950s by the efficiencies created by the introduction of standardised shipping containers. As a result of this worldwide shift to shipping a wide variety of goods in this manner, a steadily growing volume of Canada's international trade moves through the Port of Vancouver in containers each year. Importers and exporters prefer moving their goods in containers because they: • Can carry almost any type of cargo safely and securely around the world • Have a standardised design and are sturdy and reusable • Can be easily moved between different modes of transportation including truck, train, and ship • Enable exporters to protect and provide high-quality goods, as containers reduce the risk of damage and contamination, and can be temperature controlled • Provide cost-effective access to customers all over the world Overall container volumes have grown at a significantly greater pace than overall economic growth within Canada, and greater than even international trade growth itself. Between 1995 and 2000, the average annual growth of containers through west coast ports was 142,000 TEUs (about 19% annually). Since 2012, average growth has risen to about 180,000 TEUs (about five% annually). Though the rate of growth is lower, it reflects a much larger increase in the actual number of containers moved through the port.	**EIS** 2.0 Project Overview 2.1 Project Purpose and Objectives 2.1.1 Rationale **Information Requests** Response to Sufficiency Information Request #3 (IR1-03 of CEAR Document #897)
TFN-6.2	Concerned with potential impacts to the cost and availability of construction aggregate. Asked how the Project will impact the price of sand. Stated that TFN is already impacted by the price of sand in the Lower Mainland right now.	29-Oct-2014, Aboriginal Group EIS Workshop #4 05-May-2015, Meeting	**29-Oct-2014, Workshop:** Stated that there is detailed information in the economic development chapter on aggregates. Stated that work was done to understand the anticipated aggregate demand and sourcing. The preliminary effects assessment shows that there will be aggregate available, and the Project should not result in a supply-demand shortage scenario. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 20.0 on economic development. **05-May-2015, Meeting:** Recorded comment for consideration by the Project team.	**Addressed in EIS Table 20-6:** EIS Section 20.0 considers a potential change in availability or price of construction aggregate, including increased demand for construction aggregate in LAA due to Project and associated increased production due to Project. The assessment determined there would be a negligible effect on sand availability and prices in the LAA. There is available supply through increased variable cost production in the LAA and within other LAA aggregate supply sources in order to respond to higher but temporary requirements in the LAA aggregate market due to Project demand. No new quarries would be developed due to the Project. **Addressed in PCU:** With the updated construction activities, the overall demand for aggregate is expected to decline from that outlined in the EIS from 17.0 M m^3 to 16.9 M m^3 (a decrease of 0.1 M m^3), sand supply is expected to increase by 0.6 M m^3 from 12.4 M m^3 to 13.0 M m^3 (reflected in PCU Tables 2-2 and 2-3). The amount of fill material sourced from existing quarries will increase by 2.5 M m^3 to 3.6 M m^3 as the volume of sand available from Fraser River annual maintenance dredging will be reduced by 2.0 M m^3 (as reflected in PCU Table 2-3). As indicated in PCU Section 2.1, existing quarries have indicated they have sufficient capacity to meet Project needs and, as a result, the commissioning of a new quarry will not be required to support Project construction. As there is adequate local supply for sand, the increased requirement for sand identified in the PCU will not change EIS results, which indicate Project demand for sand would have a negligible effect on sand availability and prices in the LAA (EIS Section 20.6.1).	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 20.0 Economic Development 20.6.1 Rationale for Negligible Effect – Change in Construction Aggregate Availability and Price Table 20-6 Identification of Potential Project Interactions with Economic Development for Construction Phase **PCU**

Table 7: Effects Assessment Methods (including Cumulative Effects)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-7.1	Concerned with cumulative effects on marine use and seafood productivity. Noted that TFN would like the RBT2 socio-economic / community assessment to acknowledge the need for additional cumulative effects assessment on these topics. Requested a cumulative effects study. Noted that there are 5 or 6 projects occurring in TFN's fishing area and they are concerned about cumulative impacts. Expressed concern that the environmental assessment process will not appropriately characterize cumulative effects that are reflective of TFN's experience.	12-Jul-2013, Meeting 16-Oct-2013, Letter to the CEA Agency 13-Dec-2013, Email	**12-Jul-2013, Meeting:** Requested that Tsawwassen First Nation put the cumulative effects study request in writing. **15-Dec-2013, Email:** Responded and requested a meeting to discuss concern. **21-Jan-2014, Letter from the VFPA:** *"Cumulative effects will be examined in the event that there are adverse residual effects, as part of the structured EA process. In this case, the Project will look at the context of overall cumulative effects in the region.* *If Tsawwassen First Nation is undertaking a separate study, [the VFPA] would like to incorporate that information into the RBT2 EIS."*	**Additional information provided by the VFPA:** As described in the EIS, a cumulative effects assessment was conducted for the following socio-economic VCs: Marine Commercial Use, Visual Resources, Land and Water Use, Human Health, and Archaeological and Heritage Resources. A cumulative effects assessment was not conducted on Labour Market, Economic Development, Local Government Finances, Services and Infrastructure, Outdoor Recreation as no measurable adverse residual effects were predicted on these VCs. Cumulative effects are considered for each Indigenous group in EIS Section 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes. **Addressed in response to AIR-12.04.15-13:** In the EIS, the existing conditions (baseline) reflect the conditions of the environment as modified by past development. Further discussion of how the VFPA considered the effects of past, present and future projects is provided in the VFPA's response to AIR-12.04.15-13, including in that response's Schedules focused on applicable VCs. Specifically, Schedule 13-3 describes effects of past projects and activities on fish and fish habitat. For a broader perspective, the coastal marine environment (i.e., coastal geomorphology, marine sediment, marine water quality, tidal flat morphology, biosedimentological zones) is discussed in Appendix AIR13-A.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 8.0 Effects Assessment Methods 8.1.9 Cumulative Effects Assessment **Information Requests** Response to Additional Information Request #13 (AIR-12.04.15-13 of CEAR Document #388)
TFN-7.2	Suggested that the VFPA consider data from the Cohen inquiry, which provides data spanning back to the 1920s. Asked about the assessments conducted for past Roberts Bank development and what sort of changes have been observed over the subsequent 30 to 40 years.	19-Nov-2013, Meeting 28-Oct-2014, Preliminary EIS Workshop #3 14-Apr-2014, Community Meeting	**19-Nov-2013, Meeting:** Expanded on the data collection process and how published data on communities and federal and provincial data is used as a starting point. Acknowledged that it is limited to certain indicators. **28-Oct-2014, Workshop:** Responded that considerable volumes of existing literature was reviewed to characterise existing conditions. **14-Apr-2014, Meeting:** Explained that several environmental components will have changed over time and that studies used in the development of the EIS considers these changes.	**Addressed in EIS Section 32.0:** Cohen inquiry data is referenced in EIS Section 32.0. The VFPA publishes annual monitoring reports on the Adaptive Management Strategy for DP3, which are available on the VFPA website: http://www.portvancouver.com/development-and-permits/status-of-applications/deltaport-third-berth-project/. The Cohen Commission Final Report was an information source for EIS Section 13.0. Where applicable, the Report's information is used and referenced. **Addressed in response to AIR-12.04.15-13:** In the EIS, the existing conditions (baseline) reflect the conditions of the environment as modified by past development. Further discussion of how the VFPA considered the effects of past, present and future projects is provided in the VFPA's response to AIR-12.04.15-13, including in that response's Schedules focused on applicable VCs. Specifically, Schedule 13-3 describes effects of past projects and activities on fish and fish habitat. For a broader perspective, the coastal marine environment (i.e., coastal geomorphology, marine sediment, marine water quality, tidal flat morphology, biosedimentological zones) is discussed in Appendix AIR13-A.	**EIS** 13.0 Marine Fish 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes **Information Requests** Response to Additional Information Request #13 (AIR-12.04.15-13 of CEAR Document #388)
TFN-7.3	Concerned with the capacity for different organisms to deal with effects. Suggested that at some point a threshold will be reached, particularly with respect to the SRKW. Asked whose responsibility it is to say that there is a	27-May-2014, Technical Working Group Meeting #3	**27-May-2014, Working Group:** Stated that the EIS describes the effect and provides the context in which that effect is occurring. In addition, the EIS will include a defined threshold of significance for each VC. Where possible, thresholds that have already been defined are used. However, if a threshold has not been defined, the scientific experts will define a threshold	**Addressed in EIS Section 8.1.8:** To determine the significance of residual adverse effects, the assessment considered the nature of each residual effect and the context within which it is expected to occur. The existing (or expected) condition of each VC was compared with the future conditions predicted to result from the Project. The anticipated future condition of each VC with the Project was compared to a threshold of significance defined for that specific VC. The threshold of significance is the point beyond which the integrity of the VC may be compromised and the residual effect is considered to be significant. If the future	**EIS** 8.0 Effects Assessment Methods 8.1.8 Determination of Significance of Residual Adverse Effects ***Updated Guidelines for the Preparation of an Environmental Impact Statement (EIS***

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	certain level of impact that a resource can sustain [i.e., determine thresholds?].		of significance. Ultimately, the decision about the significance is made by the regulatory agencies. A representative from the CEA Agency stated: The person to determine the likelihood of a significant adverse effect is the Minister of Environment. The proponent can suggest what the significant environmental effect would be. Significance will be determined for Project-related effects as well as for the cumulative effects. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 8.1.8.	condition of the VC with the Project does not exceed the defined threshold, the effect is considered to be not significant. If the future condition of the VC with the Project does exceed the defined threshold, the effect is considered to be significant. When defining the threshold of significance, the assessment included consideration of existing standards, guidelines, or objectives that have been established by government through regulation or applicable regional land and resource use management plans or other mechanisms, where available and suitable for determining significance. If no appropriate government-established threshold was available, the significance threshold was defined using the professional judgement of the Project team and current scientific knowledge about the VC. The rationale for the significance threshold used in the assessment and for the determination of significance is provided for each VC. **Additional information provided by the VFPA:** The *Updated EIS Guidelines* as issued by the CEA Agency directs the proponent (the VFPA) to provide sufficient data and analysis on any potential changes to the environment to permit a thorough evaluation of the environmental effects of the project by a Review Panel. The Review Panel is currently undertaking an assessment of the environmental effects of the project in a manner consistent with the requirements of *CEAA, 2012* and the Final Terms of Reference (CEAR Document #176). The Review Panel will prepare and submit a report to the federal environment Minister, who will in turn make a determination of the significance of potential environmental effects. If the Minister decides that the Project is likely to cause significant adverse environmental effects, the Minister must refer to the Governor-in-Council the matter of whether those effects are justified in the circumstances and the decision of whether the Project should be approved.	***Guidelines*; CEAR Document #177)**
TFN-7.4	Stated that TFN believes mitigation is necessary even where no effect is predicted.	26-Nov-2014, Health & Aboriginal Rights Workshop – Tsawwassen First Nation	**26-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#29):** As described in the EIS, the assessment process considered the effectiveness of mitigation measures to be used to avoid, reduce, offset or otherwise mitigate each potential adverse Project-related effect. A determination of significance was undertaken only for the adverse effects that are expected to persist after the implementation of mitigation measures (i.e., residual effects). Therefore, mitigation is applied before the determination of significance.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 8.0 Effects Assessment Methods 8.1.3 Establishment of Assessment Boundaries
TFN-7.5	Asked about study timelines: • The timeline for baseline studies; • The rationale and methodology used in determining the timing of studies; and • How the timing of field studies potentially influences the results of the studies. Criticised that the CEA Agency approach uses current measurements as a baseline, and as a result, the assessment is incremental and consistently results in a determination of no cumulative effect.	27-Nov-2013, Community Meeting 07-Feb-2014, Phone call 26-Nov-2014, Health & Aboriginal Rights Workshop - Tsawwassen First Nation	**27-Nov-2013, Meeting:** Explained that baseline studies are currently underway and the VFPA will be looking at the results and impacts within the next year. **07-Feb-2014, Phone call:** Recorded comment for follow-up. **15-Jan-2014, Letter from the VFPA:** *"As part of ongoing environmental and technical work for the proposed Project, the VFPA is conducting field studies at Roberts Bank and the surrounding areas. The studies are part of the early planning phase focused on collecting baseline inventory information to help identify water and sediment quality, biofilm, marine fish, marine vegetation, marine invertebrates, coastal seabirds, coastal geomorphology, marine mammals and terrestrial wildlife aspects that may be affected by the potential projects. The VFPA will be looking at the results and impacts within the next year.*	**Additional information provided by the VFPA:** In 2012, the VFPA initiated field, desktop (i.e., literature review), and modelling studies to inform the understanding of existing conditions at Roberts Bank. Building on available information, these studies were designed to address known data gaps, as well as issues and interests of Indigenous groups, stakeholders and the public, as well as to provide baseline information to assess Project-related effects as part of the EA. Some Technical Data Reports are appendices to EIS sections, while others are available publicly on the RBT2 website: http://www.robertsbankterminal2.com/environmental-assessment/technical-data-reports/. **Addressed in response to AIR-12.04.15-13:** In the EIS, the existing conditions (at around the time of EIS writing) (baseline) reflect the conditions of the environment as modified by past development. Further discussion of how the VFPA considered the effects of past, present and future projects is provided in the VFPA's response to AIR-12.04.15-13, including in that responses' Schedules focused on applicable VCs.	**Information Requests** Response to Additional Information Request #13 (AIR-12.04.15-13 of CEAR Document #388) **RBT2 Website** Field Study Information Sheets: http://www.robertsbankterminal2.com/environmental-assessment/field-studies/ Baseline Field Studies Terms of Reference: http://www.robertsbankterminal2.com/wp-content/uploads/RBT2-Baseline-Field-Studies-Terms-of-Reference-June-2013.pdf

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Stated that TFN is of the view that the temporal scope of studies for RBT2, and the description of existing conditions is incremental, not cumulative. Stated that TFN measures Project effects by comparing change against the natural and unchanged environment, not change since the most recent development.		*The VFPA produces monthly field studies information sheets summarising work to occur each month. These updates are available at: http://www.robertsbankterminal2.com/environmental-assessment/field-studies/.* *The VFPA recognises continued consultation with Tsawwassen First Nation Crabbers and Elders will continue to help inform the studies. The VFPA is committed to share the results of this consultation with Tsawwassen First Nation.* *Studies were discussed in greater detail during Spring and Fall workshops held in 2014. Additional information on the Baseline Field Studies, including Terms of Reference is available on the Project website (http://www.robertsbankterminal2.com/wp-content/uploads/RBT2-Baseline-Field-Studies-Terms-of-Reference-June-2013.pdf) and provides greater detail on the timing and methodology for field studies."* **26-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included appendices in regards to the technical data reports.		
TFN-7.6	Concerned that a larger study area for the economic assessment will dilute the effects from the Project, and neglect negative economic effects that are more difficult to measure.	27-May-2014, Technical Working Group Meeting #3	**27-May-2014, Working Group:** Responded that there is a need to balance the size of the assessment area. If it is too large, the impacts are diluted but if it is too small, the impacts are too concentrated. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included Section 20.0.	**Addressed in EIS Sections 20.0 and 20.3.1:** Additional information is provided in the EIS, with the study areas for each individual VC described in their respective sections in the EIS. For the Economic Development VC, see EIS Sections 20.0 and 20.3.1. The LAA was established to encompass the area within which the Project is expected to interact with and potentially have an effect on economic development. In determining LAA boundaries, consideration was given to the location of materials, goods, and service suppliers for industrial construction projects and port operation in B.C., including in the LAA; the Project's likely geographic sourcing of materials, goods, and services to construct and operate the Project; and the maximum extent of the Project's potential effects on economic development. The selected study area for the LAA captures the Project's economic development effects that will occur locally. This framing of the local study area for assessment of potential effects to economic development is consistent with practices in B.C. for EAs carried out under the *CEAA, 2012* and the *B.C. Environmental Assessment Act*. Although the LAA spatial or geographic area is Metro Vancouver and the assessment focus is on its general population, potential effects are considered for the Indigenous population within Metro Vancouver. As well, specific consideration is given to existing economic conditions in the Corporation of Delta, as it is the nearest municipality to the Project and is the location of other port facilities. Specific consideration of potential effects of the Project on Tsawwassen First Nation are also examined, as this Nation's community is near the Project site and Tsawwassen First Nation and the VFPA have existing agreements with respect to contracting and business opportunities.	**EIS** 20.0 Economic Development 20.3.1 Spatial Boundaries

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				The regional assessment area (RAA) is the Province of B.C. and was established to provide a regional context for the assessment of Project effects.	
TFN-7.7	Asked whether the Ecopath with Ecosim (EwE) ecosystem productivity model (or other models) can be used to simulate scenarios to lead to a recommendation about mitigation: can potential mitigation measures be incorporated into a model like this to predict results?	28-Oct-2014, Preliminary EIS Workshop #3	**28-Oct-2014, Workshop:** Responded that it depends on the mitigation measure. The approach this assessment takes is to look at some of the on-site mitigation and put it into the model. Some of the mitigation is too fine a scale to model. For the most part, the bigger pieces can be worked with, such as the on-site offsetting. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included Section 10.3.	**Addressed in EIS Section 10.0:** Assessing potential changes in productivity (using the RB Ecosystem productivity model) will help to determine the quantity and type of mitigation, including offsetting that may be required under the *Fisheries Act*. Randall et al. (2013) state: For major projects, productivity-based approaches that evaluate impacts to fisheries will be more meaningful than habitat measures when impacts to aquatic environments are evaluated in the EA process along with social, economic and other environmental effects.	**EIS** 10.3 Overview of Assessing Ecosystem Productivity Appendix 10-A Roberts Bank Ecopath with Ecosim and Ecospace Model Parameter Estimates Appendix 10-B Roberts Bank Ecosystem Model Development and Key Run Appendix 10-C Roberts Bank Spatial Ecosystem Model Sensitivity Analysis Appendix 10-D Roberts Bank Spatial Ecosystem Model Sensitivity Analysis
TFN-7.8	Stated that the EIS should include a statement outlining the uncertainties in the science, so as to better inform decision makers if the level of risk is acceptable. Stated that it should be understood by decision makers that there might be unintended consequences and if so, that someone is ready to step in and make adjustments as needed. Stated that decision makers need to be aware of the level of confidence that the authors have in their work. If there are questions that can't be answered be answered because of a lack of science or baseline (e.g. eulachon), then that needs to be set out.	19-Jul-2016, Issues Workshop – Musqueam First Nation / Tsawwassen First Nation #1 12-Sep-2016, Issues Workshop – Musqueam First Nation / Tsawwassen First Nation #2	**19-Jul-2016, Workshop:** Stated that in the EIS a trophic food web-based ecosystem model was used to capture biotic interactions. A lot of time was spent unpacking the uncertainty, running additional tests, running and re-running the model and trying to document that uncertainty. The VFPA has committed to follow-up monitoring and will be looking for early warning signs and testing predictions. Monitoring will be undertaken at regular intervals, and the VFPA will have alternative adaptive mitigation measures as back up. It is noted that the monitoring program is in the early phases of development and asks for feedback on Tsawwassen First Nation's preferred focus in the program's development. **12-Sep-2016, Workshop:** Stated that the uncertainty around eulachon is flagged in the EIS, in both the marine fish and the Commercial, Recreational and Indigenous Fisheries sections. **12-Sep-2017, Meeting:** The VFPA met with Tsawwassen First Nation to discuss the Follow-up Program and lessons learned from the DP3 Project. The VFPA sought feedback from Tsawwassen First Nation on the Follow Program and asked what should be considered, what was important to their community and how Tsawwassen First Nation would like to be involved going forward.	**Addressed in EIS Appendix 7.2-B (#32):** The VFPA is committed to developing and implementing a Follow-up Program for the Project. The purpose of the Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project. To ensure the Program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the EIS. The Follow-Up Program will be developed in consultation with federal agencies, including the CEA Agency, DFO, and Environment Canada. Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on the program and approving agencies have an opportunity to evaluate and approve the Program. Feedback from Indigenous groups regarding the draft Program will be sought through the VFPA's ongoing engagement initiatives. **Addressed in response to IR10-11:** The VFPA's response to Information Requirements #IR10-11 as requested by the Review Panel describes how Indigenous groups will be involved in the development, implementation and management of the RBT2 Follow-up Program.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 33.0 Environmental Management Program 33.5 Roberts Bank Terminal 2 Follow-up Program **Information Requests** Response to Sufficiency Information Request #11 (IR10-11)
TFN-7.9	Interested in the process used to identify intermediate and valued components and which species are represented by focal species.	06-Jun-2014, Aboriginal Group VC Workshop #1	**06-Jun-2014, Workshop:** Recorded comment for follow-up and the VFPA committed to provide information listing the species represented by focal species. **03-Jul-2014, Aboriginal Group VC Workshop #2:**	**Addressed in EIS Appendix 7.2-B (#25):** ICs, VCs, and VC sub-components are identified in EIS Section 8.0, which describes the overall 3-step VC selection process, including the rationale for focusing the assessment on VC sub-components. The rationale for selection of specific ICs, VCs and VC sub-components is described in each assessment section. **Additional information provided by the VFPA:**	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 8.0 Effects Assessment Methods

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Requested information listing all the potential Valued Components that were considered, and providing the rationale for their exclusion, if applicable.		Provided participants with a table listing the proposed ICs, VCs, sub-component and focal species, as well as the species represented by each VC. This information was also sent out electronically in advance of the meeting. The concept of representative species was fully explained at this time. **28-Oct-2014, Aboriginal Group VC Workshop #3:** Explained the use of representative species.	Subsequent to VC selection, VC sub-components were identified to further structure and streamline the assessment as appropriate. For example, for biophysical VCs, sub-component species or groups were chosen for their ability to represent other species that are similar in nature, occupy comparable types of habitats, serve similar ecological roles, or could otherwise be affected by the Project in an analogous way.	8.1.2 Selection of Valued Components Figure 8-1 Valued Component Selection Process Appendix 8-A Valued Component Selection Rationale Table 8-A2 Rationale for Candidate Component Exclusion Decisions and Other Considerations 13.0 Marine Fish 13.2 Selection of Marine Fish Valued Component
TFN-7.10	Concerned that humans were not included in the food web model, as Musqueam First Nation and Tsawwassen First Nation have been living at the mouth of the river for 4000 years and are deeply dependent on the environment. Stated that TFN feels that humans should be included in the ecosystem food web model, because they impact, and consume many of the other species included. Concerned with the omission of humans from the food web model.	28-Oct-2014, Preliminary EIS Workshop #3 26-Nov-2014 Health & Aboriginal Rights Workshop – Tsawwassen First Nation 19-Jul-2016, Issues Workshop - Musqueam First Nation / Tsawwassen First Nation #1	**28-Oct-2014, Workshop:** Confirmed that human beings are not included in the food web. **26-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided an advance copy of the EIS for the Project, including EIS Appendix 7.2-B which responded to questions raised by Tsawwassen First Nation to date. **19-Jul-2016, Workshop:** Recorded comment for consideration by the Project team.	**Addressed in EIS Appendix 7.2-B (#101):** The ecosystem model is described in the EIS. The model incorporated predator-prey relationships (biotic factors) and environmental factors within the marine environment, and does not incorporate anthropogenic influences such as fishing. Since changes are determined by comparing productivity in the future with the Project, to the future without the Project, the level of human influence is deemed to be the same with and without the Project, and humans are not included in the food web. **Addressed in Response to IR3-09:** IR3-09 asked the VFPA to re-run the RB model to incorporate the predominant source of fishing mortality at Roberts Bank: Dungeness crab fishing. Salmon harvesting was not included as salmon harvesting occurs over large geographic areas (i.e., Gillnet Salmon Area E, Seine Net Salmon Area B, Troll Salmon Area), and is considered limited at Roberts Bank, with only a small proportion of the salmon catch coming from areas in the periphery of or adjacent to Roberts Bank; as such salmon fishing mortality was considered to be unlikely to influence model results. The results showed that biomass and production ratios (with/without Project) from the RB model re-run, including Dungeness crab fishing mortality, are generally the same when compared to the ratios described in the EIS. The existing conditions for species included in the model are reflective of existing harvesting levels by humans; therefore, human interaction within the model is implicit.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 10.0 Biophysical Setting 10.3 Overview of Assessing Ecosystem Productivity Appendix 10-A Roberts Bank Ecopath with Ecosim and Ecospace Model Parameter Estimates Appendix 10-B Roberts Bank Ecosystem Model Development and Key Run Appendix 10-C Roberts Bank Spatial Ecosystem Model Sensitivity Analysis Appendix 10-D Roberts Bank Spatial Ecosystem Model Sensitivity Analysis **Information Requests** Response to Sufficiency Information Request #09 (IR3-9 of CEAR Document #984)
TFN-7.11	Asked if the CEA Agency would provide a rationale as to why the Review Panel would not have a mandate to make any conclusion or recommendations with respect to the justifiability of any significant adverse environmental effects.	09-Sep-2014, Letter to CEA Agency	**17-Apr-2015, Letter from the CEA Agency to Tsawwassen First Nation:** "Under *CEAA 2012*, s.52, the Minister of the Environment decides whether the project is likely to cause significant adverse environmental effects. If the Minister's decision is that the project is likely to cause significant adverse environmental effects, the matter is referred to the Governor in Council (GIC) who, pursuant to s.53 of *CEAA 2012*, will decide if the likely significant adverse environmental effects are justified in the circumstances. Before making these decisions, the Government of Canada must be satisfied that Indigenous consultation, including accommodation, has been adequate. Please see page 4 of the " Federal Environmental Assessment Handout " provided to Tsawwassen for additional details on the Minister of the	The VFPA understands that this comment is directed to the CEA Agency and has no additional information to provide.	

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			Environment's EA Decision: http://www.ceaa-acee.gc.ca/050/documents/p80054/100181E.pdf".		
TFN-7.12	Asked who, if not the Review Panel, undertakes an analysis, or makes a determination as to whether the proponent has met its obligations to consult.	09-Sep-2014, Letter to CEA Agency	**17-Apr-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"Your comment has been noted. Sections 3.6 and 3.7 have been added to the Terms of Reference to provide greater clarity about the role of the Review Panel in the Crown's consultation process which includes the clarification 'The federal government maintains the duty to consult throughout the environmental assessment process and will be responsible for the items detailed in section 3.8, where necessary.'* *Additionally, the Terms of Reference state:* *Through these Terms of Reference, the Review Panel is given the mandate to collect information on behalf of the Crown as outlined in Section 3.9 to 3.11. The federal government maintains the duty to consult throughout the environmental assessment process and will be responsible for the items detailed in section 3.8, where necessary."* *The federal government is responsible for ensuring that consultation is adequate for the purposes of federal decision making on this Project. This would include consideration of the proponent's proposed mitigation or further accommodation of potential Project impacts on the exercise of Tsawwassen Treaty rights, as appropriate."*	The VFPA understands that this comment is directed to the CEA Agency and has no additional information to provide.	
TFN-7.13	Stated that this section (section 3.5 of the TOR) seems to suggest that the Review Panel can compile information, but cannot draw conclusions or make recommendations from it. It can only present a "summary" of the information. Asked whether this information is correct? If so, asked what the rationale is for not providing the Review Panel with the authority to draw conclusions or make recommendations particularly when they are likely to be experts in the field.	19-Sep-2014, Letter to the CEA Agency (CEAR Document #127)	**17-Apr-2015, Letter from the CEA Agency to Tsawwassen First Nation:** As stated above, the federal government intends on using the Review Panel process to the extent possible to gather information related to the Crown's duty to consult. The Review Panel is required to gather and summarise the information provided by participants in the process. The federal government will monitor the review panel process and will be aware of the full record of information put before the Review Panel by Indigenous groups as well. The Review Panel has been mandated to provide in its report a rationale, conclusions and recommendations on the environmental assessment including any mitigation measures and follow up programs. Section 3.11 allows the Review Panel to make recommendations, which will be considered by the Crown, regarding mitigating of environmental effects related to potential impacts on potential or established Aboriginal or Treaty rights. Once the Review Panel submits its report, the federal government will decide whether or not to	The VFPA understands that this comment is directed to the CEA Agency and has no additional information to provide.	

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			adopt the recommendations contained in the Review Panel's report.		
TFN-7.14	Asked how can Section 3.7 (b) of the Terms of Reference be achieved when the Review Panel cannot make any conclusions or recommendation regarding an infringement of an Aboriginal or Treaty Right.	19-Sep-2014, Letter to the CEA Agency (CEAR Document #127)	**17-Apr-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Review Panel will take Aboriginal rights or Treaty assertions at face value. The goal of integrating Indigenous consultation into the EA process is to understand, to the extent possible, the potential for Project impacts to potential or established Aboriginal or Treaty rights and how such impacts might be avoided or reduced. The Panel's findings and conclusions with respect to environmental effects will help to inform the Crown's assessment of potential impacts of the Project on Aboriginal rights or Treaty. The Review Panel will also have a mandate to make recommendations to the federal government regarding potential impacts to Aboriginal or Treaty rights as they relate to the environmental effects of the Project.* *Please see the "Federal Environmental Assessment Handout" provided to Tsawwassen for additional details on the EA Decision Statement and follow-up programs: http://www.ceaa-acee.gc.ca/050/documents/p80054/100181E.pdf)."*	The VFPA understands that this comment is directed to the CEA Agency and has no additional information to provide.	
TFN-7.15	Asked for clarification that all of Roberts Bank proper is within the Local Assessment Area as the terms are often used interchangeably in the EIS. Stated that throughout the EIS, there is a lack of clarity regarding whether Roberts Bank North is included or not included when referring to Roberts Bank.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #231)	**30-Sep-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Agency did not request additional information for this item since there is already information provided in the EIS. Additionally, there is no requirement in the EIS Guidelines to include all of Roberts Bank. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	**Addressed in EIS Section 8.1.3.1:** Spatial assessment boundaries were identified for each VC based on the spatial characteristics of the Project and the VC (e.g., location, distribution, range), and the areas within which Project-VC interactions and effects are expected to occur. When determining the spatial boundary, the Project team also considered, as applicable, available community knowledge and Indigenous Traditional Knowledge (ITK), information on current land and resource use by Indigenous groups, and other pertinent ecological, technical, social, and cultural considerations, as well as input from government, Indigenous groups, and the public. The types of spatial boundaries established for the assessment of potential effects to individual VCs are defined in EIS Table 8-3. When the RAA differs from the area in which the residual effects of the Project on the VC are likely to combine with the effects of other projects and activities to result in a cumulative effect on the VC, a fourth type of spatial boundary, the cumulative effects assessment area, is defined. The rationale for selection of the spatial boundaries for the LAA, RAA, and, where applicable, the cumulative effects assessment area, is provided for each VC in the effects assessment sections. For each IC, a local study area (LSA) was established that encompasses the area within which the Project is expected to interact with and potentially alter the IC. In some cases, a broader area was considered in modelling or to provide context for the consideration of Project induced changes to the IC. Finally, the area for the assessment of cumulative change in each IC encompasses the area within which the Project-related changes to the IC are likely to combine with the changes due to other projects and activities to result in a cumulative change to the IC. The spatial boundaries for each IC are described in the IC assessment sections. Figures presenting the extent of IC and VC LAA and RAA are included in the EIS.	**EIS** 8.0 Effects Assessment Methods 8.1.3.1 Spatial Boundaries

Table 8: Engagement and Consultation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-8.1	Asked what the expectation of TFN is in this process. Asked where TFN and surrounding community fit into the consultation process for RBT2. Requested an open house on RBT2. Stated that TFN wants different types of meetings – as some are better for a community forum and other types are better for a higher-level meeting with council or Chief. Confirmed interest and willingness to discuss all items listed on the proposed consultation plan, including onsite mitigation, habitat offsetting and disposal at sea. Expressed preference for incorporating a timeline into the consultation plan.	03-Dec-2012, Meeting 28-Jan-2013, Meeting with Tsawwassen First Nation Advisory Council 24-Oct-2013, Meeting 16-May-2017, Meeting with Administrative Staff	**03-Dec-2012, Meeting:** Stated that this is something that needs to be discussed with Tsawwassen First Nation. Indicated a need to work out something that is realistic while still providing opportunities for input. **28-Jan-2013, Meeting:** Stated that the VFPA has a rigorous pre-EA consultation process that exceeds regulator's requirements. Indigenous group consultation is an ongoing process. **24-Oct-2013, Meeting:** Stated that the VFPA is looking for Tsawwassen First Nation's direction on what the best process moving forward would be to go through the EA and public consultation process with them. Stated that the VFPA is happy to follow whatever format works best for Tsawwassen First Nation. **27-Nov-2014, Community Open House:** The VFPA held an open house to provide an update on the status of the Project and provide further information on the EA process. Opportunities were made for Tsawwassen First Nation members to ask questions of VFPA representatives and technical specialists regarding the project. **08-Apr-2016, Letter from the VFPA:** Provided Tsawwassen First Nation with a draft consultation plan for RBT2 and sought feedback from Tsawwassen First Nation on topics of interests. **16-May-2017, Meeting:** Responded that the VFPA is open to meetings with technical staff, chief and council or community as preferred by Tsawwassen First Nation. Committed to revise consultation plan based on Tsawwassen First Nation feedback. Undertook to incorporate a timeline into the consultation plan. **30-Jul-2018, Email from the VFPA:** Provided an updated draft of the consultation plan. Requested to meet with Tsawwassen First Nation to discuss and revise the plan where necessary. Discussions are ongoing.	**Addressed in EIS Section 7.2:** The VFPA's consultation and engagement process for RBT2 is outlined in EIS Section 7.2. In addition to summarising consultation activities that have taken place to date, the section outlines the proposed ongoing consultation with Indigenous groups following submission of the EIS. Additional information provided by the VFPA: The Consultation Plan is a living document that will continue to be revised based on the priorities of Tsawwassen First Nation.	**EIS** 7.0 Engagement and Consultation 7.2 Aboriginal Engagement and Consultation

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-8.2	Requested funding to support TFN participation in the EA process for RBT2.	31-Jan-2014, Letter	**30-Apr-2014, Letter from the VFPA to Tsawwassen First Nation:** In response to Tsawwassen First Nation's request of 31-Jan-2014, the VFPA offered funding for external review of scientific studies and funding for internal capacity. Regarding other requests, the VFPA stated it would be appropriate to discuss potential funding for participation in panel review at a later date. **7-Jul-2014, Phone call:** The VFPA sought to confirm its understanding that Tsawwassen First Nation's response of 12-Jun-2014 accepted the participation funding offered in the VFPA's letter of 30-Apr-2014. Requested Tsawwassen First Nation invoice the VFPA for work undertaken to date. **19-Jun-2015, Letter from the VFPA to Tsawwassen First Nation:** The VFPA provided participation funding payment in response to Tsawwassen First Nation's invoice of 5-Jun-2015. **24-Jul-2015, Letter from the VFPA to Tsawwassen First Nation:** The VFPA provided participation funding payment in response to Tsawwassen First Nation's invoice of 15-Jul-2015. **12-Feb-2016, Letter from the VFPA to Tsawwassen First Nation:** The VFPA provided funding in response to Tsawwassen First Nation's invoice of 1-Feb-2016 related to external review of scientific studies.	**Addressed in EIS Appendix 7.2-B (#19):** The VFPA has provided or offered funding support to ensure the ongoing participation of Indigenous groups involved in the Project's consultation processes. Additional agreements were also initiated to support the development of studies regarding the Current Use. As a result of these engagement and consultation activities, Indigenous groups have provided traditional use information relating to the Project area. The VFPA participation funding agreements have been negotiated between the VFPA and Indigenous groups, either individually or through associations representing the Indigenous groups. The VFPA has provided participation funding to 12 Indigenous groups or associations representing these groups: Tsawwassen First Nation; Musqueam First Nation; Semiahmoo First Nation; Tsleil-Waututh Nation; Cowichan Tribes; Penelakut Tribe; Halalt First Nation; Stz'uminus First Nation; Lake Cowichan First Nation; Lyackson First Nation; Metis Nation British Columbia; and Hwlitsum.	**EIS** 7.0 Engagement and Consultation 7.2 Aboriginal Engagement and Consultation Appendix 7.2-A Consultation Activities by Aboriginal Group Appendix 7.2-B Aboriginal Groups Interests and Issues Table
TFN-8.3	Interested in more participation of TFN members in the EA studies, including opportunities as field assistants in the wildlife and fisheries studies. Noted that TFN members participated in studies for the Deltaport Third Berth Project and are qualified to do the work.	25-Apr-2014, Interview	**25-Apr-2014, Interview:** Recorded comment for consideration by the Project team.	**Additional information provided by the VFPA:** Tsawwassen First Nation members have been involved in field study programs for RBT2. The VFPA continues to look for opportunities for the Tsawwassen First Nation membership to become involved in RBT2-related studies as well as other VFPA initiatives. Studies Tsawwassen First Nation Members have participated in include, but are not limited to: • Northward Migration Shorebird Habitat Use Study (Spring 2012); • Western Sandpiper Genetic Study (Spring 2012); • Southward Migration Shorebird Habitat Use Study (Summer 2012); • Marine Inverts Benthic Infaunal Sampling (Spring 2012); • Marine Water and Sediment Quality Study (Winter 2013); • Marine Water and Sediment Quality Study (Spring 2013); • Marine Water and Sediment Quality Study (Summer 2013); • Dunlin Use of Fraser River Estuary Study (Winter 2013); • DAS Site Ecological Characterisation Study (Spring 2013); • Northward Migration Shorebird Habitat Use Study (Spring 2013); • Southward Migration Shorebird Habitat Use Study (Summer 2013); • Biofilm Regeneration Study (Summer 2013); • Biofilm Shear Stress Study (Summer 2013); • Shellfish Contaminant Study (Summer 2017); and	

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				• Total Suspended Solids and Turbidity Sampling (Summer 2017). Some Technical Data Reports are appendices to EIS sections, while others are available publicly on the RBT2 website: http://www.robertsbankterminal2.com/environmental-assessment/technical-data-reports/.	
TFN-8.4	Stated that given capacity constraints, it is difficult for Aboriginal groups to develop ideas for mitigation, and the responsibility should fall to the proponent and the government.	19-Jul-2016, Issues Workshop - Musqueam First Nation / Tsawwassen First Nation #1	**19-Jul-2016, Workshop:** Recorded comment for consideration by the Project team. **08-Aug-2016, Letter from the VFPA:** Provided a hand-out on onsite mitigation options and sought feedback from Tsawwassen First Nation. **12-Sep-2017, Meeting:** The VFPA met with Tsawwassen First Nation to discuss the Follow-up Program and lessons learned from the DP3 Project. The VFPA sought feedback from Tsawwassen First Nation on the Follow Program and asked what should be considered, what was important to their community and how Tsawwassen First Nation would like to be involved going forward. **12-Apr-2018, Letter from the VFPA:** Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the RBT2 Crab Mitigation Summary Overview, which detailed the following: • Mitigation measures to avoid or reduce effects to crab as outlined in the EIS; and • Additional crab harvesting related mitigation measure suggestions under review. Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.	**Addressed in EIS Appendix 7.2-B (#12):** Decisions on mitigation measures will be made following a recommendation by the independent review panel and decision by the Federal Minister of Environment. If approved, the decision statement issued by the Minister of Environment would specify the mitigation measures that the VFPA would be required to implement if the Project were to proceed. Similarly, the EA certificate, if one is issued by the Province, would also specify mitigation measures that must be implemented by the proponent. Permits issued in respect of the Project by other regulatory agencies may specify additional mitigation measures that must be implemented by the proponent. All proposed mitigation measures in the EIS were evaluated based on technical feasibility, likely effectiveness, and consideration of indirect effects that each mitigation measure may have on other VCs. **Addressed in EIS Appendix 7.2-B (#19):** The VFPA has provided or offered funding support to ensure the ongoing participation of Indigenous groups involved in the Project's consultation processes. Additional agreements were also initiated to support the development of studies regarding the Current Use. As a result of these engagement and consultation activities, Indigenous groups have provided traditional use information relating to the Project area. The VFPA participation funding agreements have been negotiated between the VFPA and Indigenous groups, either individually or through associations representing the Indigenous groups. The VFPA has provided participation funding to 12 Indigenous groups or associations representing these groups: Tsawwassen First Nation; Musqueam First Nation; Semiahmoo First Nation; Tsleil-Waututh Nation; Cowichan Tribes; Penelakut Tribe; Halalt First Nation; Stz'uminus First Nation; Lake Cowichan First Nation; Lyackson First Nation; Metis Nation British Columbia; and Hwlitsum. **Addressed in response to IR-7.31.15-12:** The VFPA's response to IR-7.31.15-12 provides a discussion of mitigation measures considered by the VFPA, including those considered and rejected. **Addressed in response to IR10-12:** The VFPA's response to IR10-12, as requested by the Review Panel, further discusses the VFPA's proposed approach to engagement and consultation with Indigenous peoples during and after the environmental review. **Additional information provided by the VFPA:** Since submission of the EIS, the VFPA has and will continue to seek input from Indigenous groups with respect to proposed mitigation measures related to the project.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table **Information Requests** Response to Information Request #12 (IR-7.31.15-12 of CEAR Document #314) Response to Sufficiency Information Request #12 (IR10-12)
TFN-8.5	Commented that as there is no time for a two way conversation, Aboriginal groups will need direction as to where to find the answers in the EIS. Aboriginal groups will also need direction on where to find answers to	07-Oct-2014, Preliminary EIS Workshop #1 26-Nov-2014, Health & Aboriginal Rights	**07-Oct-2014, Workshop:** Expressed intent to provide all the information, to provide the opportunity to ask questions in-person, and to answer questions in-person as fulsomely as possible. The VFPA will provide a complete and full answer to all questions. Any comments or suggestions related to the Project will be considered in the EIS, and the VFPA's responses and actions based on input will be recorded in the EIS.	**Addressed in EIS Appendix 7.2-B:** EIS Appendix 7.2-B lists issues raised by Indigenous groups, answers, and location of relevant sections in the EIS. The VFPA also provides responses to questions by means of this table. **Additional information provided by the VFPA:** This document contains a list of all interests and concerns raised by Tsawwassen First Nation in regards to the Project.	**EIS** 7.0 Engagement and Consultation 7.2 Aboriginal Engagement and Consultation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	questions outside the scope of the EIS. Asked if the VFPA's responses to questions and comments will be provided in the environmental impact statement (EIS), or in a separate document. Requested a clear and complete accounting of the discussion that's happened between the First Nations, the VFPA, and the government, so TFN can say with some certainty that all that's been said has been tracked and know which issues have been responded to/are outstanding. Stated that TFN would like the record of fulsome discussion to be available for the proponent and panel to use and fold into their decision making; TFN hopes that the decision reflects the input that the communities made the effort to provide.	Workshop – Tsawwassen First Nation 12-Sep-2016, Issues Workshop – Musqueam First Nation / Tsawwassen First Nation #2	**26-Nov-2014, Workshop:** Responded that a list of Tsawwassen First Nation's questions and concerns and the VFPA's responses will be included as an appendix to the EIS. It may refer the reader to a particular section of the EIS, or provide information about how it was considered. **01-Apr-2015, Letter from the VFPA:** Provided an advance copy of the EIS for the Project, including EIS Appendix 7.2-B which summarized the issues and concerns raised by Tsawwassen First Nation to date and provided the VFPA's responses. **06-May-2015, Meeting:** In response to this concern, the VFPA provided an EIS orientation presentation in order to provide an overview of the EIS and provide an opportunity for questions about the structure and organisation of the EIS. **19-Jul-2016, Workshop:** The VFPA hosted an issues workshop with the aim of reviewing concerns and issues expressed to date; better understanding the nature of each concern through discussion; and identifying ongoing concerns and discuss/plan next steps. The agenda included a discussion on salmon, eulachon, crab, fisheries, and human health. **12-Sep-2016, Workshop:** The VFPA hosted an issues workshop to discuss some of the concerns raised to date, specifically coastal geomorphology, crabs, and eulachon. Noted that the VFPA has tracked the concerns that come out of these meetings, and is continuing to do so. Undertook to consider preparing an updated consultation report for the period following EIS submittal.	Since submission of EIS, there have been opportunities for Tsawwassen First Nation to provide additional information and clarification with respect to the issues captured in Appendix 7.2-B of the EIS and Appendix 5-B of the MSA through ongoing consultation activities such as technical meetings and issues workshops.	Appendix 7.2-B Aboriginal Groups Issues and Interests Table
TFN-8.6	Stated that non-member concerns of the Project will be brought to TFN for resolution.	13-Dec-2013, Email	**13-Dec-2013:** Recorded comment for consideration by the Project team.	**Additional information provided by the VFPA:** In response to this concern, leaseholders on Tsawwassen First Nation land were invited to a community meeting on 14-Apr-2014. Since then, the VFPA has taken direction from Tsawwassen First Nation in regards to the inclusion of leaseholders at community meetings. Leaseholders also have the opportunity to participate in public open houses on the Project.	

Table 9: Environmental Assessment and Permitting Process

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-9.3	Commented that some of the Projects included on the draft Project Inclusion List are no longer designated since the change in the Canadian Environmental Assessment Act in 2012. [Concern related to inclusion list for the cumulative effects assessment].	27-May-2014, Technical Working Group Meeting #3	**27-May-2014, Working Group:** Stated that the VFPA has not taken projects off of the Project Inclusion List because they are no longer designated as projects under *CEAA, 2012*. Projects do not need to be reviewable under *CEAA, 2012* in order to be included in a cumulative effects assessment. **01-Apr-2015, Letter from the VFPA:** Provided an advance copy of the EIS for the Project, including EIS Table 8-8 Project and Activity Inclusion List.	**Addressed in EIS Appendix 7.2-B (#39):** The list of certain and reasonably foreseeable projects and activities that have the potential to interact cumulatively with the Project-related effects is in EIS Table 8-8. This list includes all projects with the potential for a cumulative interaction with the Project. The CEA Agency is the appropriate authority to address questions related to *CEAA, 2012* and designated projects. **Addressed in Response to IR4-09:** IR4-09 provides an updated project inclusion list (and vessel movement information) (as of July 1, 2017).	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 8.0 Effects Assessment Methods Table 8-8 Project and Activity Inclusion List **Information Requests** Response to Sufficiency Information Request #09 (IR4-09 of CEAR Document #1051)
TFN-9.4	Asked if the changes to the federal Fisheries Act affect the EA process. Concerned with recent changes to the regulatory framework over the last 18 months. Stated that because of changes, TFN may look to the VFPA to do more than the minimum required by the federal government.	28-Jan-2013, Meeting with Tsawwassen First Nation Advisory Council 03-Jul-2014, Aboriginal Group VC Workshop #2	**28-Jan-2013, Meeting:** Stated that any changes to the *Fisheries Act* would not materially change the rigour of assessment the VFPA is undertaking under *CEAA, 2012*. **03-Jul-2014, Workshop:** Recorded comment for consideration by EA Project team. **01-Apr-2015, Letter from the VFPA:** Provided an advance copy of the EIS for the Project, including EIS Section 6.1 Federal Involvement and Process.	**Additional information provided by the VFPA:** The Project is currently in review under the *CEAA, 2012*. As noted in EIS Section 6.1, a *Fisheries Act* Authorisation is an additional regulatory requirement, independent of the *CEAA, 2012* process.	**EIS** 6.1 Federal Involvement and Process
TFN-9.6	Asked about the BCEAO's involvement in the environmental assessment process, and whether they may decide to undertake an EA in the future, resulting in consultation burden on Aboriginal groups. Stated that it is our view that this project is subject to provincial review pursuant to provincial environmental assessment legislation. Asked if the CEA Agency will amend these Terms of Reference in the event that the Project is also considered a Provincial Project under BC law.	07-Oct-2014, Preliminary EIS Workshop #1 19-Sep-2014, Letter to the CEA Agency (CEAR Document #127)	**07-Oct-2014, Workshop:** BC EAO confirmed that they would soon clarify their role going forward. The Crown Consultation Coordinator explained the CEA Agency's federal process. **17-Apr-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Terms of Reference now reflect the requirements of the BC Environmental Assessment process in Section 2.3 b.* *The federal Crown intends to share information and analysis conducted during the consultation process with the Province of BC. Inquiries about the provincial process should be directed to the BC Environmental Assessment Office."*	**Addressed in EIS Appendix 7.2-B (#8):** On November 5, 2014, the BC EAO confirmed the Project is reviewable under Part 8 of the Reviewable Projects Regulation, *B.C. Environmental Assessment Act*. On December 19, 2014, the B.C. Minister of Environment issued an order under s. 14 of the Act establishing the Province's procedures and methods for conducting the EA for the Project. The Minister ordered that the scope of the Project is as defined by the CEA Agency in the *EIS Guidelines*; the scope of the assessment must include factors established by the federal Minister and potential adverse environmental, economic, social, heritage, and health effects, including cumulative effects, and practicable means to mitigate such potential adverse environmental effects, and potential adverse effects on Indigenous groups; the EAO will principally rely on the EA to be conducted by the federal review panel and on consultation conducted by the CEA Agency with Indigenous groups, whose interests are potentially affected by the Project; and, the EAO must make a recommendation to the Minister within 30 days of receiving notice of the decision from the federal Minister. The information presented in the EIS is intended to satisfy both federal and provincial EA requirements. More information regarding the federal EA for the Project can be found on the CEA Agency website at www.ceaa-acee.gc.ca, Reference Number: 80054. More information regarding the provincial EA for the Project can be found on the BC EAO's Project Information Centre (e-PIC) website:	**EIS** 6.0 Environmental Assessment and Permitting Process 6.2 Provincial Involvement and Process

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				http://a100.gov.bc.ca/appsdata/epic/html/deploy/epic_project_home_410.html.	
TFN-9.7	Stated that conventional scientific methodology results in subject silos where not much cross talk occurs between disciplines and some interactions within an ecosystem are ignored. Asked whether information from the various assessments has been shared across disciplines (e.g., light to wildlife sections, marine sediment/water quality to biophysical sections). Stated that in regards to the health implications from this, TFN is concerned with the tendency of EAs to examine effects in silos, and in doing so ignoring some of the interactions.	08-Oct-2014, Preliminary EIS Workshop #2 19-Jul-2016, Issues Workshop – Musqueam First Nation / Tsawwassen First Nation #1	**08-Oct-2014, Workshop:** Responded that the VFPA has interdisciplinary conversations. Stated that there is a lot of interconnection amongst all the disciplines that will be articulated as the EIS is being prepared. These interconnections will be clearly presented in the EIS. Interdisciplinary conversations have been ongoing, and has been had with regard to light. With regard to vegetation screening, something to consider (prompted by today's discussion) might be the potential for land-based habitat creation to draw wildlife out onto the causeway, potentially increasing the risk for interaction with trucks and trains, for example. **01-Apr-2015, Letter from the VFPA:** Provided an advance copy of the EIS for the Project, including EIS Section 8.0. **19-Jul-2016, Workshop:** Responded that with regard to siloed disciplines, what falls under the health chapter incorporates results from other chapters. Noted that the VFPA tried to build in health and wellness and the interconnectedness of land, animals, culture, and place. Stated that if there are any specific concerns in terms of outcomes that aren't being reflected that you want to talk more about, or things you have unresolved concerns over that you think of, we can move those forward.	**Addressed in EIS Section 8.0:** The EIS approach to assessing potential effects is extensively cross-disciplinary, resulted in a deeply interlinked assessment for RBT2. EIS Table 8-1 I shows the linkages between disciplines. EIS Figure 8-2 presents a good example of how multiple physical, biophysical and social considerations are linked. This interconnectedness is further manifested in all VC sections of the EIS, where numerous cross-disciplinary connections are made. **Addressed in response to IR3-01:** The VFPA's response to IR3-01 presents linkages between the various models used in the EA.	**EIS** 8. 0 Effects Assessment Methods Table 8-1 Intermediate Component and Valued Component Linkages Figure 8-2 Example of Pathway of Effects **Information Requests** Response to Sufficiency Information Request #01 (IR3-01 of CEAR Document #984)
TFN-9.8	Stated that according to the list set out in section 2.1 of the Review Panel Terms of Reference, mitigation measures must be taken into account for environmental effects deemed to be "significant", but should they not also be taken into account for any adverse effects where the application of suitable mitigation is prudent, constitutes a best practice, or is required to address a matters or concerns related to Aboriginal interests generally?	19-Sep-2014, Letter to the CEA Agency (CEAR Document #127)	**17-Apr-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The list in section 2.1 is taken directly from the Canadian Environmental Assessment Act, 2012 (CEAA 2012). The Review Panel must take into account the information in section 2.1 but may take into account information provided by the proponent and Review Panel participants, including Tsawwassen First Nation should you choose to participate, that relate to mitigation measures that are prudent or constitute best practices Section 4.28 (e) of the Terms of Reference requires the review Panel to include in its report an identification of recommended mitigation measures related to environmental effects defined by CEAA 2012, including, with respect to Aboriginal peoples, the effects of changes to the environment on health and socio-*	The VFPA understands that this comment is directed to the CEA Agency and has no additional information to provide.	

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			economic conditions, physical and cultural heritage, the current use of lands and resources for traditional purposes, or any structure, site or thing that is of historical, archaeological, paleontological or architectural significance. *With respect to mitigation measures that relate to concerns or Aboriginal interests, the Terms of Reference section 3.11 provides direction to the Review Panel to make recommendations to the federal Crown which, if implemented, would mitigate environmental effects of the project, including environmental effects that might adversely impact potential or established Aboriginal or Treaty rights."*		
TFN-9.9	Stated that depending on the timing of the request (referring to section 4.4 of the Review Panel Terms of Reference), this may frustrate the ability of stakeholders to provide information and receive feedback - if the Panel needs time to review or amend the Terms of Reference after the EIS is submitted, then the 'clock should be stopped' (see section 4.13), until the Terms of Reference are amended.	19-Sep-2014, Letter to the CEA Agency (CEAR Document #127)	**17-Apr-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Agency anticipates that the Review Panel will manage the timelines set out in its Terms of Reference in an efficient and timely manner."*	The VFPA understands that this comment is directed to the CEA Agency and has no additional information to provide.	
TFN-9.10	Stated that the review has a fixed time limit; if the process gets bogged down in procedural matters (such as revising the ToR) then the Panel and stakeholders have less time to process information that could be integrated into the final report and recommendations to the Minister. Asked how the CEA Agency will ensure that stakeholders have sufficient time to review information and participate in the Review Panel process.	19-Sep-2014, Letter to the CEA Agency (CEAR Document #127)	**17-Apr-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"Based on experience from previous review panel processes, the Agency anticipates that the process as set out in the Terms of Reference will leave adequate time for the Review Panel to conduct a complete and thorough EA. The Review Panel will determine the timelines for participation in consideration of its Terms of Reference and its need for input from participants."*	The VFPA understands that this comment is directed to the CEA Agency and has no additional information to provide.	

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-9.11	Stated that the TFN Final Agreement, at Chapter 15, subclause 4(c) sets out that," during the course of the Environmental Assessment conducted under the Canadian Environmental Assessment Act, Canada will give full and fair consideration to any comments provided by Tsawwassen First Nation provided under subclause 4.b, and will respond to the comments, before taking any decisions to which those comments pertain;". Requested information around how the Panel will use, incorporate and reflect aboriginal traditional knowledge that it provides, in respect of the proposed Project.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in responses to IR-7.31.15-08 and MSA IR-02.24.16-4:** How ITK was utilised in the EIS and MSA is described in the VFPA's responses to IR-7.31.15-08 and MSA IR-02.24.16-4. **Addressed in response to IR10-02:** The VFPA's response to IR10-02, as requested by the Review Panel, provides further information concerning how available Indigenous knowledge was incorporated into the EIS and MSA.	**Information Requests** Response to Information Request #8 (IR-7.31.15-08 of CEAR Document #314) Response to Additional Information Request #4 (MSA IR-02.24.16-4 of CEAR Document #386) Response to Sufficiency Information Request #02 (IR10-02)
TFN-9.12	Concerned with narrow scope of western science methods in environmental assessments. Concerned with the EA process and how it prioritizes economic results over the environment.	12-Sep-2017, Follow-up Program Meeting	**12-Sep-2017, Meeting:** Recorded comment for consideration by EA Project team in the development of the Follow-up Program.	**Addressed in responses to IR-7.31.15-08 and MSA IR-02.24.16-4:** Scientific methods as well as ITK together formed the basis of many aspects of the EIS and MSA. How ITK was utilised in the EIS and MSA is described in response to IR-7.31.15-08 and MSA IR-02.24.16-4. **Additional information provided by the VFPA:** In response to this concern, the VFPA is working with Tsawwassen First Nation and other Indigenous groups to ensure the integration of ITK into the Follow-up Program.	**Information Requests** Response to Information Request #8 (IR-7.31.15-08 of CEAR Document #314) Response to Additional Information Request #4 (MSA IR-02.24.16-4 of CEAR Document #386)

Table 10: Environmental Management Program

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-10.1	Stated a preference for a similar approach to the adaptive management process used for DP3 be used for RBT2, where changes can be made if mitigations do not go as planned. Requested TFN representation on RBT2's Scientific Advisory Committee (or equivalent).	26-Nov-2014, Health & Aboriginal Rights Workshop – Tsawwassen First Nation 12-Sep-2017, Meeting	**26-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **12-Sep-2017, Meeting:** The VFPA met with Tsawwassen First Nation to discuss the Follow-up Program and lessons learned from DP3. The VFPA sought feedback from Tsawwassen First Nation on the Follow-up Program and asked what Tsawwassen First Nation felt should be considered, what they felt was important to their community and how they would like to be involved going forward.	**Addressed in EIS Appendix 7.2-B (#32):** To ensure the Program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the EIS. The Follow-up Program will be developed in consultation with federal agencies, including the CEA Agency, DFO, and Environment Canada. Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on the program and approving agencies have an opportunity to evaluate and approve the Program. Feedback from Indigenous groups regarding the draft Program will be sought through the VFPA's ongoing engagement initiatives. The VFPA is committed to developing and implementing a Follow-up Program for the Project. The purpose of the Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project. Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on the program and approving agencies have an opportunity to evaluate and approve the Program. Feedback from Indigenous groups regarding the draft Program will be sought through the VFPA's ongoing engagement initiatives. **Additional information provided by the VFPA:** The VFPA continues to consult with Tsawwassen First Nation in the development of the Follow-up Program. **Addressed in response to IR10-11:** The VFPA's response to IR10-11 as requested by the Review Panel describes how Indigenous groups will be involved in the development, implementation, and management of the RBT2 Follow-up Program.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 33.0 Environmental Management Program 33.5 Roberts Bank Terminal 2 Follow-up Program **Information Requests** Response to Sufficiency Information Request #11 (IR10-11)
TFN-10.2	Stated they hope the information they provide with respect to the Follow-up Program is weighed in a way that reflects the Project is in "our front yard" as opposed to groups who are not in the same proximity but does not discourage VFPA engagement with those groups. Requested that not all Aboriginal input is to be considered equally and that TFN's input is distinct based on nature of right and proximity to the Project.	12-Sep-2017, Follow-up Program Meeting 15-Sep-2017, Meeting	**12-Sep-2017, Meeting:** Recorded comment for consideration by the Project team. **15-Sep-2017, Meeting:** Recorded comment for consideration by the Project team.	**Additional information provided by the VFPA:** The *Updated EIS Guidelines* as issued by the CEA Agency directs the proponent (the VFPA) to provide sufficient data and analysis on any potential changes to the environment to permit a thorough evaluation of the environmental effects of the project by a Review Panel. The Review Panel is currently undertaking an assessment of the environmental effects of the project in a manner consistent with the requirements of *CEAA, 2012* and the Final Terms of Reference (CEAR Document #176). The Review Panel will prepare and submit a report to the federal environment Minister, who will in turn make a determination of the significance of potential environmental effects. If the Minister decides that the Project is likely to cause significant adverse environmental effects, the Minister must refer to the Governor-in-Council the matter of whether those effects are justified in the circumstances and the decision of whether the Project should be approved. **Further information provided by the VFPA:** The VFPA continues to consult with Tsawwassen First Nation in the development of the Follow-up Program.	***Updated EIS Guidelines***

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-10.3	Concerned with the VFPA's ability to regulate its tenants and/or operators and that this will affect the VFPA's ability to implement and enforce Project mitigation.	26-Nov-2014, Health & Aboriginal Rights Workshop – Tsawwassen First Nation	**26-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#192):** Describes the proposed Environmental Management framework, including compliance monitoring and reporting requirements to federal and provincial environmental regulators for both the construction and operation phases. The VFPA is committed to implementing all mitigation recommended by the Minister of Environment if the Project is approved. The VFPA takes a precautionary approach and upholds a high level of environmental protection within VFPA jurisdiction that meets or exceeds legislative requirements. **Addressed in EIS Section 4.0:** Describes the construction components of the marine terminal that will be the Infrastructure Developer's responsibility, while the Terminal Operator will be responsible for constructing and installing terminal infrastructure from the pavement up. Breaches of contractual terms are governed by the agreements' terms as well as by the common law. **Addressed in response to IR1-01:** The VFPA's standard form lease has numerous provisions that require the tenant to be a prudent and careful manager of the federal real property it leases. Examples of these provisions are the obligation to carry out regular safety inspections; to maintain the premises in a clean and sanitary condition; to comply with all rules and regulations established by the VFPA; to abide by all applicable statutes; to avoid contamination; to undertake periodic environmental tests as directed by the VFPA; and to obtain approval of any proposed improvements on the leased premises prior to undertaking the work. On an ongoing basis, the VFPA monitors the federal real property and waters occupied by its tenants. As with existing tenants, the Terminal Operator of RBT2 will be required to discuss any issues arising under the lease and berth corridor agreements with the VFPA. These meetings are often held on the lease site, to allow VFPA staff to determine if the conditions of the lease agreement are being met. Similarly, the VFPA's environmental experts will regularly attend pursuant to the terms of the lease, especially if there are outstanding obligations to undertake environmental tests for contamination or upgrade certain equipment or practices. Other VFPA staff, such as from the Engineering and Planning and Development departments, may also undertake site visits / inspections as needed to monitor compliance with VFPA permit conditions. As stewards of the federal real property, the VFPA requires its tenants not to contaminate the lands and waters, enforcing this by requiring that an environmental baseline is included as a provision in the agreements. Subsequent, regular, environmental tests required under the lease then record whether this baseline is exceeded. Additional lease provisions set out obligations of the tenant to remediate any contamination discovered by these periodic environmental tests.	**EIS** 33.0 Environmental Management Program http://www.portvancouver.com/development-and-permits/project-and-environmental-reviews/ **Information Requests** Response to Sufficiency Information Request #01 (IR1-01 of CEAR Document #897)
TFN-10.4	Asked whether there is a period of time that is quantified for ongoing monitoring. Requested that the monitoring period be long enough to assess whether or not the measures were successful. Stated that it is TFN's belief eight years is still considered short-term.	28-Oct-2014, Preliminary EIS Workshop #3 26-Nov-2014, Health & Aboriginal Rights Workshop – Tsawwassen First Nation 12-Sep-2017, Meeting	**28-Oct-2014, Workshop:** Stated that no detailed commitments to a specific plan or period of time have been made yet. At this point, the potential requirement for such a plan/strategy is just being identified, and the commitment at this point is simply to monitor. **26-Nov-2014, Workshop:** Recorded comment for consideration by the Project team.	**Addressed in EIS Appendix 7.2-B (#32):** To ensure the Program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the EIS. The Follow-Up Program will be developed in consultation with federal agencies, including the CEA Agency, DFO, and Environment Canada. Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on the program and approving agencies have an opportunity to evaluate and approve the Program. Feedback	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 33.0 Environmental Management Program 33.5 Roberts Bank Terminal 2 Follow-up Program

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Noted concern regarding short term monitoring and wish to see a longer term monitoring that can look at cumulative change. Stated the monitoring program should reflect the lifecycle of the Project but noted the frequency or intensity of some monitoring could possibly be changed once the system stabilizes following a change instead of a complete halt. Noted the monitoring program should be set-up as an initial phase, secondary phase and tertiary along with a set of rules and conditions.	15-Sep-2017, Meeting	**12-Sep-2017, Meeting:** The VFPA met with Tsawwassen First Nation to discuss the Follow-up Program and lessons learned from DP3. The VFPA sought feedback from Tsawwassen First Nation on the Follow-up Program and asked what Tsawwassen First Nation felt should be considered, what they felt was important to their community and how they would like to be involved going forward. Recorded comments for follow-up. **15-Sep-2017, Meeting:** Committed to work together to develop how the VFPA can assist with Tsawwassen First Nation member development related to the Follow-up Program.	from Indigenous groups regarding the draft Program will be sought through the VFPA's ongoing engagement initiatives. **Addressed in EIS Section 33.5:** As noted in EIS Section 33.5, in developing the FUP, the VFPA will indicate the duration and frequency of field data collection based on an evaluation of the length of time needed to detect effects given observed environmental variability, likely magnitude of environmental effect, and desired level of statistical confidence in the results.	
TFN-10.5	Stated that Chapter 15 Clause 4 (b) of the TFN Final Agreement provides TFN with the opportunity to comment on not only the scope and environment effects of a Federal Project, but also any mitigation measures and follow-up programs that are to be implemented. In light of this Treaty obligation, we would like to ensure that we have the opportunity to comment on the draft of the Final Report in advance of it being submitted to the Minister, which is likely to include a list of proposed mitigation measures and follow-up programs.	19-Sep-2014, Letter to the CEA Agency (CEAR Document #127)	**17-Apr-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Agency has reviewed Chapter 15 Clause 4 (b) of the TFN Final Agreement. The TFN will have the opportunity to comment on any mitigation measures and/or follow-up programs at any point during the EA process. Additionally, a very useful point in the EA process for discussions relating to mitigation measures and follow-up programs will be during consultation between the Crown and Tsawwassen First Nation on the Minister of the Environment's draft EA Decision Statement conditions and review panel report. Please see pages 4 to 6 of the "Federal Environmental Assessment Handout" provided to Tsawwassen for additional details on the EA Decision Statement and follow-up programs: http://www.ceaa-acee.gc.ca/050/documents/p80054/100181E.pdf)."*		
TFN-10.6	Stated that section 33.0 of the EIS presents an overview of the contingency and response plans. Stated that the detail called for in the EIS Guidelines is not in Section 33.0 as the language in that section speaks to what will be presented in the final plans. Ideally, this information would be provided in the EIS.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #231)	**30-Sep-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires this information to inform its sufficiency review."* The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 33.2:** To ensure their alignment with all required Project permits, any conditions of approvals, final designs, finalised construction or operation approaches, and site-specific considerations, the Project's Environment Management Plans are necessarily developed and finalised nearer to the start of the construction and operation phases.	**EIS** 33.2 Environmental Management Plans
TFN-10.7	Stated that there needs to be a written description in the EIS of how the components of the Environment Management Plan address the EPP (Environmental Protection Plan) and EMS	15-Jun-2015, Letter to the CEA Agency (CEAR Document #231)	**30-Sep-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Agency did not request additional information for this item since there is already some information provided in the EIS. The*	**Addressed in EIS Section 33.2:** To ensure their alignment with all required Project permits, any conditions of approvals, final designs, finalised construction or operation approaches, and site-specific considerations, the Project's Environment Management Plans are necessarily developed and finalised nearer to the start of the construction and operation phases.	**EIS** 33.2 Environmental Management Plans

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	(Environmental Management System) requirements of the EIS requirements. The application would benefit greatly from presentation of a diagram (and associated written description) that shows the various components of the EPP/Environment Management Plan/EMS, including responsibilities, lines of authority and communication, monitoring actions, communication and reporting, etc.		*Panel will determine whether it requires this information to inform its sufficiency review."* The VFPA has reviewed this letter and provides the following additional information.		
TFN-10.8	Stated that considering that the entire EIS is based on predicting (with a stated level of certainty) the effects of a proposed project and that means of avoiding and mitigating adverse effects have been proposed and that the prediction of the residual effects presented in the EIS takes those into account, then it seems entirely plausible that the detailed structure and scope of the monitoring studies that are needed to validate the predictions are amenable to being drafted at this time. Thus, we submit that much more can and needs to be stated with regard to the content of the Follow-up Program as contained in the EIS (Sections 33.5 and 33A). As it currently stands, the work of developing the Follow-Up Program remains to be done post-certificate.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #231)	**30-Sep-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Panel will determine whether it requires this information to inform its sufficiency review. However, the Agency did provide some additional direction to [the VFPA] in its cover letter to the additional information requirements on July 31, 2015. The following wording is found on page 2:* *'A follow-up program is designed to verify the accuracy of the effects assessment and to determine the effectiveness of the measures implemented to mitigate the adverse effects of the project.* *The assessment of the potential environmental effects of the Project and the measures to mitigate those adverse effects will develop as the environmental assessment proceeds. [The VFPA] is advised to apply the applicable requirements of section 11.4 of the EIS Guidelines to each adverse environmental effect prediction to verify its accuracy and evaluate each mitigation measure to determine its effectiveness. These components of the follow-up program are then to be carried forward as commitments of the proponent.'"*	**Addressed in EIS Section 33.5:** Similar to the Adaptive Management Strategy for DP3, as described in EIS Section 33.5, the VFPA is committed to developing and implementing a Follow-up Program for the Project. The purpose of the Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project. To ensure the Program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the EIS. The Follow-up Program will include: • An evaluation of the adequacy of existing data to provide a benchmark against which to test Project-related effects; • A monitoring design drawing on the measurable parameters identified to be field-tested; • A methodological approach for using field-collected data to measure and verify the accuracy of the effects predicted in the EIS; • A reporting framework that defines frequency of reporting, distribution and feedback mechanisms; and • Details of the VFPA's approach to adaptive management for the Project through construction and operation. The Follow-Up Program will be developed in consultation with federal agencies, including the CEA Agency, DFO, and Environment Canada. Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on the program and approving agencies have an opportunity to evaluate and approve the Program. Feedback from Indigenous groups regarding the draft Program will be sought through the VFPA's ongoing engagement initiatives.	**EIS** 33.5 Follow-Up Program
TFN-10.9	Stated that the assessment relies heavily on the Roberts Bank Ecosystem Model. Requested that a workshop be delivered by the proponent to Tsawwassen First Nation so that we can better understand the model's output, together with the	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information. **28-Oct-2014, Preliminary EIS Workshop #3:** The VFPA described the purpose and approach for assessing productivity within the Roberts	**Addressed in EIS Section 33.5:** To ensure the Program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the EIS. The Follow-up Program will include:	**EIS** 33.5 Follow-Up Program

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	model's strengths and weaknesses. Expressed expectations that the proponent will engage in a program of environmental monitoring to bear out the results of modelling, and to adjust the mitigation plans to accommodate for unexpected results. Requested that the proponent commit to involving Tsawwassen First Nation in the design and execution of that monitoring		Bank ecosystem and asked for feedback from participants. Explained that the ecosystem approach is being used to provide a tool to assess potential changes to the marine VCs. **12-Sep-2017, Meeting:** The VFPA met with Tsawwassen First Nation to discuss the Follow-up Program and lessons learned from DP3. The VFPA sought feedback from Tsawwassen First Nation on the Follow-up Program and asked what Tsawwassen First Nation felt should be considered, what they felt was important to their community and how they would like to be involved going forward.	• An evaluation of the adequacy of existing data to provide a benchmark against which to test Project-related effects; • A monitoring design drawing on the measurable parameters identified to be field-tested; • A methodological approach for using field-collected data to measure and verify the accuracy of the effects predicted in the EIS; • A reporting framework that defines frequency of reporting, distribution and feedback mechanisms; and • Details of the VFPA's approach to adaptive management for the Project through construction and operation. The Follow-Up Program will be developed in consultation with federal agencies, including the CEA Agency, DFO, and Environment Canada. Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on the program and approving agencies have an opportunity to evaluate and approve the Program. Feedback from Indigenous groups regarding the draft Program will be sought through the VFPA's ongoing engagement initiatives. **Additional information provided by the VFPA:** The VFPA continues to consult with Tsawwassen First Nation in the development of the Follow-up Program.	
TFN-10.10	Suggested that building trust and being involved in the decision making process around monitoring programs to address concerns would go a long way, and would help the community see it as a legitimate process. Noted that they were unable to participate in the Scientific Advisory Committee for the DP3 Project and their input was not considered properly as it is based on Traditional Knowledge. Noted that participation with an RBT2 committee should include additional funding and resources to ensure they are able to properly participate. Expressed desire to be included in Scientific Advisory Committee and for the committee's decisions to be informed by TFN input. Expressed interest in having input in Indigenous Advisory Group and noted the group should be a small group that understands its purpose.	26-Nov-2014, Health & Aboriginal Rights Workshop – Tsawwassen First Nation 12-Sep-2017, Follow-up Program Meeting	**26-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **12-Sep-2017, Meeting:** The VFPA met with Tsawwassen First Nation to discuss the Follow-up Program and lessons learned from DP3. The VFPA sought feedback from Tsawwassen First Nation on the Follow-up Program and asked what Tsawwassen First Nation felt should be considered, what they felt was important to their community and how they would like to be involved going forward. [Discussions are ongoing].	**Addressed in EIS Appendix 7.2-B (#32):** The VFPA is committed to developing and implementing a Follow-up Program for the Project. The purpose of the Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project. To ensure the Follow-up Program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the EIS. The Follow-up Program will be developed in consultation with federal agencies, including the CEA Agency, DFO, and Environment Canada. Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on the program and approving agencies have an opportunity to evaluate and approve the Program. Feedback from Indigenous groups regarding the draft Follow-up Program will be sought through the VFPA's ongoing engagement initiatives. **Addressed in response to IR10-11:** The VFPA's response to IR10-11, as requested by the Review Panel, describes how Indigenous groups will be involved in the development, implementation, and management of the RBT2 Follow-up Program. **Additional information provided by the VFPA:** The VFPA continues to consult with Tsawwassen First Nation in the development of the Follow-up Program.	**EIS** 33.5 Roberts Bank Terminal 2 Follow-up Program Appendix 33-A Proposed Draft Follow-up Program Elements **Information Requests** Response to Sufficiency Information Request #11 (IR10-11)

Table 11: Human Health – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-11.1	Stated that as inhabitants of the land and users of the marine waters immediately adjacent to the Proposed Project, TFN is very concerned about potential adverse effects on human health. Stated that TFN is skeptical of the conclusions of health studies done at a wider population level, and is concerned that local impacts will be obscured. Stated that there have been few studies done specific to TFN lands and population.	16-Oct-2013, Letter to the CEA Agency 26-Nov-2014, Health & Aboriginal Rights Workshop – Tsawwassen First Nation	The VFPA has reviewed this letter and provides the following additional information. **26-Nov-2014, Workshop:** Stated that generally EAs have more data available on existing conditions, and less data available on the effects assessment. With human health it is the opposite. Health assessments are more predicated on pathways than baselines. It is difficult to quantify things like level of stress or annoyance, or importance of a given type of food in a given community. To fit in with the organisational structure of EAs, data describing existing conditions is referenced and provided, but understanding the pathways is what leads to being able to make a qualitative characterisation of an effect, and identify a mitigation approach. The information in this presentation is quite high level, and more detailed information about the data and the assessment will be in the EIS itself. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 27.0 on Human Health.	**Addressed in EIS Section 27.0:** EIS Section 27.0 presents an assessment conducted to determine potential Project-related effects on human health. The results of the human health assessment were considered in the assessments of marine commercial use, outdoor recreation, and Current Use. The Project is expected to result in measurable residual effects on human health related to exposure to air emissions during construction, and exposure to noise during construction and operation. Mitigation is expected to reduce all other residual effects to a negligible (i.e., not measurable) level. Several air emissions scenarios during construction and operation were assessed. A residual effect is associated with only one scenario related to dust generated during construction over water between the Project marine terminal and Westshore Terminals. Adverse health effects from air emissions are considered not significant, as predicted exposure levels do not exceed health thresholds. A minority of households would experience small increases in noise during construction or operation. The increase would generally be below the range of human perception, and adverse health effects related to noise are considered not significant, as predicted exposure levels do not exceed health thresholds. Confidence in the assessment is high because models used conservative assumptions and have been validated against studies or monitoring data. The Project is not expected to result in any significant adverse effects on human health. The Project is not expected to result in measurable incremental residual cumulative effects to human health. **Addressed in EIS Appendix 7.2-B (#128):** The health assessment included a focus on Indigenous communities, and relied upon information from various consultation and engagement activities (described in EIS Appendix 7.2-A). It also relied upon written sources of information provided by Indigenous groups directly, as well as information from the First Nations Health Authority. Information about traditional food consumption was gathered through existing literature (summarised in EIS Section 27.0) as well as engagement activities (summarised in EIS Section 7.0). A summary of the traditional foods consumed by each Indigenous group is included in EIS Section 32.2. A discussion of study methods is included in the EIS, including a summary of the human health risk assessment (HHRA) and health impact assessment (HIA). These studies relied on information provided directly from Tsawwassen First Nation during consultation and through a community wellbeing study provided to the VFPA, as well as other published information and data sources related to health in B.C. Indigenous communities. The human health assessment considered the subsistence food consumption of individual Indigenous groups, as summarised in EIS Section 32.2. This information was included in the evaluation of potential effects on food security, as well as health inequity. **Addressed in response to IR-7.31.15-28:** As noted in the VFPA's response to IR-7.31.15-28, the EIS presents an assessment of the effects of the Project on human health in a manner that differentiates between Indigenous and non-Indigenous people. EIS Section 27.0 and EIS Section 32.2 address potential effects of the Project related to human health. Within the human	**EIS** 7.0 Engagement and Consultation 7.2.2 Pre-EIS Submission Consultation Process Appendix 7.2-A Consultation Activities by Aboriginal Group Appendix 7.2-B Aboriginal Groups Issues and Interests 27.0 Human Health 27.4 Information Sources 27.4.2 Desktop and Field Studies 27.5.7 Food Security 27.6 Future Conditions with the Project – Potential Project-related Effects Appendix 27-A Air Quality HHRA Technical Report Appendix 27-B Noise and Vibration HHRA Technical Report 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes **Information Requests** Response to Information Request #28 (IR-7.31.15-28 of CEAR Document #314)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				health section, information is presented separately for both Indigenous and non-Indigenous populations, for both existing conditions and for effects of the Project on human health, except where those distinctions are not practical. Table IR28-1 summarises how the relevant EIS sections address differential conditions and effects between the Indigenous and non- Indigenous populations, and provides a rationale for why aspects may be presented together for those instances in which a distinction is not made.	
TFN-11.3	Noted that TFN has residential development planned for its land, and is concerned the Human Health assessment doesn't account for effects to planned future residents. Concerned that the VFPA's assessment doesn't account of TFN's growing population and how they may be affected.	26-Nov-2014, Health & Aboriginal Rights Workshop – Tsawwassen First Nation 12-Jul-2016, Meeting 19-Jul-2016, Issues Workshop - Musqueam First Nation / Tsawwassen First Nation #1	**26-Nov-2014, Workshop:** Stated that potential impacts on land are relatively small because of the distance from the Project. Exposure to air emissions is more likely over water (for example, boats in the proximity to the Project during a fisheries opening being exposed to dust from construction activities). **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **12-Jul-2016, Meeting:** Stated the VFPA plans to monitor during and after construction to see noise levels and design mitigation in consultation with those affected at that time. There is a commitment to do this. The assessment you see assumes no noise mitigation. We can't propose [additional] mitigation at this point because we don't know what the noise will be. There is an important discussion about what commitments can be made now that can be done if and when these effects occur. Stated that the VFPA can have conversations now about what monitoring could look like, and can integrate Tsawwassen First Nation's comments into its plans (i.e., related to future development). **19-Jul-2016, Workshop:** Stated that that was considered in the EIS, increase of the population in the community assessment [See EIS Section 18.4].	**Addressed in EIS Appendix 7.2-B (#129):** The predicted maximum point of impingement over land is located near the eastern edge of the causeway, where causeway widening construction activities will occur. There are no known plans for residential development in this area, which is zoned Agricultural Land Reserve on the north side of Deltaport Way, and designated as industrial use by the Tsawwassen First Nation Land Use Plan on the south side of Deltaport Way in Tsawwassen First Nation Lands (EIS Figure 26-8 Tsawwassen First Nation Land Use Plan).	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 18.4 Population 27.0 Human Health 27.6.2 Potential Effect #1 – Adverse Health Effects Related to Air Emissions in Construction Phase Appendix 27-A Air Quality HHRA Technical Report: Figure 1 - Twenty Four Hour Air Concentrations of PM10 (µg/m3) During an Average and Peak Construction Day Figure 2 - Twenty Four Hour Air Concentrations of PM2.5 (µg/m3) During an Average and Peak Construction Day
TFN-11.4	Concerned with the potential long term impacts on health related to air quality such as increased incidence of asthma in the community, COPD,	18-Nov-2013, Community Meeting	**18-Nov-2013, Meeting:** Recorded comment for consideration by the Project team.	**Addressed in EIS Appendix 7.2-B (#131):** Assessment of potential Project-related changes (including cumulative changes) to air quality and the potential for effects of those changes on human health, is included in EIS Section 27.0.	**EIS** 9.2 Air Quality 27.0 Human Health

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	emphysema, lung cancer and allergies. Requested lung capacity testing in the community. Requested additional explanation as to why a residual effect from exposure to air emissions is determined to be unlikely.	19-Nov-2013, Meeting 27-Nov-2013, Community Meeting 26-Nov-2014, Health & Aboriginal Rights Workshop - Tsawwassen First Nation	**19-Nov-2013, Meeting:** Stated that it is the mandate of Health Authorities to look into health issues. Such studies aren't easy to do and a high level of trust is needed between the community and the tester because of issues of confidentiality. There are larger air quality issues that the community is facing. **27-Nov-2013, Meeting:** Stated that the Human Health Risk Assessment will address this concern; this study is not yet complete as it is part of the EA process. **26-Nov-2014, Workshop:** Stated that the threshold is in reference to exposure at the population level, not for individuals. The residual effect is unlikely because the exposure doesn't reach the threshold for causing effects at a population level. The determination is made by predicting the potential for people to be present in the area, as well as how often and for how long an activity is anticipated to occur. It is noted that while people may not be likely to be in a situation where effects are occurring, it is still possible. **15-Jan-2014, Letter from the VFPA:** *"Based on the findings of the human health assessment, the requirements for follow-up work to improve predictive capabilities or understanding of baseline conditions will be identified by the VFPA. Monitoring programs to be implemented throughout the life of the Project will be described in the Environmental Impact Statement document to evaluate the effectiveness of mitigation measures and guide subsequent management actions. Lung capacity testing is part of the mandate of the Health Authorities. These types of studies require a high level of trust between the community and the tester because they involve confidential information."* **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and	The Project is not expected to result in any significant adverse effect on human health, including from changes in air quality. During operation, it is unlikely that Project-related exposures to air emissions would result in health effects. The only residual effect associated with air quality changes would be experienced by individuals on the water near the terminal during construction due to short-term and infrequent dust generation.	27.6 Future Conditions with the Project – Potential Project-Related Effects 27.6.1 Rationale for Determination of Negligible Effects 27.6.5 Potential Effect #4 – Adverse Health Outcomes due to Changes in Health Inequity 27.7 Mitigation Measures 27.8 Characterisation of Residual Effects and Context 27.11 Summary of Residual Effects and Residual Cumulative Effects for Human Health, Table 27-24 Appendix 27-A Air Quality HHRA Technical Report

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			interests and provided the VFPA's responses.		
TFN-11.5	Concerned with potential impacts from noise to health and outdoor recreation. Requested assurance that health impacts from noise will be captured within the EIS.	16-Dec-2013, Email	**21-Jan-2014, Letter from the VFPA:** Noise will be included under the Human Health VC. **13-Jun-2016, Letter from the VFPA:** Provided a revised version of EIS Section 27.0 and EIS Appendix 27-B. In the process of responding to the CEA Agency's IRs, it was determined that the correct and measurable noise effect (sleep impairment) had not been carried forward for a significance determination of the residual effect, and for a cumulative effects assessment. Revisions were made to EIS Section 27.0 and EIS Appendix 27-B to provide supporting analysis. The section also includes revisions related to the comparison of noise levels to international thresholds for speech comprehension and sleep impairment. The overall conclusions of the assessment have not changed. The VFPA invites the Tsawwassen First Nation to meet to discuss the updated Human Health Assessment and any concerns you may have. **12-Jul-2016, Meeting:** The VFPA met with Tsawwassen First Nation to provide a high-level summary of the RBT2 Human Health Effects Assessment, to describe the changes in the revised assessment, to discuss the revised conclusions with respect to Tsawwassen First Nation, and to provide an opportunity for questions and discussion. Noted that the assessment of noise-related health effects now includes a greater level of detail regarding: • Indicators for sleep-related health effects from noise; • International noise thresholds for health effects; • Analysis of how many homes may be affected by noise (and where); and • Definition of significance.	**Addressed in EIS Sections 9.3 and 24.0:** Changes to the quality of outdoor recreation resulting from noise and vibration is assessed in the EIS. Outputs from the Noise and Vibration IC (EIS Section 9.3) are considered in the assessment of potential effects to outdoor recreation in EIS Section 24.0. Expected noise conditions east of the Project (where recreational boating and windsport activities occur) are anticipated to be above 60 A-weighted decibels at a distance of 3 km from the Project, and above 50 dBA at a distance of 6 km. During the Project's construction and operation phases, noise increases at these distances is projected to be less than 3 dBA (EIS Section 9.3 Noise and Vibration). It is anticipated that the sound of recreational vessel engines, water and wind will limit the perceptibility of Project-related noise changes by recreational boating and windsport user groups when near Roberts Bank, but the level of impact will be dependent on factors such as wind direction and weather conditions, and as such cannot be quantified. For this reason, the effect from noise to outdoor recreation is assessed to be negligible in the EIS. **Addressed in EIS Appendix 7.2-B (#43):** The potential changes in noise and vibration that may be caused by the Project, and the potential effects of those changes on biophysical VCs and human health are considered in the EIS. Mitigation measures to address noise-related effects are also described in the EIS. The noise and vibration assessment examined potential changes in noise and vibration as a result of the Project. The results of the noise and vibration assessment were used in the assessments of coastal birds, marine commercial use, outdoor recreation, human health, and Current Use. The assessment considered the potential changes in noise and vibration that may result from the Project and the potential cumulative changes in noise and vibration that are likely to result from the Project in combination with other certain and reasonably foreseeable projects and activities, including incremental marine vessel traffic. • The assessment considers noise and vibration from trains, as a source contributing to existing conditions, as well as a potential Project-related source of noise and vibration and a potential source of cumulative change in noise and vibration. • Mitigation measures related to noise are included in (EIS Section 27.9.2). The assessment considered Project-related sources of noise and vibration, including construction equipment, container ships at berth, container handling activities, and movement of trains and trucks on the terminal and causeway. The assessment focused on continuous noise, low frequency noise, transient and impulsive noise, and ground-borne vibration. The assessment concluded that: • Project-related changes in annual average noise levels in communities near the Project are expected to be minor and, for the most part, not perceptible. • The Project, in combination with other certain and reasonably foreseeable projects and activities, is expected to result in minimal incremental cumulative changes to noise in areas close to road and rail corridors. • Some changes in noise conditions that could be perceptible include: ○ Increased noise during periods of peak construction activity.	**EIS** 24.0 Outdoor Recreation 24.6.1 Recreational Boating and Windsport Activities - Rationale for Negligible Effect Determination 27.0 Human Health 27.6 Future Conditions with the Project - Potential Project-Related Effects: 27.6.3 Potential Effect #2 – Adverse Health Effects Related to Noise 27.6.4 Potential Effect # 3 – Adverse Health Effects Due to Stress and Annoyance 27.6.5 Potential Effect # 4 – Adverse Health Outcomes due to Changes in Health Inequity 27.7.2 Mitigation Measures, Mitigation Measure #2 - Measures to Address Noise-related Effects **Information Requests** Response to Additional Information Request #13 (AIR-12.04.15-13 of CEAR Document #388) Schedule 13-10 – Human Health

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			Explained that the overall conclusions of the human health assessment remain the same.	○ The number of intermittent noises during operation would increase, but the noise levels would be the same or lower than from the existing Roberts Bank terminals. ○ Increased noise in marine areas is expected to be perceptible close to the terminal. **Additional information provided by the VFPA:** The VFPA issued a revised version of EIS Section 27.0 and EIS Appendix 27-B Human Health Risk Assessment – Noise and Vibration (see CEAR Document #412). In the process of responding to the AIR-12.04.15-13 – Schedule 13-10, it was determined that the correct and measurable noise effect (sleep impairment) had not been carried forward for a significance determination of the residual effect, and for a cumulative effects assessment. Revisions were made to EIS Section 27.0 and EIS Appendix 27-B to provide supporting analysis; this informs the assessment provided in AIR-12.04.15-13 – Schedule 13-10. The section also includes revisions related to the comparison of noise levels to international thresholds for speech comprehension and sleep impairment. The overall conclusions of the assessment have not changed.	
TFN-11.6	Concerned that adverse impacts from the Project are most likely to be experienced locally, (and in close proximity to the Project) whereas positive impacts such as increased employment opportunities will not necessarily be experienced locally (and are more likely). Concerned that the negative effects of the Project are disproportionately felt locally, while the benefits are experienced on a national scale.	19-Nov-2013, Meeting 26-Nov-2014, Health & Aboriginal Rights Workshop – Tsawwassen First Nation 12-Sep-2016, Issues Workshop – Musqueam First Nation / Tsawwassen First Nation #2	**19-Nov-2013, Meeting:** Recorded comment for consideration by Project team. **26-Nov-2014:** Stated that the EIS does not incorporate a meta-analysis of overall weighting of costs. Potential adverse effects will be provided on a VC level and mitigation will be presented. The overall analysis of weighing the costs or benefits doesn't happen through a technical discipline process. Ultimately the decision-maker for the Project (being the Minister or the Governor-in-Council, as applicable) will make the determination as to whether to approve the Project and in making that decision, will consider the whole range of costs and benefits. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **12-Sep-2016, Workshop:** Recorded comment for consideration by Project team.	**Addressed in EIS Appendix 7.2-B (#127):** An assessment was conducted to determine potential Project-related effects on human health. The assessment was carried out using both a quantitative human health risk assessment and a qualitative health impact assessment and considered: • Exposure to air emissions; • Exposure to noise and vibration; • Exposure to shellfish contamination; • Stress and annoyance; • Employment and income; • Food security, including potential changes in availability of traditional food; and • Health inequity, referring to the distribution of Project-related risks and benefits. The sub-component of health inequity assessed potential effects related to unequal distribution of Project-related benefits and Project-related adverse effects. **Addressed in EIS Section 27.0:** In summary, health inequity is likely to indirectly increase as a result of the environmental and social changes that will result from the Project. In addition to accommodations (such as employment, training, and contracting opportunities summarised in EIS Section 32.3.3), planned mitigation measures for all Project components will help minimise the Project's contribution to health inequity. The residual effect is characterised as negligible, as these changes may adversely affect individuals but are unlikely to be detectable at a population level. **Addressed in response to IR10-27:** The VFPA's response to IR10-27, as requested by the Review Panel, discusses potential effects of the proposed Project on existing business ventures that have been identified by Indigenous groups. **Addressed in response IR10-28:** The VFPA's response to IR10-28, as requested by the Review Panel, provides further discussion of anticipated effects on the participation of Indigenous Peoples in the labour market resulting from changes in the environment from the proposed Project and marine shipping associated with the Project. **Addressed in response to IR13-15:** The VFPA's forthcoming response to IR13-15 will further discuss the assessment of health inequity within the human health assessment.	**EIS** 27.0 Human Health 27.6.1 Rationale for Determination of Negligible Effects 27.6.5 Potential Effect #4 – Adverse Health Outcomes due to Changes in Health Inequity Appendix 27-B Human Health Risk Assessment – Noise and Vibration 32.3.3 Potential or Established Aboriginal and Treaty Rights and Related Interests, Mitigation Measures **Information Requests** Response to Additional Information Request #13 (AIR-12.04.15-13 of CEAR Document #388) Schedule 13-10 – Human Health Response to Sufficiency Information Request #15 (IR13-15) Response to Sufficiency Information Request #27 (IR10-27) Response to Sufficiency Information Request #28 (IR10-28)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				Additional information provided by the VFPA: The VFPA-Tsawwassen First Nation Memorandum of Agreement provides commitments to positive benefits from the Project for the Tsawwassen First Nation	
TFN-11.7	Asked how extraneous air quality events are accounted for in the assessment and speculation that there is no good way to predict the air quality effects on human health. Asked whether air quality monitoring tests for anything other than common particulates (for e.g. dangerous materials).	19-Jul-2016, Issues Workshop - Musqueam First Nation / Tsawwassen First Nation #1	**19-Jul-2016, Workshop:** The VFPA indicated that there would be follow up with the Air Quality technical specialist with respect to the data around specific events.	**Addressed in EIS Section 30.0:** EIS Section 30.0 presents a review of the potential effects to human health (via air quality effects) of three plausible worst-case scenario accidents and malfunctions. Overall, no significant adverse residual effects on human health would be expected. **Addressed in EIS Section 9.2.4.1:** Project-related emission sources are primarily associated with fugitive dust during the construction phase and fuel combustion in both the construction and operation phases, (i.e., from diesel-fuelled engines, with smaller emissions related to propane-fuelled CHE, and gasoline-fuelled vehicles). The contaminants of potential concern (COPCs) from these sources considered in the assessment include: • Criteria air contaminants (CACs) – carbon monoxide (CO), nitrogen oxides (NO_x), sulphur dioxide (SO_2), particulate matter (PM), inhalable particulate matter (particulate matter up to 10 micrometres in size) PM_{10}, fine particulate matter (particulate matter up to 2.5 micrometres in size) $PM_{2.5}$, and ground-level ozone (O3); • Trace organic contaminants (TOCs) – Trace contaminants that are known to be emitted from combustion in engines, including acrolein, benzene, 1,3-butadiene, acetaldehyde, formaldehyde, naphthalene, polycyclic aromatic hydrocarbons represented by benzo(a)pyrene, and diesel particulate matter (DPM); • Greenhouse gases (GHGs) - carbon dioxide (CO_2), methane (CH_4) and nitrous oxide (N_2O) expressed as carbon dioxide equivalent (CO_2e); and • Climate forcing particulate matter – black carbon, also expressed as CO_2e. Black carbon is emitted from combustion processes. Black carbon plays a role in climate forcing as it absorbs solar radiation, influences cloud processes and alters the melting of snow and ice cover. **Additional information provided by the VFPA:** Air quality monitoring can test for a wide range of parameters beyond particulates, including O_3, NO_2 and SO_2. As part of DP3, the VFPA funded the establishment of the Tsawwassen Air Quality Monitoring Station (T39). The location of the station, at Pebble Hill Reservoir located at 411 Milsom Wynd in Delta, was chosen by the Delta Air Quality Monitoring Technical Working Group (composed of representatives from Corporation of Delta, Environment Canada, Metro Vancouver, Tsawwassen First Nation, and the VFPA). The station is comprised of equipment including ozone and particulate monitoring technologies (including for CO, nitric oxide (NO) and NO_2, SO_2, O_3 and $PM_{2.5}$, as well as the meteorological parameters of wind speed, wind direction and temperature). This station is part of Metro Vancouver's regional air quality monitoring network and results from the station can be viewed in real-time at www.bcairquality.ca/readings. The analysis of the data from this station indicates that there has been a reduction in both sulphur dioxide (SO_2) and fine particulate matter ($PM_{2.5}$) concentrations measured at this monitoring station after the implementation of the requirements for low sulphur fuels from ships under the North American Emission Control Area (ECA) regulations. Currently, the levels of all COPCs are below the most stringent air quality criteria. With respect to extraneous air quality events, these are also captured at the air quality monitoring stations, but were omitted from the background concentrations used in the RBT2 Air Quality Study. Smoke due to wildfires has been observed to	**EIS** 9.2 Air Quality 9.2.4.1 Compounds of Potential Concern 30.0 Potential Accidents or Malfunctions

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				increase $PM_{2.5}$ and/or ozone concentrations. For example, data from Station T39 in for the period of June 2010 to December 2012 indicated that the observations were below the ambient air quality objectives for Metro Vancouver, except for peak $PM_{2.5}$ and ozone levels during regional scale air quality advisories for $PM_{2.5}$ from smoke due to wildfires in August 2010 and for ozone in August 2010 and 2012.	
TFN-11.8	Stated that TFN does not agree with the EIS conclusions that the impact on crabs will be minor. Clarified that this concern is not a rights and title issue, but an impact on TFN member health and welfare.	27-Jul-2016, Chief & Council Meeting	**27-Jul-2016, Meeting:** Recorded comment to share Tsawwassen First Nation's view with the Review Panel.	**Addressed in EIS Sections 12.0 and 21.0:** Detailed assessment of the projects potential effects to crabs is provided in EIS Section 12.0. As noted in EIS Section 21.0, the Project is expected to result in a residual effect of changes to seafood harvesting area, harvest and revenue. This residual effect (related to the displaced crab harvesters) is determined to be not significant, however, as Dungeness crab are known to move substantial distances to baited traps, and harvest activity can be moved to another open area. The potential for an adverse effect related to changes in access to preferred Current Use locations for crab is discussed in EIS Section 32.2.6. With the implementation of mitigation measures (Section 32.2.7), residual Project-related effects on Current Use are expected to be negligible (Section 32.2.8). Measures proposed to reduce potential effects include: • Working with DFO to engage with commercial crab harvesters to identify and implement feasible mitigation measures; and • Implementation of construction and operation environmental management plans related to construction-phase communication, construction monitoring and crab salvages **Addressed in response to IR7-34:** As noted in the VFPA's response to IR7-34, mitigation measures currently undergoing consultation and evaluation include: • Crab Management Area re-selection opportunity; • Adjustment of proposed navigational closure area expansion with consideration of commercial harvesting during Project operation; • Adjustment of the proposed navigational closure area expansion with consideration of Indigenous harvesting during operation; • Navigational Limited Access Fishing Area (multi-user system during operation); and • Financial compensation. The evaluation of additional mitigation measures is being informed by consultation with commercial crab harvesters (including the Area I Crab Fisherman Association), Indigenous groups, DFO, and may include other relevant regulatory agencies regarding their specific interests and concerns. Evaluation of technical and economic feasibility of the suggested measures is currently underway to inform this consultation. Technical feasibility considers the following: • Availability, applicability, and effectiveness of the specific technology; • Fit with local site characteristics, Project design, construction schedule; • Applicable regulatory frameworks; and • Whether implementation is within the VFPA's jurisdiction. Economic feasibility considers the following: • Scope of the Project design (Project re-design not required); • Construction schedule (Project construction delay not required); and • Total cost of implementation of each measure during construction and/or operation. **Addressed in response to IR13-16:** The VFPA's forthcoming response to IR13-16 will further provide an update concerning ongoing consultation related to crab harvesting.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 12.0 Marine Invertebrates 21.0 Marine Commercial Use 21.7 Future Conditions with the Project – Potential Project-related Effects 21.10 Determination of Significance of Residual Adverse Effects Table 21-10 Summary of Determination of Significance of Residual Effects for Marine Commercial Use 24.0 Outdoor Recreation 24.6 Future Conditions with the Project – Potential Project-related Effects 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2.6 Current Use of Land and Resources for Traditional Purposes, Future Conditions with the Project – Potential Project-related Effects 32.2.7 Current Use of Land and Resources for Traditional Purposes, Mitigation Measures Current Use of Land and Resources for Traditional Purposes, Characterisation of Residual Effects and Context **Information Requests** Response to Sufficiency Information Request #34 (IR7-34 of CEAR Document #1172) Response to Sufficiency Information Request #16 (IR13-16)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-11.9	Stated that an assessment of less-than-lifetime exposure should be completed or additional rationale should be provided to justify the absence of an assessment of cancer risks for the project.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 27.9.2:** As noted in EIS Section 27.9.2, adverse health effects from air emissions are characterised as not significant, since the predicted levels of exposure do not exceed toxicological health thresholds; i.e., the risk quotients and incremental life time cancer risks indicate acceptably low levels of risk. Further information is presented in EIS Appendix 27-A, Section 4.2.4 Chronic Inhalation: Carcinogenic Effects.	**EIS** 27.0 Human Health 27.9.2 Significance Determination Appendix 27-A Air Quality HHRA Technical Report
TFN-11.10	Stated that the MPOI overland was only used in evaluation of acute exposures. Limited information is provided with respect to this location. It is unclear where it is and why acute exposures alone were evaluated. Requested a figure showing the location of this MPOI over land. Further, rationale for assessing under an acute exposure alone should be provided. Requested a figure showing the location of MPOI in relation to the receptors	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR6-24:** The VFPA's response to IR6-24, as requested by the Review Panel, provides the location and value of the maximum point of impingement for both over-water and overland in all results plots and include the location of the discrete receptors.	**Information Requests** Response to Sufficiency Information Request #6 (IR6-24 of CEAR Document #1188)
TFN-11.11	Requested a verification of the calculations used to estimate the shellfish concentrations and the assumptions used to estimate BSAF.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR12-04:** The VFPA's response to IR12-04, as requested by the Review Panel, will further discuss potential effects on human health from marine resource contamination for both Indigenous and non-Indigenous populations.	**Information Requests** Response to Sufficiency Information Request #4 (IR12-04)
TFN-11.12	Requested additional explanation on why the terms in Eqn 16 and Eqn 16.1 have different values.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR12-04:** The VFPA's response to IR12-04, as requested by the Review Panel, will further discuss potential effects on human health from marine resource contamination for both Indigenous and non-Indigenous populations.	**Information Requests** Response to Sufficiency Information Request #4 (IR12-04)
TFN-11.13	Requested confirmation that review of the SENES Air Quality Study has not identified concerns/ issues that could result in changes to information/data used in the HHRA. If changes have occurred, please update the HHRA to reflect these changes.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Additional information provided by the VFPA:** The VFPA has submitted responses to all air quality information requests as part of responses to Information Request Package 6. The VFPA confirms that there is no new air quality analysis, or issues or concerns identified, that would result in changes to the human health risk assessment for air quality.	**Information Requests** Response to Sufficiency Information Request – Package 6 (CEAR Document #975)
TFN-11.14	Requested further information regarding the approved developments.	28-Oct-2016, Letter to Panel (CEAR	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 3.4.3:** EIS Section 3.4.3 presents information regarding approved developments considered in the assessment.	**EIS** 3.0 Geographical Setting 3.4.3 Projects Contributing to Expected Conditions

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Requested a list of these developments. Further, please discuss this as a source of uncertainty. Discussion surrounding the potential for underestimation of risks should be provided. A sensitivity analysis surrounding this input variable would be helpful.	Document #650)			
TFN-11.15	Stated that Benzo(a)pyrene was selected to represent all PAHs. It is unclear if this is adequately protective. Requested information related to other PAH constituents. Are there other PAH constituents that could be of concern? Discussion surrounding the concentrations that may be emitted in relation to B(a)P equivalency would also be helpful.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR12-04:** The VFPA's response to IR12-04, as requested by the Review Panel, will further discuss potential effects on human health from marine resource contamination for both Indigenous and non-Indigenous populations.	**Information Requests** Response to Sufficiency Information Request #4 (IR12-04)
TFN-11.16	Stated that the assessment does not involve construction related emissions. It is stated that these were not included based on "relatively short time frame" associated with construction vs project operations. This is a source of uncertainty. Further justification for this approach is required. Requested confirmation that the omission of this scenario does not have the potential to underestimate true risk levels. Discussion regarding the emission concentrations for the construction phase compared to those predicted for the operational phase is necessary.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 27.0:** Health risks during construction were assessed for two emissions scenarios: a peak construction day and an average construction day. Both scenarios included emissions from Project construction, as well as emissions based on expected conditions, as discussed in EIS Section 9.2. The results of the assessment notes that adverse health effects from Project-related exposures to airborne contaminants are unlikely, and further characterised as not significant, since the predicted levels of exposure do not exceed toxicological health thresholds; i.e., the risk quotients and incremental life time cancer risks indicate acceptably low levels of risk.	**EIS** 9.2 Air Quality 27.0 Human Health
TFN-11.17	Stated that a recreational user has not been evaluated under a chronic exposure scenario. Given the presence of traditional harvesters, a rationale for this exclusion is required. Please discuss the potential for recreational	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Appendix 27-A:** As stated in EIS Appendix 27-A, Sections 4.1.2, 4.2.3, and 4.2.4, risk quotients for chronic exposure during construction and operation are tabulated in the main body of the report (Table 16) for receptors including Tsawwassen First Nation, farmers, Canadian residents, and U.S. residents. The remaining RQ values are lower than those shown in summary tables, and are provided in Appendix A. These do not include receptors representing recreationists, however. It is expected that recreationists would be present at receptor areas for limited periods of time during	**EIS** 27.0 Human Health Appendix 27-A Air Quality HHRA Technical Report

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	users to frequent some of the locations considered on a regular basis? Based on personal knowledge of the area, it is possible that community members utilize the beach area near the BC Ferry Terminals on a routine basis. Discussion of uncertainty surrounding this approach may be adequate.			the summer and rarely present during winter months. Thus, their potential exposures would be acute rather than chronic. The chronic exposure assessment included permanent receptor locations where individuals could be exposed year-round.	
TFN-11.18	With respect to Table 8 – Receptor Characteristics, stated that it is unclear where the ingestion rates for TFN and shellfish consumption were sourced from. They appear to be incorrectly referenced. Further, it is unclear if these values are averages, 95% UCLMs or other statistical values. Please confirm that the ingestion rates are correct, provide the correct reference and statistical value they represent. There is uncertainty surrounding the ingestion rates used for shellfish consumption. Other sourced that provide shellfish consumption rates are available. These sources provide values greater than those used in the HHRA. Please discuss this uncertainty. Discussion regarding the sensitivity of this input parameter would also be helpful. Similar to shellfish ingestion, uncertainty exists in association with farmer ingestion rates. Discussion of this uncertainty would be helpful. Please discuss this uncertainty. Discussion regarding the sensitivity of this input parameter would also be helpful.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in Response to IR12-04:** The VFPA's response to IR12-04, as requested by the Review Panel, will further discuss potential effects on human health from marine resource contamination for both Indigenous and non-Indigenous populations.	**Information Requests** Response to Sufficiency Information Request #04 (IR12-04)

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-11.19	Stated that for Equation 2.11 the Qpi Value is "Forage 1.6", but there is no source provided. Stated that it is assumed this value is from USEPA 2005 as this is the source for all other forage values. Please confirm that this is the source.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR12-04:** The VFPA's forthcoming response to IR12-04, as requested by the Review Panel, will further discuss potential effects on human health from marine resource contamination for both Indigenous and non-Indigenous populations. **Addressed in response to IR13-06:** The VFPA's forthcoming response to IR13-06, as requested by the Review Panel, will further discuss potential effects on human health related to shellfish consumption.	**Information Requests** Response to Sufficiency Information Request #4 (IR12-04) Response to Sufficiency Information Request #6 (IR13-06)
TFN-11.20	Stated that for Equation 16 – There is no source provided for the fish lipid constant value. Please provide the source for this value.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Additional information provided by the VFPA:** The source for the fish lipid value is the US EPA Region 6 Multimedia Planning and Permitting Division. Source: US EPA.2005. Human health risk assessment protocol for hazardous waste combustion facilities. US EPA, Office of Solid Waste, EPA530-R-05-006. Available at: https://archive.epa.gov/epawaste/hazard/tsd/td/web/pdf/05hhrap5.pdf.	
TFN-11.21	Stated that in the table at top of pg. 25, there is measured lipid content values for each species assessed. It is unclear why these values were not used in the assessment. It appears that the assumed value of 0.03 was used instead. Please indicate the reason for not using the measured values over the assumed value in the calculations. Discussion with respect to conservativeness may be helpful (i.e. is use of the assumed value more conservative?).	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR12-04:** The VFPA's forthcoming response to IR12-04, as requested by the Review Panel, will further discuss potential effects on human health from marine resource contamination for both Indigenous and non-Indigenous populations. **Addressed in response to IR13-06:** The VFPA's forthcoming response to IR13-06, as requested by the Review Panel, will further discuss potential effects on human health related to shellfish consumption.	**Information Requests** Response to Sufficiency Information Request #4 (IR12-04) Response to Sufficiency Information Request #6 (IR13-06)
TFN-11.22	For the acute inhalation assessment - There is an RQ> 1 for the MPOI over water under peak construction and average construction. Based on the figures provided, it looks like there are issues with dust in the beach area by the ferry terminal. These unacceptable risk levels have been written off based on magnitude. Please confirm if the risk levels calculated consider dust suppression measures that may be used during construction. If they do not, comment on the need for dust suppression as a risk management measure.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR6-24:** The VFPA's response to IR6-24, as requested by the Review Panel, provides the location and value of the maximum point of impingement for both over-water and overland in all results plots, and include the location of the discrete receptors. The concentrations reflected in these updated figures are based on emissions before mitigation. An Air Quality and Dust Control Plan for the construction phase is proposed, as summarised in EIS Section 33.3.3.	**EIS** 33.3.3 Air Quality and Dust Control Plan **Information Requests** Response to Sufficiency Information Request #24 (IR12-24)

Table 12: Labour Market – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information

TFN-12.1	Concerned with the negative effects related to increased employment, including displacement of jobs from other areas in the local economy, and increased wages for small businesses.	19-Nov-2013, Meeting	**19-Nov-2013, Meeting:**
			Recorded comment for consideration by Project team.
			01-Apr-2015, Letter from the VFPA:
			Provided an advance copy of the EIS for the Project, including EIS Appendix 7.2-B which responded to questions raised by Tsawwassen First Nation to date, including information on the economic development assessment.
				Addressed in EIS Section 20.0:
				The Economic Development assessment includes assessment of potential adverse effects on labour market balance (including wage inflation or labour shortages). Further details on rationale for the scope, methods and conclusions are provided in the EIS.
				Addressed in EIS Appendix 7.2-B (#113):
				The economic development assessment evaluated potential Project-related effects on local and regional economies, and focused on:
				• Business revenues associated with the direct supply of materials, goods and services to the Project for construction and operation;
				• Business revenues associated with supply of inputs to the businesses that are directly supplying goods and services to the Project;
				• Induced revenues for businesses related to household spending by workers employed as a result of the Project;
				• Construction sand supply and consumption; and
				• Consistency with economic development plans.
				The economic development assessment concluded that:
				• The Project is expected to result in the following positive effects on economic development in Metro Vancouver:
				  ○ During the 5.5 year construction phase:
				  ▪ $837 million in additional gross revenues to businesses in Metro Vancouver;
				  ▪ $238 million in induced household spending in Metro Vancouver;
				  ○ During operation:
				  ▪ $31 million annually in materials, good, and services contracting revenue to the economy of Metro Vancouver; and
				  ▪ $71 million of annual induced household spending in in Metro Vancouver.
				• The Project is expected to result in an increase in materials, goods and services contracting revenues for Indigenous businesses located in Metro Vancouver.
				• The Project is expected to result in negligible effects on construction sand availability and price.
				• The Project is consistent with economic development strategies in Metro Vancouver's Regional Growth Strategy, the economic development objectives of the Corporation of Delta, and the general directions set out in the Tsawwassen Land Use Plan of Tsawwassen First Nation.
				• The Project is expected to result in positive effects to economic development in Metro Vancouver; therefore, the Project is not expected to result in measurable adverse residual effects. The Project is not expected to result in incremental adverse cumulative effects on economic development.
				The Economic Development assessment includes assessment of potential adverse effects on local sand supply, resulting from the Project-related demand, as well as potential adverse effects on labour market balance (including wage inflation or labour shortages). Further details on rationale for the scope, methods and conclusions are provided in the EIS.
				Addressed in response to IR10-27:
				The VFPA's response to IR10-27, as requested by the Review Panel, discusses potential effects of the proposed Project on existing business ventures that have been identified by Indigenous groups.

Table 13: Light – Intermediate Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-13.1	Please provide a rationale for choosing the Commission Internationale de L'Eclairage (CIE) classification systems.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR6-02:** The VFPA's response to IR6-02, as requested by the Review Panel, provides a rationale for choosing the Commission Internationale de L'Eclairage (CIE) classification system. The light study for the EIS employed the internationally recognised and accepted CIE (Commission Internationale de l'Eclairage) zone classifications. This methodology was selected because the zone classifications rely on instrument-based measurements, and are therefore considered to be an accurate and appropriate assessment metric.	**Information Requests** Response to Sufficiency Information Request #02 (IR6-02 of CEAR Document #1060)
TFN-13.2	Please calculate predicted light trespass as a percentage of existing conditions and qualify findings regarding the nature of existing conditions. For instance, Table 9.4-9 indicates that both POR2 (Mayne Island) and POR9 (the lookout location on the UEL) showed similar lux levels. What was the quality of this light? How much of this light was of natural origin in each location? Stated that with respect to light trespass, the broad four-point scale being used, coupled with limitations to the equipment (SQL meters) used to measure illuminance level does not result in a meaningful assessment of effects. Specifically, SQL meters are not well suited to differentiating between natural and artificial light. This may result in a case where a large natural increase in illuminance (the difference between a clear moonless night and a clear night on a full moon) may measure as brighter than a ship or ships on the horizon. This does not give any insight into the ultimate effect on perceived visual quality, where generally natural light sources are perceived as acceptable and artificial ones are less well tolerated.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR6-01:** The VFPA's response to IR6-01, provides additional detail on existing conditions for light, including illuminance and sky glow under varying weather conditions and seasons. Information on full moon light levels for trespass and skyglow can be found Table 3 (trespass) and Table 5 (sky glow) of EIS Appendix 9.4-A. Predicted future light trespass from the RBT2 Terminal as a percentage of existing conditions can be determined using the values provided in Table 11 of Appendix 9.4-A. As the Project contribution is 0 lux at most PORs, the percentage change from existing conditions is 0% at most PORs. The light assessment determines the contribution of light from the Project, as an artificial source, to the existing light environment. The Project light trespass contribution at POR2 (and POR9) is 0 lux. An assessment of cumulative effects on visual resources, including contributions of past and existing sources of light in the assessment area, is provided in AIR-12.04.15-13 – Schedule 13-9. This discussion is qualitative, as a determination of the relative contribution to existing light conditions from natural vs. artificial light is not technically feasible. The cumulative effects assessment for Visual Resources addresses the effect of the Project on perceived visual quality, in the context of contributions from natural vs. artificial light from other projects and activities.	**EIS** Appendix 9.4-A Roberts Bank Terminal 2 Light Assessment Study **Information Requests** Response to Additional Information Request #13 (AIR-12.04.15-13 of CEAR Document #388) Schedule 13-9 Visual Resources Total Cumulative Effects Assessment Response to Sufficiency Information Request #01 (IR6-01 of CEAR Document #1060)

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-13.3	Stated that with respect to sky glow, a more finely graded scale appropriate to measuring effects on stargazing, would be more meaningful as a tool for carry-over to the assessment of effects on Visuals Resources. For instance, the now-widely accepted Bortle Scale, a 9-point scale based on ranges of mag/arcec2 better reflects the human receptor experience of night sky change in areas, like the Gulf Islands or Brunswick Point valued for their rural quality and darker skies. Please convert changes to sky glow from % sky glow to the Bortle Scale (see sample table below) and reassess effects and significance. Please provide results in mag/arcsec2 to allow conversion to Bortle Scale. Stated that any sky glow above 200% is rated as G4, the maximum rating, indicative of "areas of high district brightness: generally urban areas having mixed residential and commercial land use with high night-time activity." Table 9.4.4, however, indicates that a full moon in an area free of artificial illumination has a sky glow value of 3000%. A full moon therefore belongs in the same category as an urban area, according to the CIE classification system. This is counter-intuitive in terms of eventual carry-over effects to visual resources, where natural sky glow is generally perceived more favourably than artificial sky glow.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR6-02:** The VFPA's response to IR6-02, as requested by the Review Panel, provides a comparison of changes in classification at each of the 12 points of reception between the CIE scale and the Bortle scale. The Project is predicted to result in a change in CIE zone classification for one POR (POR1) from G2 to G3. Using the Bortle scale, the Project is not predicted to result in a change in Bortle scale class at POR1, but is predicted to result in a change in Bortle scale class at two other PORs: POR7 (Brunswick Point) and POR11 (Existing Roberts Bank terminals). POR7, located at Brunswick Point, is predicted to change from Class 5 (Suburban sky) to 6-7 (Bright suburban sky – Suburban/urban transition). POR11, which is the existing Roberts Bank terminals, is predicted to change from 6-7 (Bright suburban sky – Suburban/urban transition) to 8-9 (City sky – Inner-city sky). **Addressed in response to IR6-02:** The VFPA's response to IR6-02, as requested by the Review Panel, describes whether the use of the Bortle scale results in any changes to the criteria ratings for the predicted change in nighttime visual resources or the determination of significance for a change in nighttime visual resources. The response notes that the change in classification identified for two of the 12 PORs (POR7 and POR11) when applying the Bortle scale would not alter the criteria ratings for the predicted change in nighttime visual resources as presented in the EIS. The assessment results when applying the Bortle scale do not result in a change to the significance determination for residual effects on nighttime visual resources as presented in EIS Section 25.9.2. With the application of the Bortle scale there remains a minor level of overall change to the nighttime viewscapes visible from the two affected PORs, and the existing visible landscape remains able to absorb evident features that are similar in character to existing levels of development. The response also provides Measured Sky Quality as (mag/arcsec^2).	**EIS** 25.0 Visual Resources 25.9.2 Significance Determination **Information Requests** Response to Sufficiency Information Request #02 (IR6-02 of CEAR Document #1060)
TFN-13.4	In regards Appendix 9.4-A Roberts Bank Terminal 2 Light Assessment Study, Section 1.2, stated that no reference in this section is made to consideration of weather and seasons as one	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR6-01:** The VFPA's response to IR6-01, as requested by the Review Panel, provides the seasonal frequency, duration and density of nighttime fog in the area encompassing the 12 points of reception and assesses the potential effects of nighttime fog on light scatter and sky glow. The response indicates that increased fog will decrease the light trespass from the Project, whereas increased cloud cover and fog would increase sky glow.	**Information Requests** Response to Sufficiency Information Request #01 (IR6-01 of CEAR Document #1060)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	of the study objectives, as required by the EIS Guidelines. Please provide information regarding weather and season effects per the requirements of the EIS Guidelines. Requested information on where in the EIS or Appendices the issue of night time light conditions in foggy conditions is identified and assessed. If this has not been addressed, please indicate why not.				
TFN-13.5	In regards to Appendix 9.4-A Roberts Bank Terminal 2 Light Assessment Study, Section 2.3, stated that EIS Chapter 9 notes that "…cloud cover can increase the sky glow level...The existing sky glow levels were thus obtained from sky quality measurements taken under minimal cloud cover… (during the new moon phase) in order to determine the greatest possible change in sky glow attributable to the project." Section 2.3 of Appendix 9.4-A, however, notes that measurements were collected at POR1 "when the sky was mainly cloudy"; at POR2 and POR3 "under partly cloudy skies"; at POR4, POR5, and POR6 "under mainly cloudy skies"; and at POR 10 "under partly cloudy skies and windy conditions." Measurements at POR7, POR8, and POR 11 were taken under mainly clear skies. Conditions under which measurements were taken at POR9 were not recorded. Stated that given that cloudy conditions are likely to result in an overestimation of baseline light conditions and a resulting underestimation of effect, please explain the discrepancy between the stated approach in the EIS and the actual methodology noted in the Appendix. Please indicate how this will affect the effects of the	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR6-01:** The VFPA's response to IR6-01, as requested by the Review Panel, discusses the effect of varying cloud cover conditions. As noted in the response light trespass is the direct illumination of nearby off-site locations from the Project. Cloud cover does not typically interact with the propagation of light from the source to nearby locations, due to the height of cloud cover. In the unlikely event that low-lying cloud cover does interact with light propagation from a light source to a receptor location that is higher up, the low-lying cloud cover would limit the propagation of light and decrease the level of light trespass at receptor locations. Cloud cover would not have an adverse impact on the measured light trespass at a given location, and therefore the light trespass levels presented in the EIS have not been adjusted for cloud cover.	**Information Requests** Response to Sufficiency Information Request #01 (IR6-01 of CEAR Document #1060)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	assessment and reassess effects with a baseline corrected for cloudy conditions.				
TFN-13.6	Concerned with light effects to health and outdoor recreation. Suggested mitigation measures include ongoing monitoring and reducing night-time light leakage.	24-Apr-2014, ITK Meeting with Elders	**24-Apr-2014, Meeting:** Recorded comment for consideration by Project team. **08-Oct-2014, Workshop:** Held an EIS workshop and presented on results of the light assessment: • Minimal increases in light trespass levels from project related activity are expected, but the overall light environment is not expected to change. • Minimal increases in sky glow levels are also expected; however, these changes will not result in a noticeable change in the visibility of the stars.	**Addressed in EIS Appendix 7.2-B (#45):** The potential changes in light that may be caused by the Project, and the potential effects of those changes on VCs and on Current Use are considered in the EIS. The results of the light assessment informed the assessments of marine fish, coastal birds, visual resources and human health, and Current Use. The assessment focused on two aspects of light: • Light trespass, the amount of light that strays from its intended purpose onto neighbouring areas; and • Sky glow, the unwanted illumination of the night sky that affects the visibility of stars. The assessment concluded that: • Overall, the Project is not expected to change the general light environment of the Lower Mainland and the Gulf Islands and no measurable incremental cumulative changes related to light are expected. • Project-related lighting is expected to result in a minimal increase in light trespass levels. • Increases in sky glow levels are expected, but are not anticipated to result in a noticeable change from existing conditions. Suggested mitigations were considered in the effects assessment. Mitigation measures to address effects on visual resources and coastal birds consist of implementation of Environmental Management Plans, including Light Management Plans, for construction and operation phases. The Light Management Plans will describe measures to reduce excess lighting and sky glow, including: • Orienting lights downwards and away from residential and marine areas; • Using shielding to minimise light trespass; • Controlling light levels and limiting light use to areas where activities are occurring; • Where possible, using fixtures that emit light at wavelengths shown to minimise disorienting effects to birds; • During construction, ensuring dredge lighting system shields light from spilling outside the basic working footprint of the dredge; and • During operation, establishing a centralised lighting control system to select lighting where required. **Addressed in EIS Sections 9.4 and 25.0:** EIS Section 9.4 and EIS Section 25.0 was completed applying the use of high pressure sodium (HPS) lighting at the Deltaport Terminal and for the proposed Project. A process is underway, however, to change the current outdoor lighting fixtures at the existing Deltaport Terminal to light-emitting diodes (LEDs). The current container terminal operator, Global Container Terminals, has introduced LEDs to a various pieces of terminal infrastructure, including but not limited to its cranes. LEDs are more energy efficient and can be easier to control in terms of where the light is focused. The continued transition to LEDs is expected to reduce both light trespass and sky glow from the Deltaport Terminal. The light fixtures and lighting design are not yet finalised for RBT2, and this will be part of the final project design phase. Given the broad uptake of LED lighting at port terminals, it is anticipated that operators of RBT2 will utilise LEDs. The VFPA is encouraging the minimisation of light pollution through its targeting of ENVISION accreditation for its major infrastructure projects, including RBT2. More information concerning ENVISION is available at: https://sustainableinfrastructure.org/envision/how-it-works/.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests 9.4 Light 9.4.4 Relevant Guidelines 9.4.8 Future Conditions with the Project 25.0 Visual Resources 25.6 Future Conditions with the Project - Potential Project-related Effects 25.7.2 Mitigation Measures, Mitigation Measure #2 – Lighting Design and Operation – Light Management Plans 27.0 Human Health 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2.1 Current Use of Land and Resources for Traditional Purposes, Indicators 32.2 Current Use of Land and Resources for Traditional Purposes 33.3.5 Construction Environment Management Plan, Light Management Plan 33.4.3 Operation Environment Management Plan, Light Management Plan

TFN-14.1	Asked about the impact from port development to land and home values.	19-Nov-2013, Meeting	**19-Nov-2013, Meeting:** Responded that the change in land value has not been assessed.	**Additional information provided by the VFPA:** Impacts that may have the potential to affect property values such as noise, light and view were included in the assessment, but an assessment specifically on the impact from port development to land and home values was not included in the EIS Guidelines and has not been completed.	

Table 15: Marine Commercial Use – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-15.1	Stated that TFN would like to ensure that effects to the commercial fishery are being adequately addressed, noting participation in the commercial fishery is not a Treaty right or an Aboriginal right, but a contractual right.	26-Nov-2014, Health & Aboriginal Rights Workshop - Tsawwassen First Nation	**26-Nov-2014, Workshop:** Recorded comment for consideration by Project team. **01-Apr-2015, Letter from the VFPA:** Provided an advance copy of the EIS for the Project, including EIS Appendix 7.2-B which responded to questions raised by Tsawwassen First Nation to date.	**Addressed in EIS Appendix 7.2-B (#116):** A description of the scope and methods of the Marine Commercial Use assessment is provided in EIS Section 21.0. • The Marine Commercial Use assessment considers potential effects on marine fish harvesting, seafood harvesting (including crab), guided sport fishing, and marine-based tourism. • The rationale for the selection of the Marine Commercial Use assessment spatial boundaries is provided in the EIS. • Relevant information was sought from all Indigenous groups that hold commercial fishing licences. • The cumulative effects assessment takes into consideration the potential residual effects of the Project in combination with the effects of other projects and activities that have been or will be carried out, including those in the lower Fraser River. **Addressed in EIS Sections 12.0 and 21.0:** Detailed assessment of the project's potential effects to crabs is provided in EIS Section 12.0. As noted in EIS Section 21.0, the Project is expected to result in a residual effect of changes to seafood harvesting area, harvest and revenue. This residual effect (related to the displaced crab harvesters) is determined to be not significant, however, as Dungeness crab are known to move substantial distances to baited traps, and harvest activity can be moved to another open area.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 8.0 Effects Assessment Methods 8.1.9 Environmental Assessment Methods, Cumulative Effects Assessment 12.0 Marine Invertebrates 21.0 Marine Commercial Use 21.2 Selection of Marine Commercial Use Valued Component 21.3.1 Spatial Boundaries
TFN-15.2	Requested a map showing both DFO sub-areas and Local Assessment Area (LAA). Concerned that the LAA may not line up with DFO sub-areas, and how impacts could be properly evaluated if this were the case.	03-Jul-2014, Aboriginal Group VC Workshop #2 26-Nov-2014, Health & Aboriginal Rights Workshop - Tsawwassen First Nation	**03-Jul-2014, Workshop:** Committed to providing a map of the commercial harvesting of invertebrates proposed assessment area overlain with the DFO sub-areas. **29-Oct-2014, Workshop:** Provided the maps requested with Tsawwassen First Nation through presentations and in hard copy as part of Preliminary EIS Workshop #2. **26-Nov-2014, Workshop:** Noted the Project area does not span multiple areas for crab (it only intersects with crab management area I). Committed to confirming this and following up about management areas for fish. **01-Apr-2015, Letter from the VFPA:** Provided an advance copy of the EIS for the Project, including EIS Appendix 7.2-B which responded to questions raised by Tsawwassen First Nation to date, including the DFO management areas.	**Addressed in EIS Appendix 7.2-B (#83):** DFO Fisheries Management Areas in the Project area are described in the EIS. The potential Project-related effects on marine fish and on commercial, recreational and Indigenous fisheries are considered within the area of maximum extent of potential adverse effects, and not by DFO Fisheries Management Area.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 13.0 Marine Fish 13.3.1 Spatial Boundaries 16.0 Ongoing Productivity of Commercial, Recreational, and Aboriginal Fisheries 16.3.1 Spatial Boundaries
TFN-15.3	Asked about the No Float Zone proposed for RBT2 and expressed concern with the anticipated reduction of currently available	22-Jan-2016, Meeting 19-Jul-2016, Issues Workshop -	**22-Jan-2016, Meeting:** Committed to providing a map of the proposed area.	**Addressed in EIS Sections 12.0 and 21.0:** Detailed assessment of the project's potential effects to crabs is provided in EIS Section 12.0. As noted in EIS Section 21.0, the Project is expected to result in a residual effect of changes to seafood harvesting area, harvest and revenue. This residual effect (related to the displaced crab harvesters) is determined to be not	**EIS** 12.0 Marine Invertebrates 21.0 Marine Commercial Use 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests,

	navigation and harvesting areas. Requested a map of the area. Concerned with the effectiveness of the proposed navigational closure and potential impacts to Aboriginal fisheries and domestic use.	Musqueam First Nation / Tsawwassen First Nation #1 01-Sep-2016, Letter	**29-Apr-2016, Meeting:** Provided the "no float zone maps" requested at the 22-Jan-2016 meeting (EIS Figures 21-6 Navigational Closure Area and Crab Harvesting and 21-8 Proposed Navigational Closure Expansion). **15-Sep-2016, Letter from the VFPA:** Explained that the VFPA determined that locating the terminal almost entirely in subtidal waters not only reduced impacts to valued environmental intertidal habitat but also minimised dredging requirements which further reduces environmental impacts on fish and fish habitat.	significant, however, as Dungeness crab are known to move substantial distances to baited traps, and harvest activity can be moved to another open area. The potential for an adverse effect related to changes in access to preferred Current Use locations for crab is discussed in EIS Section 32.2.6. With the implementation of mitigation measures (EIS Section 32.2.7), residual Project-related effects on Current Use are expected to be negligible (EIS Section 32.2.8). Measures proposed to reduce potential effects include: • Working with DFO to engage with commercial crab harvesters to identify and implement feasible mitigation measures; and • Implementation of construction and operation environmental management plans related to construction-phase communication, construction monitoring and crab salvages **Addressed in response to IR7-34:** As noted in the VFPA's response to IR7-34, mitigation measures currently undergoing consultation and evaluation include: • Crab Management Area re-selection opportunity; • Adjustment of proposed navigational closure area expansion with consideration of commercial harvesting during Project operation; • Adjustment of the proposed navigational closure area expansion with consideration of Indigenous harvesting during operation; • Navigational Limited Access Fishing Area (multi-user system during operation); and • Financial compensation. The evaluation of additional mitigation measures is being informed by consultation with commercial crab harvesters (including the Area I Crab Fisherman Association), Indigenous groups, DFO, and may include other relevant regulatory agencies regarding their specific interests and concerns. Evaluation of technical and economic feasibility of the suggested measures is currently underway to inform this consultation. Technical feasibility considers the following: • Availability, applicability, and effectiveness of the specific technology; • Fit with local site characteristics, Project design, construction schedule; • Applicable regulatory frameworks; and • Whether implementation is within the VFPA's jurisdiction. Economic feasibility considers the following: • Scope of the Project design (Project re-design not required); • Construction schedule (Project construction delay not required); and • Total cost of implementation of each measure during construction and/or operation. **Addressed in response to IR13-16:** The VFPA's forthcoming response to IR13-16 will further provide an update concerning ongoing consultation related to crab harvesting.	Including Current Use of Lands and Resources for Traditional Purposes **Information Requests** Response to Sufficiency Information Request #34 (IR7-34 of CEAR Document #1172) Response to Sufficiency Information Request #16 (IR13-16)
TFN-15.4	Stated that TFN is sceptical of the use of commercial harvesting data generated by DFO given that the commercial sector typically does not often contribute to improving the health of the environment.	19-Jul-2016, Issues Workshop - Musqueam First Nation / Tsawwassen First Nation #1	**19-Jul-2016, Workshop:** Recorded comment for consideration by Project team.	**Addressed in response to IR7-33:** As noted in the VFPA's response to IR7-33, in the October 26, 2016 submission to the CEA Agency registry, the Area I Crab Fisherman Association (AICFA) requested that the VFPA use the electronic monitoring data to analyse potential Project effects, as well as effects of the 2009 navigational closure (2009 Closure) on commercial crab harvesting. The VFPA subsequently consulted with DFO and the AICFA to request access to the CMA I electronic monitoring data, and DFO logbook and fish slip harvest landing and landing value information for the proposed navigational closure expansion and existing 2009 Closure at Roberts Bank. The two	**Information Requests** Response to Sufficiency Information Request #33 (IR7-33 of CEAR Document #1172)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Suggested that the VFPA add a multiplier to data or expression of confidence to act as a buffer in the assessment.			new sets of data from CMA I and DFO were provided to the VFPA in spring 2017 and reviewed collectively. The IR response notes it is difficult to quantifiably estimate, or predict, reductions in landing values due to the decrease in the size of the fishing areas in sub-area 9-6 and sub-area 29-7 directly attributable to the navigational closure expansion. However, the analysis of the additional DFO data on commercial crab harvest landings and landing values and CMA I electronic monitoring data supports the conclusions made in EIS Section 21.9: • The Project terminal and proposed navigational closure expansion would displace a large portion of commercial crab harvesting in the LAA, and result in a demonstrable change to harvest landings and revenues, particularly from sub-area 29-6; and • The re-establishment of displaced commercial crab harvesters and effects on commercial crab harvest landings and revenues accrued to displaced harvesters and other harvesters harvesting outside of the proposed closure boundary, would be similar to that which occurred with the 2009 Closure, and be within historical norms.	
TFN-15.5	Concerned with the use of commercial harvesting data as primary data in the assessment (it is noted the difference between Aboriginal Fisheries Strategy (AFS)) fisheries and commercial fisheries is flawed as not all AFS fishers have the opportunity to sell, among other factors such as the size of the fleet that participates).	19-Jul-2016, Issues Workshop - Musqueam First Nation / Tsawwassen First Nation #1	**19-Jul-2016, Workshop:** Responded that the data gathered in the effects analysis and Marine Commercial Use assessment was focused on the commercial fisheries. Stated that data on the food, social and ceremonial (FSC) side were considered in more detail in the Current Use assessment for the EIS. Effort was made to separate out the analyses to make sure they were reflected. Explained that the VFPA took FSC to mean a communal license, including regular FSC licenses, limited participation licenses, and licences with allowance for sale ("EO" licenses); the VFPA used "FSC" to mean these three types of licenses. The VFPA acknowledged in the EIS that, for Tsawwassen First Nation, "domestic" is the equivalent terminology to FSC. Domestic and FSC harvesting were considered in the Current Use section.	**Addressed in EIS Appendix 7.2-B (#118):** The Marine Commercial Use effects assessment includes commercial marine fish and seafood harvesting, including activities under communal commercial licenses held by Indigenous groups. Fish and seafood harvesting for food, social, ceremonial and domestic purposes (as per the AFS) by Indigenous groups are considered in EIS Section 32.0. **Addressed in response to IR13-23:** The VFPA's forthcoming response to IR13-23 will further discuss Indigenous groups' ability to harvest crab for Food, Social and Ceremonial (FSC) purposes.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 21.0 Marine Commercial Use 21.5.2 Aboriginal Commercial Fishing and Seafood Harvesting 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2.6 Future Conditions with the Project - Potential Project-Related Effects **Information Requests** Response to Information Request #23 (IR13-23)

Table 16: Marine Fish – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-16.1	Asked whether sturgeon are captured in the assessment. Asked if sturgeons are being investigated? Asked if anyone is tracking sturgeon.	28-Jan-2013, Meeting with Tsawwassen First Nation Advisory Council 07-Oct-2014, Preliminary EIS Workshop #1	**28-Jan-2013, Meeting:** Stated that several field studies are underway to characterize existing conditions. Stated that the VFPA will provide the results of all studies undertaken. **07-Oct-2014, Workshop:** Provided information about how sturgeon are considered in the assessment.	**Addressed in EIS Section 13.0:** Discussion regarding sub-component selection relative to species of importance to Indigenous groups, including eulachon and sturgeon, is captured in EIS Section 13.0. **Additional information provided by the VFPA:** Potential Project-related effects on sturgeon (white sturgeon and green sturgeon) are considered in the marine fish assessment within the Pacific salmon sub-component. Sturgeon species were not selected as a representative species due to their rarity in the Roberts Bank area. Representative species in the Pacific salmon sub-component include Chinook and chum salmon. Based on qualitative and empirical evidence considered during the marine fish assessment, minor decreases in productivity to Pacific salmon are anticipated due to direct mortality (e.g., entrainment of juveniles), and changes in the acoustic (i.e., if impact pile driving is used) and light environments during the Project's construction phase, as well as due to changes in habitat availability during Project operation. Effects on Pacific salmon associated with changes in water quality and changes in biotic interactions are considered negligible. **Addressed in responses to IR5-15 and AIR-12.04.15-09:** In its response to IR5-15, the VFPA specifically discusses existing conditions related to sturgeon and describes the status and management practices associated with the species. Rationale as to how sturgeon were assessed via use of Chinook and chum salmon as representative species, as well as similarities between species as they pertain to existing conditions (e.g., life history and habitat requirements), the mechanisms through which the Project may affect sturgeon, as well as effectiveness of mitigation, are presented in AIR-12.04.15-09, including Appendix AIR9-A Table 2; and in IR5-15 response.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 13.0 Marine Fish 13.2 Selection of Marine Fish Valued Component 13.2.1 Sub-components 13.4.1 Information Sources, Desktop and Field Studies 13.6.3 Potential Effect - Changes in Productivity **Information Requests** Response to Additional Information Request #09 (AIR-12.04.15-09 of CEAR Document #388) Response to Information Request #15 (IR5-15 of CEAR Document #1078)
TFN-16.2	Asked if the VFPA had done field work on the interruption of salmon runs. Asked if anyone is tracking salmon sockeye runs.	28-Jan-2013, Meeting with Tsawwassen First Nation Advisory Council	**28-Jan-2013, Meeting:** Stated that several field studies are underway to determine the current conditions. Stated that the VFPA will provide details on all species being investigated. Stated that the VFPA is tracking salmon runs. **25-Feb-2013, Workshop:** The VFPA held a finfish workshop with Tsawwassen First Nation fishers to learn more about their use of their fishing practices, fishing areas, species of interest. **11-Apr-2013, Workshop:** The VFPA held an elders finfish TEK workshop to obtain information on food, social and ceremonial (FSC) finfish fisheries occurring within the proposed Project Area (Roberts Bank) and the wider Fraser River Estuary by the Tsawwassen First Nation. Anecdotal information will be used to qualitatively assess which finfish species are present within the proposed Project Area (and wider Estuary); which species are of greatest importance to Tsawwassen First Nation and potentially other stakeholders in the Region; and whether the existing terminal or	**Addressed in EIS Section 13.4:** EIS Section 13.4 presents information sources used to inform the marine fish assessment, including a description of fieldwork undertaken to support the assessment. The assessment in EIS Section 13.0 focused on five sub-components: • Pacific salmon, represented by Chinook and chum species; • Reef fish, represented by lingcod and rockfish; • Flatfish, represented by English sole and starry flounder; • Forage fish, represented by Pacific herring, Pacific sand lance, shiner perch and surf smelt; and, • Demersal fish, represented by Pacific staghorn sculpin and threespine stickleback. **Addressed in response to IR5-15:** In its response to IR5-15, the VFPA specifically discusses biology, migration behaviour, habitat utilisation, the status and management practices associated with sockeye salmon (Cultus Lake) and white sturgeon. As noted in that response, assessment conclusions and mitigation measures for representative species also apply to sockeye salmon (Cultus Lake) and white sturgeon (Lower Fraser population) and remain unchanged. **Additional information provided by the VFPA:** The VFPA's response to IR5-15, IR-7.31.15-09, and AIR-12.04.15-09, further discuss how sockeye and sturgeon species are considered to be represented in the assessment by other fish.	**EIS** 13.0 Marine Fish **Information Requests** Response to Information Request #09 (IR-7.31.15-09 of CEAR Document #314) Response to Additional Information Request #09 (AIR-12.04.15-09 of CEAR Document #388) Response to Sufficiency Information Request #15 (IR5-15 of CEAR Document #1078)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			other regional developments and human- use activities have potentially affected finfish population dynamics (spatially and/or temporally) and other fish characteristics (such as size). **01-Apr-2015, Letter from the VFPA:** Provided Tsawwassen First Nation with an advance copy of the EIS, which included EIS Appendix 7.2-B.		
TFN-16.3	Stated that sockeye is most important to TFN both culturally and economically, and any assessment that doesn't fully undertake to understand the effects of the Project on sockeye is incomplete in TFN's view.	19-Jul-2016, Issues Workshop - Musqueam First Nation / Tsawwassen First Nation #1	**19-Jul-2016, Workshop:** Acknowledged the importance of sockeye, both culturally and ecologically. Stated that all pacific salmon species are accounted for in the Roberts Bank ecosystem model. Stated that it would be impractical to characterise existing conditions and assess effects a on every species that may frequent the Roberts Bank area. Biophysical VCs, sub-component species or groups were chosen for their ability to represent other species that are similar in nature, occupy comparable types of habitats, serve similar ecological roles, or could otherwise be affected by the Project in an analogous way. Stated that the VFPA picked representative species that are most likely to interact with the Project and be potentially impacted to avoid underestimating the effect. Stated that chinook and chum were selected because they are the most estuarine dependent. The assessment of chinook and chum conservatively represents the other salmon species, and also steelhead and cutthroat trout. Stated that some of the information we collected and reviewed indicates that juvenile sockeye do not use Roberts Bank in high abundance, and they also transit through the estuary relatively quickly. Stated that a large proportion of sockeye also tends to migrate north.	**Addressed in EIS Appendix 7.2-B (#171):** Potential Project-related effects on marine fish, including all five species of Pacific salmon, are considered in the EIS. In addition, the potential effects of the Project with respect to the ongoing productivity of commercial, recreational and Indigenous fisheries are evaluated in the EIS. **Addressed in EIS Appendix 7.2-B (#107):** Sockeye salmon was not selected as a representative species within the Pacific salmon sub-component, as studies indicate that juvenile sockeye salmon do not use the Roberts Bank area in high abundance, relative to chum and Chinook salmon (which have been selected as representative species in the assessment). Since chum and Chinook are the most estuarine-dependent species of salmon, the potential for Project-related interactions with these species is greatest. Results of the assessment based on these two species represent a more conservative approach, given the life histories and habitat use of chum and Chinook. Therefore, potential Project-related effects on sockeye salmon are considered within the assessment through the assessment on the sub-component Pacific salmon, as represented by chum and Chinook. Sockeye salmon are considered in the assessment of marine commercial use as the primary species of salmon sought in the assessment area. The economic component of sockeye fishing is addressed in EIS Section 21.0.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table
TFN-16.4	Stated that it looks like the Project will have adverse effects on salmon. Stated that the silt being generated from the terminal is a concern for salmon and crab.	28-Jan-2013, Meeting with Tsawwassen First Nation Advisory Council	**28-Jan-2013, Meeting:** Stated that the VFPA is looking into this and matters around geomorphology and potential movement of sand and silt. Recorded comment for consideration by Project team.	**Addressed in EIS Sections 12.0 and 13.0:** EIS Sections 12.0 and 13.0 discuss salmon and crab migration routes and lifecycles from construction and physical occupation of the Project. While the Project is predicted to cause losses of productivity of bivalve shellfish, Dungeness crabs and orange sea pens, the scale of change is minor in the context of natural variability and would not compromise the population integrity or ecological function. The assessment concludes there are no significant adverse residual effects from the Project to marine invertebrates. The Project is not expected to result in any incremental adverse cumulative effects to marine invertebrates. The assessment	**EIS** 9.6 Water Quality 12.0 Marine Invertebrates 13.0 Marine Fish

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Asked what is being done about this concern.		**01-Apr-2015, Letter from the VFPA:** Provided Tsawwassen First Nation with a copy of the EIS, which included EIS Section 12.0 Marine Invertebrates and 13.0 Marine Fish.	concludes there are no significant adverse effects from the Project, as marine fish productivity or long-term integrity would not be compromised. The Project is not expected to result in measurable incremental adverse cumulative effects to marine fish. **Addressed in EIS Section 9.6:** Changes to surficial geology and marine sediment during Project construction activities are expected to be minimal or undetectable relative to natural variability.	
TFN-16.5	Stated that any impacts to marine fish, their habitat, or our opportunity to harvest marine fish are of great concern to TFN. Stated that of particular concern is the impact of this development on TFN's ability to access fishing and harvest areas.	16-Oct-2013, Letter to the CEA Agency	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Appendix 7.2-B (#120):** In the Marine Commercial Use assessment, a residual effect is considered significant when all of the following conditions are met: • The effect occurs to a known area of commercial marine-based activity or potential; • The effect displaces or excludes commercial marine-based activities from a known use area; • There are associated adverse harvest or revenue effects due to the displacement; and • The displaced commercial marine-based activity cannot move to known alternative activity areas due to regulatory reasons. The Project is expected to result in a residual effect of changes to seafood harvesting area, harvest and revenue. This residual effect (related to the displaced crab harvesters) is determined to be not significant, however, as Dungeness crab are known to move substantial distances to baited traps, and harvest activity can be moved to another open area. The potential for an adverse effect related to changes in access to preferred Current Use locations for crab is discussed in EIS Section 32.2.6. With the implementation of mitigation measures (EIS Section 32.2.7), residual Project-related effects on Current Use are expected to be negligible (EIS Section 32.2.8). **Addressed in EIS Section 32.2.6.2:** As indicated in EIS Section 32.2.6.2, potential changes in productivity may occur for Pacific salmon, reef fish, and demersal fish, as a result of the Project; however, potential Project-related effects on those resources are not expected to result in measurable Project-related effects to Current Use of these fish. Project-related effects on access to Current Use locations for fishing are expected to be negligible during construction and operation.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 12.0 Marine Invertebrates 21.0 Marine Commercial Use 21.7 Future Conditions with the Project – Potential Project-related Effects 21.10 Determination of Significance of Residual Adverse Effects Table 21-10 Summary of Determination of Significance of Residual Effects for Marine Commercial Use 24.0 Outdoor Recreation 24.6 Future Conditions with the Project – Potential Project-related Effects 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2.6 Current Use of Land and Resources for Traditional Purposes, Future Conditions with the Project – Potential Project-related Effects 32.2.7 Current Use of Land and Resources for Traditional Purposes, Mitigation Measures Current Use of Land and Resources for Traditional Purposes, Characterisation of Residual Effects and Context
TFN-16.6	Concerned that fish are being redirected away from Canoe Passage and that this impact will increase with increased container ships at RBT2. Concerned that Canoe Pass is getting closed off because of the current terminal configuration	27-Nov-2013, Community Meeting	**27-Nov-2013, Meeting:** Committed to follow-up with Tsawwassen First Nation in regards to this concern. **15-Jan-2014, Letter from the VFPA:** A review of historical and recent air photos, in addition to modelling of sediment deposition at Roberts Bank (including Canoe Passage) is underway. Historic Canoe Passage discharge channel locations and sediment distribution	**Addressed in EIS Appendix 7.2-B (#49):** Field studies, air photo review, and modelling of sediment deposition at Roberts Bank (including Canoe Passage) were undertaken during the Project assessment, as described in the EIS. A Canoe Passage discharge channel location and sediment distribution (e.g., bar formation or build-up of sand) were modelled to assess variation pre and post-terminal construction. Potential changes associated with the configuration of RBT2 were assessed in relation to Roberts Bank, including the Canoe Passage discharge channel. Project-related changes to coastal geomorphological processes on Roberts Bank are predicted to be associated with the terminal footprint. However, the Project is not anticipated to alter sediment dynamics or water movement in and around the mouth of	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 9.5 Coastal Geomorphology 9.5.6 Existing Conditions 9.5.8 Future Conditions with the Project Table 9.5-6 Predicted Morphological Changes from the Project Footprint

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	and corresponding build-up of sand.		(e.g., bar formation or build-up of sand) will be documented to assess natural variation pre- and post-terminal construction, and potential changes as a result of the proposed terminal configuration will be assessed. Fish and fish habitat suitability studies are currently underway to assess current fish distribution and abundance, and potential changes in fish presence as a result of the proposed Project will be assessed. Potential changes resulting from the Project during both construction and operation phases will be included in the assessment. **01-Apr-2015, Letter from the VFPA:** Provided Tsawwassen First Nation with an advance copy of the EIS, which included EIS Appendix 7.2-B. **12-Sep-2016, Workshop:** The VFPA held an issues workshop with Tsawwassen First Nation on coastal geomorphology. An expert on coastal geomorphology stated that he can't guarantee that Canoe Passage won't be affected by the Project, but the understanding he's come to is that the effect doesn't extend as far as Canoe Passage. Noted the observation that since 1949 the channel hasn't been anywhere near the Project is correct.	the Fraser River. Changes are anticipated around the terminal and within the intertidal zone shoreward of the terminal. The effects of these changes on VCs are considered in the EIS.	Figure 9.5-35 Approximate Spatial Extent of Potential Changes Associated with the Project Footprint
TFN-16.7	Asked whether there has been consideration of the timing of in-water construction activities to avoid highs in the cycles. Suggested that construction not begin on a four-year-high in the context of sockeye runs.	19-Jul-2016, Issues Workshop - Musqueam First Nation / Tsawwassen First Nation #1	**19-Jul-2016, Workshop:** Stated that the juvenile salmon timing window (enforced by DFO) prevents project works and activities from occurring between March 1 and August 15 to protect juvenile outmigration and rearing. That's been written into the EIS and construction schedule.	**Addressed in EIS Section 17.0:** Mitigation for Marine Biophysical VCs summarises that Project construction phase avoidance measures include fisheries-sensitive windows established by DFO, which have been incorporated into the preliminary construction scheduled, as described in EIS Section 4.3.1 Project Schedule, Construction Phase. For example, aligning construction activities to avoid fisheries-sensitive windows for juvenile Pacific salmon from March 1 to August 15, above -5.0 m CD.	**EIS** 17.0 Mitigation for Marine Biophysical VCs Table 17-1 Measure to Avoid Potential Project-related Productivity Losses
TFN-16.8	Asked whether eulachon are captured in the assessment. Asked why the Project is expected to have no measurable effect on eulachon in Canoe Passage. Concerned that even small effects could impact the wellbeing of eulachon. Stated that any natural resource that people in	07-Oct-2014, Preliminary EIS Workshop #1 26-Nov-2014, Health & Aboriginal Rights Workshop – Tsawwassen First Nation 12-Sep-2016, Issues Workshop – Musqueam	**07-Oct-2014, Workshop:** Provided information about how eulachon are considered in the assessment. **26-Nov-2014, Workshop:** Committed to following-up on that question about why the Project determined no impact to eulachon in Canoe Passage. **01-Apr-2015, Letter from the VFPA:** Provided Tsawwassen First Nation with an advance copy of the EIS, which included EIS Appendix 7.2-B.	**Addressed in EIS Section 13.0:** Discussion regarding sub-component selection relative to species of importance to Indigenous groups, including eulachon, is captured in EIS Section 13.0. **Addressed in response to AIR-12.04.15-09:** The VFPA's response to AIR-12.04.15-09 outlines in detail the selection process for VCs, sub-components, and representative species and rationale for selection. Discussion of how sockeye, sturgeon, and eulachon were captured in the assessment (i.e., by proxy) is provided. **Addressed in EIS Section 13.0:** The EIS considered eulachon in EIS Section 13.0, where the species was assessed via the use of forage fish (specifically Pacific herring and surf smelt) as representative species.	**EIS** 13.0 Marine Fish 32.2.4.1 Tsawwassen First Nation **Information Requests** Response to Additional Information Request #9 (AIR 12.04.15-09 of CEAR Document #388) Response to Sufficiency Information Request #15 (IR5-15 of CEAR Document #1078)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	the Project area rely on (e.g. eulachon) should be a valued component. The changes in the availability of resources will be felt more keenly by local Aboriginal populations than will the incremental economic benefit spread across the country.	First Nation / Tsawwassen First Nation #2	**12-Sep-2016, Workshop:** Responded that eulachon wasn't selected as a representative species in the biophysical sections, but in the Aboriginal rights and interests section, the relationship Tsawwassen First Nation has with eulachon was covered and it was captured. The ecosystem model looks at interactions with the Project in space and time. It was noted that the Aboriginal Rights and Interests section is EIS Section 32.0.	**Addressed in EIS Section 32.2.4.1:** The importance of eulachon to Tsawwassen First Nation is acknowledged in EIS Section 32.2.4.1. **Addressed in response to IR5-15:** In its response to IR5-15, the VFPA specifically discusses existing conditions related to eulachon and describes the status and management practices associated with the species. Rationale as to how eulachon were assessed via use of Pacific herring and surf smelt as representative species, as well as similarities between species as they pertain to existing conditions (e.g., life history and habitat requirements), the mechanisms through which the Project may affect eulachon, as well as effectiveness of mitigation, are presented in the VFPA's response to AIR-12.04.15-09, including Appendix AIR9-A Table 2; and in IR5-15 response. Potential effects on eulachon (as represented by Pacific herring and surf smelt) are assessed as minor, based on the low potential of eulachon to interact with the Project during terminal construction (adult eulachon presence in the LAA has not been confirmed, and eulachon larvae rear in the Strait of Georgia outside LAA boundaries). With implementation of mitigation measures (including adherence to the crab fisheries sensitive window and implementation of Construction Environmental Management Plans), no loss in eulachon productivity is anticipated. **Additional information provided by the VPFA:** The VFPA acknowledges the importance of eulachon to Indigenous groups and has worked to support eulachon habitat through its Habitat Enhancement Program (HEP). In 2014, HEP provided funding to Pacific Salmon Foundation to support a Fraser River Eulachon Habitat Utilization Survey. This survey involved capturing and tagging 300 eulachon to better understand habitat use as eulachon undergo physical changes prior to river entry and spawning and to gather information to support habitat rehabilitation and abundance recovery. In 2017, HEP provided funding to the Lower Fraser Fisheries Alliance to support an assessment and recovery project for eulachon in the Fraser River.	
TFN-16.9	Concerned that the Project area is used as a critical sockeye holding area before they begin their migration up the Fraser River. Noted the characteristics of the area are unique within TFN territory, and impacts to the area would not be easy to mitigate in a like-for-like swap scenario. Stated that adult sockeye are known to hold, from time to time, off the mouth of the Fraser in some years and could be more exposed to the project.	19-Jul-2016, Issues Workshop - Musqueam First Nation / Tsawwassen First Nation #1	**19-Jul-2016, Workshop:** Stated that with regard to looking at holding areas in the Fraser estuary, the VFPA concluded there to be no additional effects beyond what's documented in the EIS. The effects pathways that would affect holding sockeye (light, noise) are adequately captured in the EIS. The VFPA's understanding of holding areas is that the holding area is quite large and includes Point Roberts, Gibsons and the Gulf Islands. Roberts Bank comprises a small portion of this larger area. From that perspective there is limited potential in overlap in space for that to occur. It is noted that the information reviewed about holding areas didn't identify specific areas in which fish are holding, and the VFPA requests that Tsawwassen First Nation share any such information. The VFPA requested that Tsawwassen First Nation provide any more information on sockeye holding in specific areas if available.	**Addressed in EIS Section 13.0:** While there is evidence that adult sockeye pass through the estuary annually en route to the Fraser River to spawn, available information indicates that most stocks enter the Fraser River with little or no delay (i.e., perhaps one day); hence, any potential interaction between the Project and migrating or passing individual adult sockeye salmon would be limited to approximately several days per year. A potential exception is a portion of the late-run timing group, which typically holds in the outer estuary for several weeks prior to starting upriver migration; however, since 1995, large segments of the late-run sockeye have ceased their holding behaviour and entered the Fraser River three to six weeks earlier than historically observed. As noted in EIS Section 13.2.1, there is no scientific evidence that waters at or near Roberts Bank represent holding areas for adult sockeye. **Addressed in response to IR5-15:** In its response to IR5-15, the VFPA specifically discusses existing conditions related to sockeye and describes the status and management practices associated with the species. The IR response also further assesses potential effects of the project on Sockeye directly. As further described in the response to IR5-15, based on existing literature, there is no formally defined holding area within the Fraser River estuary for returning adult sockeye. It appears that the brackish layer or plume within which adult sockeye may hold can extend as far north as Gibsons Landing, as far west and south as the Gulf Islands (from Gabriola Island near Nanaimo to Saturna Island at Boundary Passage), and as far east at	**EIS** 13.0 Marine Fish 13.2.1 Sub-components **Information Requests** Response to Sufficiency Information Request #15 (IR5-15 of CEAR Document #1078)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				Point Roberts area. However, since 1995, sockeye holding behavior appears to have ceased.	
TFN-16.10	Concerned with impacts to juvenile salmonids from the Project and use of the ITP.	01-Sep-2016, Letter	**15-Sep-2016, Letter from the VFPA:** The VFPA determined that locating the terminal almost entirely in subtidal waters not only reduced impacts to valued environmental intertidal habitat but also minimised dredging requirements which further reduces environmental impacts on fish and fish habitat. **27-Jun-2017, Letter from the VFPA:** Stated that as a result of work undertaken over the past year to address concerns raised by Tsawwassen First Nation and other Indigenous groups related to Dungeness crabs and DAS, and to reduce potential environmental effects from the Project, the VFPA has determined that the ITP is no longer required as a temporary storage location to support project construction. The elimination of the ITP, along with other changes will result in a Project that will not require a DAS permit.	**Addressed in Package 3 Preamble in Support of Responses to IR3-25 to IR3-40:** For further information concerning this change, please see IR Package 3 Preamble in Support of Responses to IR3-25 to IR3-40. **Addressed in PCU:** As requested by the Review Panel, the VFPA submitted the PCU on June 12, 2018, providing: • Detailed revised Project description, including a revised construction schedule; • Revised Project interaction matrix; • Preliminary details pertaining to the management and timing of dredging activities and the discharge of sediment-laden water; and • Revised assessment of environmental effects as required by the Project modifications. PCU Sections 1.0 and 2.0 describe the changes to the EIS, including updates to specific construction activities, the construction schedule, and relevant Project Description figures and appendices. In PCU Section 3.0, changes or effects resulting from the construction updates on ICs and VCs are described. Overall, these changes to the EA resulting from construction updates can generally be summarised as follows: • Reductions in potential adverse changes or effects on ICs, biophysical VCs, social VCs, and Current Use; and • Increases in positive interactions with socio-economic VCs. These beneficial changes to ICs and VCs occur at the level of interactions or potential effects, and in most cases are slight changes, and thus do not affect the overall conclusions made in the EIS, including proposed mitigation, residual effect characterisations, significance determinations or cumulative effects, as applicable, with one exception. The only component predicted to have a change to residual effects is land and water use, with a reduction of a residual effect on access to Tsawwassen First Nation community lease lands from a measurable non-significant residual effect to a negligible residual effect, due to elimination of the ITP and associated activities.	**Information Request Package 3 Preamble in Support of Responses to IR3-25 to IR3-40 – General and Disposal at Sea-related PCU (CEAR Document #928)** **PCU**
TFN-16.11	Concerned that chum has been selected as one of the 25 focal species and not sockeye. Stated that in Section 16.2 of the EIS, the justification for not including all salmon species (particularly sockeye and pink) when assessing the potential project effects on Commercial, Recreational and Aboriginal fisheries is not defensible. Requested that as much data be used as possible to assess effects to sockeye salmon, noting the species has a four year cycle and it is	28-Oct-2014, Preliminary EIS Workshop #3 15-Jun-2015, Letter to the CEA Agency (CEAR Document #231) 19-Jul-2016, Issues Workshop – Musqueam First Nation / Tsawwassen First Nation #1 28-Oct-2016, Letter to Panel (CEAR	**28-Oct-2014, Workshop:** Explained the ecosystem system model and discussed drivers and chum. Stated that all species of salmon are important, but they are using two in particular (chum and Chinook) to understand the effects and to navigate the environmental assessment. **30-Sep-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."* The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Appendix 7.2-B (#78):** Potential Project-related effects on marine fish, including all five species of Pacific salmon, are considered in the EIS. Chum and Chinook salmon are evaluated as being representative of all Pacific salmon species, as they are the most estuarine-dependent species of salmon, and therefore most likely to be affected by the Project. A field sampling program for salmon was conducted at Roberts Bank in 2012 and 2013. While it is possible that 2012 to 2013 seasonal surveying for the Project did not capture all salmon species present at Roberts Bank, historical survey data add to the weight of evidence, suggesting a realistic representation of species composition and abundance at Roberts Bank. **Addressed in EIS Appendix 7.2-B (#107):** Sockeye salmon was not selected as a representative species within the Pacific salmon subcomponent, as studies indicate that juvenile sockeye salmon do not use the Roberts Bank area in high abundance, relative to chum and Chinook salmon (which have been selected as representative species in the assessment). Since chum and Chinook are the most estuarine-dependent species of salmon, the potential for Project-related interactions with these species is greatest. Results of the assessment based on these two species represent a more conservative approach, given the life histories and habitat use of chum and Chinook. Therefore, potential Project-related effects on sockeye salmon are considered within the assessment through the assessment on the subcomponent Pacific salmon, as represented by chum and Chinook.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 13.0 Marine Fish 13.2 Selection of Marine Fish Valued Component 13.2.1 Sub-components Table 13-6 Desktop and Field Studies Related to Marine Fish to Support the Assessment 16.0 Ongoing Productivity of Commercial, Recreational, and Aboriginal Fisheries 16.2.1 Sub-components 21.0 Marine Commercial Use 21.5.2 Existing Conditions, Aboriginal Commercial Fishing and Seafood Harvesting

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	important to include data from more than just a single peak year. Stated that the EIS guidelines required that particular attention be paid to the findings of the Cohen commission. Stated that while it may be appropriate to not have included Sockeye in the assessment of effects on marine fish and their habitats, Sockeye should be included in the assessment of effects on Commercial, Recreational and Aboriginal (CRA) fisheries. The same holds for the inappropriate exclusion of other CRA fisheries (e.g. Eulachon). Concerned with the selection of chum and not sockeye as a focal species. Commented that there are 40-50 times as many sockeye in the area, and the economic value of sockeye exceeds the value of all other species for previous 4 years combined. Concerned that if sockeye are not part of the biophysical assessment, they will not be assessed as part of the socio-economic assessment. Stated that Chinook and chum are selected as indicator species of the potential project on salmon. Stated that these species are not the preferred species of Tsawwassen, who rely more on sockeye, culturally and economically.	Document #650)	**19-Jul-2016, Workshop:** The VFPA held an issues workshop regarding salmon, and potential Project effects. The VFPA acknowledges the importance of sockeye, both culturally and ecologically. Stated that it would be impractical to characterise existing conditions and assess effects a on every species that may frequent the Roberts Bank area. Biophysical VCs, sub-component species or groups were chosen for their ability to represent other species that are similar in nature, occupy comparable types of habitats, serve similar ecological roles, or could otherwise be affected by the Project in an analogous way. Stated that the VFPA picked representative species that are most likely to interact with the Project and be potentially impacted to avoid underestimating the effect. Stated that chinook and chum were selected because they are the most estuarine dependent. The assessment of chinook and chum conservatively represent the other salmon species, and also steelhead and cutthroat trout. Stated that some of the information we collected and reviewed indicates that juvenile sockeye do not use Roberts Bank in high abundance, and they also transit through the estuary relatively quickly. A large proportion of sockeye also tends to migrate north. It is noted that the VFPA worked with Tsawwassen First Nation and Musqueam First Nation to try to understand economic aspects of fisheries, including sockeye. There is some information in the Marine Commercial Use (MCU) section around sockeye harvest trends and locations. Mapping was undertaken and meetings held to try to understand where some fisheries species are located that community members are involved in harvesting. The MCU section relied very heavily upon the Marine Fish section to understand how availability would affect the fishery. The VFPA's understanding is that there is a lot of sockeye fishing in Canoe Passage, but commercial salmon harvesting does not generally occur nearer to the Project area. A transiting boat could see effects, and this is reflected the approach we took with the economic component.	Sockeye salmon are considered in the assessment of marine commercial use as the primary species of salmon sought in the assessment area. The economic component of sockeye fishing is addressed in EIS Section 21.0. **Addressed in response to AIR-12.04.15-09:** As noted in the VFPA's response to AIR-12.04.15-09, Sockeye salmon are represented by Chinook and chum salmon for the following reasons (additional rationale is provided in AIR 12.04.15-09), including Appendix AIR9-A Table 2: • Like Chinook and chum salmon, sockeye is one of five Pacific salmon species that are anadromous, and rely on freshwater habitats within the Fraser River watershed for spawning and rearing. • Mechanisms affecting Cultus Lake sockeye productivity (i.e., injury/direct mortality, changes in the acoustic and light environment, and changes in habitat availability) and sockeye response to Project-related effects are the same as those for Chinook and chum salmon. • The use of Chinook and chum salmon to assess Project-related effects on Cultus Lake sockeye is considered appropriate, as Chinook and chum salmon are more likely to interact with the Project due to higher local abundance and dependence on juvenile rearing habitats within the LAA. Adult sockeye pass through the estuary (some through the Project's LAA) en route to Fraser River spawning locations (beyond LAA boundaries). Since 1995, upriver migration of this late-run group has occurred with no holding at the river mouth; there is no evidence that waters at or near Roberts Bank represent holding areas for Cultus Lake sockeye. Relative to other salmon species, Cultus Lake sockeye juveniles do not use Roberts Bank in high abundance, and primarily rear in nearshore areas of the Strait of Georgia and off the Gulf Islands. In its response to IR5-15, the VFPA specifically discusses existing conditions related to sockeye salmon and describes the status and management practices associated with the species. Rationale as to how sockeye salmon were assessed via use of Chinook and chum as representative species, as well as similarities between species as they pertain to existing conditions (e.g., life history and habitat requirements), the mechanisms through which the Project may affect sockeye, as well as effectiveness of mitigation, are presented in the VFPA's response to AIR-12.04.15-09, including Appendix AIR9-A Table 2; and in IR5-15 response.	**Information Requests** Response to Additional Information Request #9 (AIR-12.04.15-09 of CEAR Document #388) Response to Sufficiency Information Request #15 (IR5-15 of CEAR Document #1078)

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Requested that the proponent model the effects of the project on sockeye runs. Stated that in any year, the maximum number of Chinook that may be caught by Tsawwassen, under Final Agreement, is 625. The maximum number of Chum salmon is 2576. Sockeye catches may, in years of sufficient abundance, may be up to a maximum of 15226. Losses of chinook and chum may represent a lesser reduction in value than losses of sockeye.				

Table 17: Marine Invertebrates – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-17.1	Asked what the migratory patterns of crabs are and what sort of contaminants they pick up if they pass the port. Concerned with the unknown black material found inside crabs that have been harvested at Roberts Bank.	18-Nov-2013, Community Meeting 26-Nov-2014, Health & Aboriginal Rights Workshop – Tsawwassen First Nation	**18-Nov-2013, Meeting:** Recorded comment for consideration by Project team. **15-Jan-2014, Letter from the VFPA:** There have been some studies that have shown crabs are migratory and other studies that have shown they are not. As part of the EA, the VFPA is trying to determine the level of contaminants that crabs could be picking up at Roberts Bank. **26-Nov-2014, Workshop:** Referred to the collection of some black crab specimens for testing which occurred independently of the RBT2 assessment. VFPA representatives at the meeting did not know the status of the testing, but undertook to follow-up. **07-Aug-2014, Email from the VFPA:** Stated that the VFPA is undertaking related to black material observed in Dungeness crabs previously harvested from the Fraser River estuary. This black material has been noticed by Tsawwassen and Musqueam First Nation crabbers in DFO Fisheries Management Areas 28 and 29 and as such we are working with these communities in the collection of crabs for testing. **09-Jul-2015, Email from the VFPA:** Provided Tsawwassen First Nation with a memo detailing the results of black crab testing. The memo provided the conclusions of the study: • There is no evidence of coal contamination, based on the results of sensitive tissue chemistry analysis testing for PAHs, metals, and trace elements; • Consumption risks are acceptably low and pose no risk to human health; and • The underlying cause of the blackened shells is determined to be shell disease (a common condition due to bacterial infection of existing lesions/damage in the crab shells). **12-Apr-2018, Letter from the VFPA:** Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the following documents review: • IR 4-33 - Crab Hepatopancreas Additional Study Summary; and • IR4-34 - Black Crab Additional Studies Summary.	**Addressed in EIS Appendix 7.2-B (#74):** Potential Project-related effects on Dungeness crabs are described in the EIS. An Edible Shellfish Study was undertaken to quantify bivalve shellfish and Dungeness crab soft tissue contaminant concentrations. The results of this study are provided in the EIS in the marine invertebrates and human health sections. In late 2014, samples of crab were collected by Indigenous crab harvesters concerned about contamination, and the VFPA has submitted these for tissue testing for various substances of concern, including PAHs, metals, and fungus. Preliminary observational results indicate that the cause of black colouration of crabs is consistent with shell disease, and not likely related to contamination from coal dust (EIS Appendix 27-C, Section 4.76). The detailed results of laboratory tests will be shared with Indigenous groups when available. **Addressed in responses to IR4-34 and IR4-33:** Further information concerning the VFPA's investigations into 'blackened' crabs is provided in the VFPA's response to IR4-34. Tsawwassen First Nation, Musqueam First Nation, Penelakut Tribes, and Hwlitsum crab harvesters operating under licenses in DFO Fisheries Management Areas 28 and 29 were asked to retain trapped specimens of Dungeness crab displaying evidence of blackening. Collection kits, including instructions for handling, were provided to crab harvesters participating in the study. A total of 15 kits were distributed. Five legal-sized male crabs were collected from DFO Fisheries Management Area 29-7 at Roberts Bank in August 2014 by a participating Tsawwassen First Nation crab harvester. In summary, black lesions were observed on four of the five crabs collected by Indigenous harvesters. The black lesions were concluded to be consistent with chitinolytic shell disease, generically referred to as "shell disease", a condition common to crab and other crustaceans. This disease is caused by a bacterial or fungal infection of an area where the outer layer of the shell has been previously damaged. Shell disease has not been linked to contamination. The disease is not specific to the Roberts Bank area and is present across the Pacific Northwest, including Alaska and B.C. and in Atlantic Canada. In its response to IR4-33, the VFPA provided results of the study. In summary: A crab hepatopancreas study was conducted at Roberts Bank to determine the concentrations of contaminants of concern in crab hepatopancreas in the LAA. In June 2017, Dungeness crab were collected from five traps placed at each of the three study locations (15 traps total). Twelve adult male crabs were harvested from each of the three sites (36 crab total). Samples were submitted under chain of custody to analytical laboratories accredited by the Canadian Association for Laboratory Accreditation (CALA) for the analysis requested. The analysis was completed in August 2017. Collectively, the results of a statistical comparison across sites indicate that the average concentrations of PCBs, coal indicator elements, arsenic compounds, and PAHs measured in hepatopancreas from crab collected from the RBT2 and ITP sites are not statistically higher than those measured in crab from the Canoe Passage reference site. This suggests	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 12.0 Marine Invertebrates 12.4.1 Desktop and Field Studies Table 12-4 Marine Invertebrates Studies to Support the Assessment 12.5.3 Existing Conditions, Dungeness Crabs 12.6.2 Future Conditions with the Project, Negligible Effects 27.0 Human Health 27.6.4 Potential Effect # 3 – Adverse Health Effects due to Stress and Annoyance - Perceived Contamination Appendix 27-C Shellfish Harvesting Potential and Contaminant-related Consumption Risks at Roberts Bank **Information Requests** Response to Sufficiency Information Request #34 (IR4-34 of CEAR Document #946) **Memorandum Re: Summary Report – Roberts Bank Dungeness Crab Health Studies**

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.	that existing sediment and water quality in and around the existing terminal and proposed RBT2 terminal are not contributing to contaminant concentrations in crab hepatopancreas that are higher than levels found in crab hepatopancreas from the Canoe Passage reference site.	
TFN-17.2	Stated that the proposed Project location is the most productive crabbing area used by TFN members. Expressed concern about crab size, lack of recruitment, sealice and compromised crab health, decline in fisheries and seasonality of fishing limiting their access. Stated that any impacts to marine invertebrates, their habitat, or our opportunity to harvest marine invertebrates are of great concern to TFN. Stated that of particular concern is the area immediately adjacent to the deep-water shelf, which is where this project is proposed.	03-Dec-2012, Meeting 12-Dec-2012, Meeting with Crabber TEK	**03-Dec-2012, Meeting:** Stated that the VFPA would like to continue to learn more about Tsawwassen First Nation's crab fisheries and hope to do so at the upcoming meeting with crabbers on December 12, 2012. [The VFPA also met with Tsawwassen First Nation crabbers on September 10, 2012]. **12-Dec-2012, Meeting:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided Tsawwassen First Nation with an advance copy of the EIS, which included EIS Section 12.0.	**Addressed in EIS Section 12.0:** EIS Section 12.0 presents an effects assessment for marine invertebrates. During construction and operation, the Project is expected to result in a net decrease in marine invertebrate productivity, both before and after mitigation is implemented. Increases in productivity of infaunal and epifaunal invertebrate communities and decreases in productivity for bivalve shellfish, Dungeness crab and orange sea pens are predicted. Short-term productivity losses are due to direct mortality and losses of available habitat within the Project footprint. Productivity decreases can be partially mitigated through the implementation of environmental management plans, including crab salvages and transplanting of orange sea pens, and through the creation of eelgrass, intertidal marsh, mudflat and sandy gravel beach habitats. While the Project is predicted to cause losses of productivity of bivalve shellfish, Dungeness crabs and orange sea pens, the scale of change is minor in the context of natural variability and would not compromise the population integrity or ecological function. The assessment concludes there are no significant adverse residual effects from the Project to marine invertebrates. The Project is not expected to result in any incremental adverse cumulative effects to marine invertebrates. Addressed in EIS Sections 12.0 and 21.0. EIS Sections 12.0 and 21.0 together present a review of existing conditions related to crab health and fisheries. As noted in EIS Section 21.0, potential Project effects on marine commercial use include potential displacement of commercial crab harvesting during construction and operation, resulting in a change of harvesting area, total harvest and revenue, due to the Project footprint and the proposed expansion of the area closed to commercial crabbing the Project is expected to result in a residual effect of changes to seafood harvesting area, harvest and revenue. The residual effect is determined to be not significant, as Dungeness crab are known to move substantial distances to baited traps, and harvest activity can be moved to another open area. Other planned or reasonably foreseeable projects and activities would also displace crab harvesting, and this effect would combine with that of the Project to result in an incremental cumulative effect on commercial crab fishing. This adverse incremental cumulative effect is determined to be not significant. **Addressed in EIS Appendix 7.2-B (#165):** The assessment of Current Use includes evaluation of potential effects to crab harvesting related to changes in access. The assessment concludes that after the implementation mitigation, a negligible residual effect is anticipated. A determination of significance is not made on negligible residual effects, as the effect is not measurable or detectable.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 12.0 Marine Invertebrates 21.0 Marine Commercial Use

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information

TFN-17.3	Concerned with potential impacts to crabs, crabbers, crab habitat and preferred crab harvesting areas from use of the ITP.
	Concerned that ITP site is in productive crab habitat.
	Concerned that mitigation of impacts to crab habitat as a result of the ITP won't be satisfactory.
	Stated that the impacts on crabs will be disastrous and the Project will wreck TFN member livelihoods.
	Asked if the VFPA has done a study on the impact of the ITP on crabs.
	Requested that the VFPA provide ITP-specific crab information in the EIS.
	Asked what the effect of using the ITP will be, given the length of time and intensity of use would be greater than for DP3 (since RBT2 is a larger project and situated in deeper water).
	Stated that the gain in area available to TFN's food, social, ceremonial (FSC) crab fishery from the expanded Navigational Closures Area (NCA) comes at the expense of high quality habitat that will be lost to the footprint of RBT2 and the ITP. A large proportion of the RBT2 and ITP footprints are within the optimal water depths for crab fishing and these areas will not be available for fishing due to project development. (LGL Crab Study)
		12-Feb-2015, Meeting
		03-Mar-2015, Meeting

		01-Sep-2016, Letter
		12-Sep-2016, Issues Workshop – Musqueam First Nation / Tsawwassen First Nation #2
		12-Jul-2017, Letter to the CEA Agency (CEAR Document #997)
			12-Feb-2015, Meeting:
			Noted that potential effects to crabs will be described in the EIS.
			03-Mar-2015, Meeting:
			The VFPA and Tsawwassen First Nation met to specifically discuss concerns related to the ITP. The VFPA looked at the impacts of the depositing of sand to Dungeness crab in the context of the whole Project area, not a specific site. The VFPA looked at it from an ecosystem perspective, considering ongoing productivity analysis, dredging and the impact on crabs, and did an analysis of activities around the ITP.
			The VFPA does have data and understands that it is important in terms of productivity; the VFPA has the information needed to make that assessment.
			It is noted that Tsawwassen First Nation was involved in planning and studies undertaken related to the ITP during DP3; there are several years of baseline information and displacement and placement of sand were assessed. There are specific transects from the ITP area. The VFPA undertakes to take back the request to separate out ITP-specific information from the EIS.
			18-Mar-2015, Meeting:
			The VFPA called Tsawwassen First Nation to provide information regarding the Gravid Crab survey, and delays related to weather. Tsawwassen First Nation advised that regardless of the Gravid Crab Survey, concerns regarding impacts to crabs at the ITP remain.
			01-Apr-2015, Letter from the VFPA:
			Provided a copy of the EIS, which described potential Project-related effects on Dungeness crabs.
			05-May-2015, Meeting:
			The VFPA and Tsawwassen First Nation met. ITP-specific crab information in the EIS was separated out for Tsawwassen First Nation and further discussed Tsawwassen First Nation's concerns related to the ITP.
			19-Jul-2016, Workshop:
			The VFPA stated that alternatives to using the ITP are being looked into and considered seriously. The VFPA expects being able to provide updates in the next few months.
			12-Sep-2016, Workshop:
			The VFPA stated that the Project team is still looking into alternatives to the ITP.
				Addressed in responses to IR3-24 to IR3-40:
				For further information concerning this change, see Information Request Package 3 Preamble in Support of Responses to IR3-25 to IR3-40.
				Addressed in PCU:
				As requested by the Review Panel, the VFPA submitted the PCU on June 12, 2018, providing:
				• Detailed revised Project description, including a revised construction schedule;
				• Revised Project interaction matrix;
				• Preliminary details pertaining to the management and timing of dredging activities and the discharge of sediment-laden water; and
				• Revised assessment of environmental effects as required by the Project modifications.
				PCU Sections 1.0 and 2.0 describe the changes to the EIS, including updates to specific construction activities, the construction schedule, and relevant Project Description figures and appendices. In PCU Section 3.0, changes or effects resulting from the construction updates on ICs and VCs are described. Overall, these changes to the EA resulting from construction updates can generally be summarised as follows:
				• Reductions in potential adverse changes or effects on ICs, biophysical VCs, social VCs, and Current Use; and
				• Increases in positive interactions with socio-economic VCs.
				These beneficial changes to ICs and VCs occur at the level of interactions or potential effects, and in most cases are slight changes, and thus do not affect the overall conclusions made in the EIS, including proposed mitigation, residual effect characterisations, significance determinations or cumulative effects, as applicable, with one exception. The only component predicted to have a change to residual effects is land and water use, with a reduction of a residual effect on access to Tsawwassen First Nation community lease lands from a measurable non-significant residual effect to a negligible residual effect, due to elimination of the ITP and associated activities.
				Additional information provided by the VFPA:
				As discussed in EIS Section 21.8.1, other sections of the EIS describe mitigation measures that are relevant to the assessment of effects on seafood harvesting area use and displacement. These include mitigation measures to address biophysical effects on marine invertebrates through avoidance and reduction of potential effects, as outlined in the EIS, and are summarised below:
				• Specific modifications to Project component locations and designs that will reduce potential effects to crabs, including the following:
				  ○ Placement of terminal in subtidal waters (EIS Section 12.7.1.1); and
				  ○ Reduced footprint of causeway widening (EIS Section 12.7.1.1);
				• Implementation of construction and operation environmental management plans related to the following:
				  ○ Construction work windows (EIS Section 12.7.1.2) and crab salvages around key crab life cycle windows and to relocate gravid female crabs (EIS Section 33.3.12);
				  ○ Water quality and sediment management (EIS Section 12.21.24); and

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			15-Sep-2016, Letter from the VFPA: The VFPA determined that locating the terminal almost entirely in subtidal waters not only reduced impacts to valued environmental intertidal habitat but also minimised dredging requirements which further reduces environmental impacts on fish and fish habitat. Given the greater impacts of the conceptual design shown in the 2004 MOA, a return to that design would be regrettable—and we do not take your letter to be suggesting such a regression. **27-Jun-2017, Letter from the VFPA:** Stated that as a result of work undertaken over the past year to address concerns raised by Tsawwassen First Nation and other Indigenous groups related to Dungeness crabs and DAS, and to reduce potential environmental effects from the Project, the VFPA has determined that the ITP is no longer required as a temporary storage location to support project construction. The elimination of the ITP, along with other changes will result in a Project that will not require a DAS permit.	○ Communications to include information about the timing and area of proposed construction and operational navigational closure expansion for commercial and recreational crab harvesting, and information about access restrictions and procedures for maintenance of safety commercial, recreational, and Indigenous crab harvesting activity (EIS Section 33.3.16); and • Offsetting effects by the creating habitat, including eelgrass, intertidal marsh, mudflat, and sandy gravel beach to mitigate adverse effects to the productivity of crab populations and associated crab fisheries (including commercial, recreational, and Indigenous) (EIS Section 17.5). **Addressed in response to IR10-07:** The VFPA's response to IR10-07, as requested by the Review Panel, provides additional clarity concerning the economic implications of any permanent or temporary displacement.	
TFN-17.4	Stated that in Section 12.6.2 and 12.6.3 of the EIS, more justification/ explanation is required for the use of the scale of negligible (0-5%), minor (6-30%, and moderate (31-60%) used to evaluate changes in invertebrate productivity (effect rating). Are these intended to equate to magnitude (it is not clear). Is it appropriate to use the same scale for all invertebrates? For example, a 50% decrease in productivity of Dungeness crab might be considered significant (or high magnitude?) whereas a 50% decrease in productivity of bivalves might not be. How does the scale of change then relate to significance of effects? Note that both 31-60 and 31-65 are used in the EIS for the moderate level.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #231)	**30-Sep-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Agency has requested additional information on this item in its letter of July 31, 2015 to [the VFPA] (page 3, #7)."*	**Addressed in response to IR-7.31.15-07:** Provides a discussion of: • Rationale for the application of the common classification system (of negligible, minor, moderate, or high) to describe productivity results from the Roberts Bank ecosystem model and other lines of evidence; • How productivity ranges relate to natural ecosystem variability and how ranges were determined; and • How the definition of magnitude (of effects) ratings relates to the definition of changes in productivity.	**EIS** 12.0 Marine Invertebrates 12.6.2 Negligible Effects 12.6.3 Potential Effect – Changes in Productivity **Information Requests** Response to Information Request #7 (IR-7.31.15-07 of CEAR Document #314)
TFN-17.5	Stated that for effects on the Dungeness crab sub-component (EIS Section 12.6.3.3), the EIS includes the statement "because construction activities were not incorporated into the ecosystem model, associated effects are deemed underestimated in the model." Stated that there needs to be further explanation of how the effected was deemed to be minor if the construction	15-Jun-2015, Letter to the CEA Agency (CEAR Document #231)	**30-Sep-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to [the VFPA's] methodology to inform its sufficiency review."*	**Additional information provided by the VFPA:** **Addressed in CEAR Document #547:** As is noted in the VFPA's response to preliminary questions from DFO and NRC in 2015 (see reference to the right): the RBT2 construction phase may result in changes to the environment. However, such potential changes are expected to be of short duration, localised, and many are expected to be either fully or partially mitigated. The primary objective of using the RB model was to evaluate potential changes in ecosystem productivity resulting from the Project (i.e., permanent loss of habitat and footprint-associated changes to coastal processes). The RB model was not intended to evaluate shorter-term effects from construction activities, and the inclusion of such activities	**EIS** 12.0 Marine Invertebrates 12.6.3.3. Changes in Productivity of Dungeness Crabs **CEAR Document #547 from the VFPA to the Review Panel Re: Answers to Preliminary Technical Questions Submitted During the Completeness Phase from DFO, Natural Resources Canada, And Environment and**

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	effects were not included and why construction effects were not included.			would have been inconsistent with the primary objective. It is relevant to note that the RB model was one of several lines of evidence used to assess potential effects, and other lines of evidence were used to address potential effects from construction phase activities.	**Climate Change Canada, Concerning the Ecosystem Modelling to Support the Roberts Bank Terminal 2 Project Environmental Review**
TFN-17.6	Asked if magnitude in this table equivalent to the scale used in Section 12.6.2 and 3 / Table 12-13 (effect rating)? It would appear so but why then was magnitude not used throughout to be consistent?	15-Jun-2015, Letter to the CEA Agency (CEAR Document #231)	**30-Sep-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Agency has requested additional information regarding significance criteria in its letter of July 31, 2015 to [the VFPA] (page 3, #7)."*	**Addressed in response to IR-7.31.15-07:** Provides a discussion of: • Rationale for the application of the common classification system (of negligible, minor, moderate, or high) to describe productivity results from the Roberts Bank ecosystem model and other lines of evidence; • How productivity ranges relate to natural ecosystem variability and how ranges were determined; and • How the definition of magnitude (of effects) ratings relates to the definition of changes in productivity.	**Information Requests** Response to Information Request #7 (IR-7.31.15-07 of CEAR Document #314)
TFN-17.7	Stated that the overall study results suggest that over time, crab availability is not predicted to change because the population is large and migratory. Requested clarification as to whether or not the study results account for the increased pressure on crabs, as a result of this necessary change in harvesting by Tsawwassen and potentially for others that may be granted licenses to crab in the area. Stated that they are becoming more reliant on Dungeness Crab, as natural and anthropogenic change has reduced the availability of all species of Fraser River salmon. This changing reliance means that an impact assessment done under status quo conditions may not address concerns that will arise under future scenarios of resource use and dependency.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR10-26:** The VFPA's response to IR10-26, as requested by the Review Panel, discusses potential effects of the proposed Project on the reasonably foreseeable future Current Use activities that have been identified by Indigenous groups.	**Information Requests** Response to Sufficiency Information Request #26 (IR10-26)
TFN-17.8	Requested that the proponent provide assurances greater than "are expected" to the Tsawwassen First Nation that the expanded navigation will not affect their opportunity to harvest Dungeness Crab. If this is not the case then Tsawwassen First Nation needs to know how and when the proponent proposes to go about working with Tsawwassen First Nation on such mitigation plans.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR7-34:** As noted in the VFPA's response to IR7-34, mitigation measures currently undergoing consultation and evaluation include: • Crab Management Area re-selection opportunity for commercial harvesters; • Adjustment of proposed navigational closure area expansion with consideration of commercial harvesting during Project operation; • Adjustment of the proposed navigational closure area expansion with consideration of Indigenous harvesting during operation; • Navigational Limited Access Fishing Area (multi-user system during operation); • Financial compensation; and • Others as raised through consultation. The evaluation of additional mitigation measures is being informed by consultation with commercial crab harvesters (including the Area I Crab	**Information Requests** Response to Sufficiency Information Request #34 (IR7-34 of CEAR Document #1172)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				Fisherman Association), Indigenous groups, DFO, and may include other relevant regulatory agencies regarding their specific interests and concerns. Evaluation of technical and economic feasibility of the suggested measures is currently underway to inform this consultation. Technical feasibility considers the following: • Availability, applicability, and effectiveness of the specific technology; • Fit with local site characteristics, Project design, construction schedule; • Applicable regulatory frameworks; and • Whether implementation is within the VFPA's jurisdiction. Economic feasibility considers the: • Scope of the Project design (Project re-design not required); • Construction schedule (Project construction delay not required); and • Total cost of implementation of each measure during construction and/or operation. In addition, the VFPA's response to IR10-07 as requested by the Review Panel provided additional discussion on potential economic implications of displacement in terms of access to resources.	
TFN-17.9	Stated that it is unknown if the proposed sea pen transplanting effort will be successful. Requested that the proponent describe the environmental outcome of a scenario in which the translocation is unsuccessful and the local population of sea pens becomes depleted or extirpated. (LGL Crab Study).	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information. **07-Feb-2018, Letter from the VFPA:** Starting in 2014, the Project team conducted a pilot study to test a method for transplanting orange sea pens, which involved transplant of 1,200 orange sea pens to three sites within the LAA for the Project. See attached a report titled Orange Sea Pen Transplant Pilot and Monitoring Program. The results of the study show that the pilot sea pen transplant was successful, with stable densities and evidence of recruitment at two of the three transplant sites. This report will be submitted to the Review Panel shortly with the VFPA's response to IR5-05.	**Addressed in responses to IR5-05 and IR5-06:** The VFPA's response to IR5-05, provides the Orange Sea Pen Transplant Pilot and Monitoring Program report (Appendix IR5-05-A). In summary, the pilot sea pen transplant was successful. Stable densities, and evidence of recruitment, at two of the three transplant sites demonstrate that not only can environmental conditions successfully be used to predict habitat suitability for orange sea pens across a larger study area, but also attests to the ecological viability of transplantation as a potential mitigation method. As noted in EIS Section 12.0, the VFPA stated that the proposed Project would result in a moderate reduction in Orange Sea Pen productivity, and that the level of confidence in this assessment was considered to be moderate. IR5-06 discusses the confidence in the rating. In summary, the moderate confidence ranking was rooted in four main points (each of which are described below): • The success of the orange sea pen pilot transplant and monitoring program (see IR5-05); • Remaining orange sea pen productivity with the Project (before mitigation) is considerable (45%) such that the population will persist at Roberts Bank; • Reproductive and larval biological characteristics of orange sea pens, which confer a high ability to replenish stocks; and • Coral transplants are common and successful elsewhere.	**Information Requests** Response to Sufficiency Information Request #05 (IR5-05 of CEAR Document #1145) Response to Sufficiency Information Request #06 (IR5-06 of CEAR Document #1145)
TFN-17.10	Stated that 43% of the proposed expanded Navigational Closure Area (NCA) area is located in deep water habitat (>50 meters) that TFN food, social, and ceremonial (FSC) fishermen cannot fish due to gear limitations, and 30% of the expanded NCA is located in habitat that is too shallow (< 2 meters) to be fished. Therefore, a total of 73% of the proposed expanded NCA	12-Jul-2017, Letter to the CEA Agency (CEAR Document #997)	The VFPA has reviewed this letter and provides the following additional information.	**Additional information provided by the VFPA:** The VFPA's response to IR10-07, as requested by the Review Panel, provides additional clarity concerning the economic implications of any permanent or temporary displacement. **Addressed in response to IR7-34:** As noted in the VFPA's response to IR7-34, mitigation measures currently undergoing consultation and evaluation include: • Crab Management Area re-selection opportunity;	**Information Requests** Responses to Sufficiency Information Request #34 (IR7-34 of CEAR Document #1172) Response to Sufficiency Information Request #07 (IR10-07)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	is either too deep or too shallow for crab fishing. (LGL Crab Study). Stated that similar to the current Navigational Closure Area (NCA), the expanded NCA will only provide temporary refuge from the commercial fishery as males move inside and outside the current NCA. (LGL Crab Study). Stated that overall, the study shows that there will be a 50% reduction in optimal (2-20 meter) food, social and ceremonial (FSC) crab fishing area, and a 20% reduction in accessible (2-50 meter) FSC crab fishing area due to the project. Therefore, the proposed configuration of the expanded Navigational Closure Area (NCA) does not appear to adequately offset the loss in FSC fishing opportunity and catch as more fishing area will be lost than gained. (LGL Crab Study)			• Adjustment of proposed navigational closure area expansion with consideration of commercial harvesting during Project operation; • Adjustment of the proposed navigational closure area expansion with consideration of Indigenous harvesting during operation; • Navigational Limited Access Fishing Area (multi-user system during operation); and • Financial compensation. The evaluation of additional mitigation measures is being informed by consultation with commercial crab harvesters (including the Area I Crab Fisherman Association), Indigenous groups, DFO, and may include other relevant regulatory agencies regarding their specific interests and concerns. Evaluation of technical and economic feasibility of the suggested measures is currently underway to inform this consultation. Technical feasibility considers the following: • Availability, applicability, and effectiveness of the specific technology; • Fit with local site characteristics, Project design, construction schedule; • Applicable regulatory frameworks; and • Whether implementation is within the VFPA's jurisdiction. Economic feasibility considers the following: • Scope of the Project design (Project re-design not required); • Construction schedule (Project construction delay not required); and • Total cost of implementation of each measure during construction and/or operation.	
TFN-17.11	Stated that the losses identified by the study represent a best case scenario for TFN. If the mitigation measures proposed by the EIS are less effective than predicted, then TFN's access to its food, social, and ceremonial (FSC) crab fishery will be reduced to an even greater degree than indicated above. (LGL Crab Study)	12-Jul-2017, Letter to the CEA Agency (CEAR Document #997)	The VFPA has reviewed this letter and provides the following additional information. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 33.5 with details on the proposed Follow-Up Program.	**Addressed in EIS Section 33.5:** Similar to the Adaptive Management Strategy for DP3, as described in EIS Section 33.5, the VFPA is committed to developing and implementing a Follow-up Program for the Project. The purpose of the Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project. To ensure the Program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the EIS. The Follow-up Program will include: • An evaluation of the adequacy of existing data to provide a benchmark against which to test Project-related effects; • A monitoring design drawing on the measurable parameters identified to be field-tested; • A methodological approach for using field-collected data to measure and verify the accuracy of the effects predicted in the EIS; • A reporting framework that defines frequency of reporting, distribution and feedback mechanisms; and • Details of the VFPA's approach to adaptive management for the Project through construction and operation. The Follow-up Program will be developed in consultation with federal agencies, including the CEA Agency, DFO, and Environment Canada. Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on	**EIS** 33.5 Follow-Up Program

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				the program and approving agencies have an opportunity to evaluate and approve the Program. Feedback from Indigenous groups regarding the draft Program will be sought through the VFPA's ongoing engagement initiatives.	
TFN-17.12	Concerned with the discrepancy between study findings which indicate bivalve shellfish are safe to eat, yet DFO maintains a permanent bivalve shellfish closure. Noted that TFN would like to harvest shellfish if it is safe to eat.	26-Nov-2014, Health & Aboriginal Rights Workshop – Tsawwassen First Nation	**26-Nov-2014, Workshop:** Recorded comment for consideration by Project team. The VFPA presented information on Project related health effects. Stated that DFO maintains permanent bivalve shellfish closure at Roberts and Sturgeon Banks, and Boundary Bay (DFO Area 29 in general) generalized sanitary shellfish closure. Stated that there are no potential direct adverse health effects predicted to result from exposure to contaminants in shellfish Stated that future changes with project, either during construction or operations, have no potential to increase the tissue concentrations of contaminants studied. Noted that potential indirect health effects, related to the perception that shellfish is contaminated, are assessed under the 'Stress and Annoyance' sub-component. **01-Apr-2015: Letter from the VFPA:** Provided a copy of the EIS, which included information on food safety associated with edible bivalve consumption in Appendix 7.2-B.	**Addressed in EIS Appendix 7.2-B (#136):** Food safety associated with edible bivalve consumption requires that the bivalve tissues be safe based on all three of the following: • General absence of toxins produced by harmful algal blooms that can result in paralytic shellfish poisoning (PSP) and amnesic shellfish poisoning (ASP); • General absence of microorganisms in the shellfish tissues (viruses, bacteria, protistans) that are potentially pathogenic to humans; and • Presence of trace elements (e.g., cadmium) and chemical contaminants such as petroleum hydrocarbon residues at levels lower than thresholds of unacceptable health risk if consumed by humans. The shellfish consumption risk assessment directly addresses the third of these factors. In contrast, the DFO Area 29 sanitary shellfish closure is driven mostly by concerns associated with the second of these factors. DFO is the proper authority to determine the validity of shellfish closures. **Addressed in response to IR13-22:** The VFPA's forthcoming response to IR13-22 will further discuss potential Project effects on the quality and availability of preferred resources.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 27.0 Human Health Appendix 27-C Shellfish Harvesting Potential and Contaminant-related Consumption Risks at Roberts Bank: 5.1 Human Health Risk Assessment (HHRA), Context **Information Requests** Responses to Sufficiency Information Request #22 (IR13-22)
TFN-17.13	Concerned with the effectiveness of crab salvage as a mitigation measure. • Interested in future discussions specific to related mitigation measures. • Question asking for an estimate of how many crabs will need to be relocated. • Concerned that it doesn't sound like work has been done to tag and track crabs to see where they would end up if relocated. • Suggested to bait outside the Project area to draw crabs away as opposed to baiting within the Project area and relocating them; • Concerned that moving them may put more stress on another crab area. • Noted that crabs can migrate fast and what may seem like a far distance could be a short distance for a crab.	19-Jul-2016, Issues Workshop - Musqueam First Nation / Tsawwassen First Nation #1 12-Sep-2016, Issues Workshop – Musqueam First Nation / Tsawwassen First Nation #2	**19-Jul-2016, Workshop:** Responded that crab salvage was used as a mitigation measure in DP3, and the feedback indicated that it was successful. Crab salvage involves laying traps down—in the past we worked with Tsawwassen First Nation to trap crabs and move them to outside the Project footprint and away from construction activities, and move them to another area within their home range, to avoid direct mortality. Salvage and the use of timing windows are the primary direct mitigation measures for crabs, but other pieces are built in through offsetting and habitat creation as well, for e.g., eelgrass transplants are thought to also benefit crabs. **12-Sep-2016, Workshop:** Stated that the VFPA is committed to the plan in consultation with First Nations and regulators, including the specific details of how many traps would be laid own and for how long. The idea is to salvage within the area for construction and move them elsewhere on Roberts Bank.	**Additional information provided by the VFPA:** To ensure their alignment with all required project permits, any conditions of approvals, final designs, finalised construction or operation approaches and site-specific considerations, the Project's Environment Management Plans are necessarily developed and finalised nearer to the start of the construction and operation phases. The VFPA is committed to soliciting feedback from Indigenous groups concerning the draft environmental management plans, including on the Marine Species Salvage Plan. The VFPA will seek opportunities to work with Indigenous groups in the salvage plan implementation.	

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	• Suggested to tag crabs to determine where they are travelling. Suggested to have an alternative plan should it not be effective.		The mitigation plans are evolving, and the VFPA looks forward to discussions with Tsawwassen First Nation about these plans. **12-Apr-2018, Letter from the VFPA:** Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the RBT2 Crab Mitigation Summary Overview, which detailed the following: • Mitigation measures to avoid or reduce effects to crab as outlined in the EIS; and • Additional crab harvesting related mitigation measure suggestions under review. Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.		

Table 18: Marine Mammals – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-18.1	Stated that as sentinels of the health of the Salish Sea and as animals with important social and ceremonial values to TFN, TFN is very concerned about any adverse effects of the Proposed Project on marine mammals. Concerned that even if the residual effect to the Southern Resident Killer Whale (SRKW) population is ranked "not significant", a small impact from the Project could be the tipping point that leads to population collapse, given its already small numbers. Suggested identifying the threshold under which the population can sustain impacts should be important. Stated that SRKW are important to TFN for cultural purposes. Stated that Kinder Morgan EA concludes that there will be a cumulative effect on killer whales in the southern Gulf Islands due to noise, and TFN can only assume the VFPA will have the same effect. Interested in mitigation measures for SRKW. Suggested that an increase in tug escorts may help. Stated that the cumulative impacts of underwater noise on Killer Whale will be significant. Stated that the Construction and Operations Environment Management Plans described by the EIS are meant to mitigate against the effects of noise, and the possibility of vessel strikes. It is not known how successful these plans will be. Requested further description on how the project might be modified in the event that the Environment Management Plans are found to be insufficiently protecting Killer Whales from harm. See also DFO IR-67 & 68 (12 Oct 2016).	16-Oct-2013, Letter to the CEA Agency 26-Nov-2014, Health & Aboriginal Rights Workshop – Tsawwassen First Nation 21-Jul-2015, Meeting 28-Oct-2016, Letter to Panel (CEAR Document #650)	**26-Nov-2014, Workshop:** Stated that the presentation on marine mammals given at Workshop #3 (28-Oct-2014) provided additional information on the preliminary determination of significance for SRKW. The presentation included the following information: "Potential Project effects on marine mammals include: • Underwater noise resulting in behavioural effects or difficulty hearing/finding food • Adverse health effects from consumption of contaminants resulting from sediment re-suspension • Potential vessel strikes Anticipated construction related effects expected to be low following mitigation No residual effects during operations Cumulative effects for future projects / activities – analyses ongoing" **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **21-Jul-2015, Meeting:** Explained that the route that will be used is the same as the route studied on other projects. Added that effects related to the Project are expected to be similar to what is currently experienced. **12-Sep-2017, Meeting:** The VFPA met with Tsawwassen First Nation and discussed SRKW and the Enhancing Cetacean Habitat and Observation (ECHO) Program. The VFPA explained that the Port initiated a program to slow down vessels. DFO and TC are also working on initiatives to help SRKW.	**Addressed in EIS Appendix 7.2-B (#92):** Project-related adverse residual effects to SRKW (and all toothed whales) are expected to be not significant. The Project contribution of effects above existing conditions is very small and is not anticipated to adversely affect individuals or affect critical habitat features (acoustic environment, the availability of prey, and water and sediment quality) when needed by SRKW for their life functions of foraging, mating, resting, or socialising. Destruction of SRKW critical habitat from Project construction and operation is not anticipated, and the Project will not limit the survival or recovery of SRKW. Cumulative effects to baleen whales and seals and sea lions are expected to be not significant. However, due to their Endangered status and lack of recovery of the population, the VFPA has assumed that past activities and projects, including those described in the recovery strategy issued by DFO, have had a significant adverse effect on SRKW. Therefore, the Project, in combination with past projects and activities that have been carried out, and certain and reasonably foreseeable projects that will be carried out, will result in a continued significant cumulative effect to SRKW. **Addressed in response to IR4-10:** As noted in the VFPA's response to IR4-10, in 2014, the VFPA-led ECHO Program is a collaborative initiative aimed at better understanding and managing the impact of shipping activities on at-risk whales throughout the southern coast of B.C. The VFPA-led ECHO Program engages and involves key regional interested parties to maximise program success and help ensure that mitigation and management measures developed through the program are informed by social, cultural, economic, and environmental sustainability interests. The ECHO Program is guided by the advice and input of an advisory working group, and supported by a federal government advisory committee and associated technical committees. Through engagement and consultation with stakeholders, including Indigenous individuals, the ECHO Program has initiated or supported short-term projects, scientific studies, and educational initiatives to fill knowledge gaps necessary to inform the development of credible, science-based threat reduction solutions and management options to reduce cumulative effects of shipping to at-risk whales in the region. Further information about ECHO Program can be found at: https://www.portvancouver.com/environment/water-land-wildlife/echo-program/ **Addressed in EIS Section 14.0:** As noted in EIS Section 14.0, cumulative effects to baleen whales and seals and sea lions are expected to be not significant. However, due to their Endangered status and lack of recovery of the population, the VFPA has assumed that past activities and projects, including those described in the recovery strategy issued by DFO, have had a significant adverse effect on SRKW. Therefore, the Project, in combination with past projects and activities that have been carried out, and certain and reasonably foreseeable projects that will be carried out, will result in a continued significant cumulative effect to SRKW. **Addressed in response to IR5-50:** The VFPA's response to IR5-50, as requested by the Review Panel, describes the measures that are within the Proponent's control and could be used to mitigate the potential effects of underwater noise on marine mammals during the proposed Project operation. **Further information provided by the VFPA:** The VPFA welcomes Indigenous groups' input concerning potential project mitigation measures and encourages additional suggestions.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 14.0 Marine Mammals 14.9 Determination of Significance of Residual Adverse Effects 14.10.4 Significance Determination for Residual Adverse Cumulative Effects **Information Requests** Response to Sufficiency Information Request #10 (IR4-10 of CEAR Document #1051) Response to Sufficiency Information Request #50 (IR5-50 of CEAR Document #1172)

Tsawwassen First Nation

Table 19: Marine Shipping Addendum

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-19.1	Stated that the context of the Tsawwassen First Nation Final Agreement needs to be better presented in the current use section for TFN. Stated that rights are not site specific and this needs to be emphasized in the harvesting section.	21-Jul-2015, Meeting	**21-Jul-2015, Meeting:** Committed to follow up regarding appropriate wording for incorporation into the MSA. **11-Sep-2015, Phone Call:** Tsawwassen First Nation indicated that the following would be language they would want to see in the marine shipping Current Use document: "Current protocols are in no way reflective of where the rights exist or may be exercised in the future". **09-Nov-2015, Letter from the VFPA:** Provided a copy of the MSA, which included Section 9.5.4.13 Tsawwassen First Nation.	**Addressed in MSA Section 9.5.4.13:** Wording was incorporated into the MSA at Tsawwassen First Nation 's request. The following language was incorporated into MSA Section 9.5.4.13: *"Tsawwassen First Nation has advised that their treaty rights are not site-specific within these areas, and that the location of Current Use activities (or lack of Current Use activities) are in no way reflective of where the treaty rights exist or may be exercised in the future (Tsawwassen First Nation 2015a). Tsawwassen First Nation has also advised that it is currently developing marine resource harvesting plans for areas within the Marine Shipping Area (e.g., Boundary Bay) (Tsawwassen First Nation 2015b)."*	**MSA** 9.5.4.13 Tsawwassen First Nation
TFN-19.2	Stated that marine shipping should be included in environmental assessment. Concerned that issues associated with marine shipping will not be addressed given the guidance that marine shipping will not be considered in the Panel's decision. Asked why the CEA Agency considers the VFPA's navigational jurisdiction a factor in the decision when it wouldn't have a bearing on a private proponent.	16-Oct-2013, Letter to the CEA Agency 21-Jul-2015, Meeting	The VFPA has reviewed this letter and provides the following additional information. **21-Jul-2015, Meeting:** Stated that other First Nations have asked the same question, but the guidelines are quite specific in the intent. It is noted that questions related to the scope of the marine shipping study and where it fits into the panel process can be directed to the CEA Agency. Responded that the VFPA cannot comment on the CEA Agency process. The VFPA is involved in the review, but not in enforcement within the marine shipping area. The VFPA is unable to implement mitigations beyond its jurisdiction. The marine shipping report will be shared with the CEA Agency and Transport Canada. The appropriate authority or party will need to respond to issues raised in the report within their sphere of influence. **09-Nov-2015, Letter from the VFPA:** Provided a copy of the MSA, which included Appendix 5-B Aboriginal Groups Issues and Interests.	**Addressed in MSA Appendix 5-B (#17):** The VFPA advised the CEA Agency of this concern through MSA Appendix 5-B (#17). **Addressed in *Updated EIS Guidelines*:** On April 17, 2015, the CEA Agency issued *Updated EIS Guidelines* that included the addition of environmental effects of marine shipping associated with the Project, beyond the scope of the Project (VFPA jurisdiction) to the 12 nautical mile limit of Canada's territorial sea. As described in the Updated EISG: "Marine shipping associated with the Project that is beyond the care and control of the Port is not considered to be part of the Project for the purposes of the environmental assessment. As a result, the Minister will not make a decision under CEAA 2012 about whether that marine shipping associated with the Project is likely to cause significant adverse environmental effects, and it will not be subject to conditions issued to the proponent in any decision statement allowing the Project to proceed. However, marine shipping associated with the Project beyond the care and control of the proponent is within the jurisdiction of the federal government. The environmental assessment will act as a means for the federal government to collect information on the effects of increased marine shipping associated with the Project for use by programs or activities within federal jurisdiction."	**MSA** Appendix 5-B Aboriginal Groups Issues and Interests 11.0 Introduction ***Updated EIS Guidelines***

Tsawwassen First Nation

Table 20: Marine Vegetation – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-20.1	Stated that TFN is very concerned about potential impacts to the brackish marshes and eelgrass beds of the Delta.	16-Oct-2013, Letter to the CEA Agency	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 11.0:** EIS Section 11.0 assesses potential effects of the Project on marine vegetation and presents a characterisation of existing conditions. Overall, net productivity of marine vegetation is expected to increase with the Project, without mitigation, and would be further increased with the implementation of environmental management plans and the creation of habitat. The overall productivity increase is due to sheltering of the intertidal zone shoreward of the terminal, which would optimise physical conditions for marine vegetation. During Project construction and operation, changes in productivity of eelgrass, biofilm and biomat are predicted to be negligible (i.e., not measurable or detectable), while increases in productivity of intertidal marsh are expected. Productivity of rockweed, a macroalgae, is predicted to decrease during construction and operation. This decrease can be mitigated through the creation of on-site subtidal rock reef habitat. The Project is expected to temporarily influence community composition of biofilm during freshet from terminal footprint-related changes in salinity, but is expected to return to existing conditions outside of the annual freshet period. The assessment concludes there are no significant adverse residual effects from the Project to marine vegetation, as it would continue to maintain its existing ecological functions. The Project is not expected to result in any incremental adverse cumulative effects to marine vegetation. **Addressed in EIS Appendix 7.2-B (#201):** Onsite eelgrass habitat creation is proposed through transplanting in an area approximating 3 ha. Based on the review of previous habitat creation programs (e.g., DP3), eelgrass transplants are considered to be an effective means of increasing productivity of marine vegetation. The VFPA will implement a Follow-up Program, which will include monitoring to confirm that all offsetting measures meet intended objectives and function as designed. Monitoring will include methods and success measures to confirm that offsetting measures have been effective. The *Fisheries Act* Authorisation will require that functional objectives are met. **Additional information provided by the VFPA:** The VFPA has been working on the proposed Tsawwassen Eelgrass Project in consultation with Tsawwassen First Nation. This project is currently in the permitting and approvals stage, and would result in the conversion of lower-value subtidal areas into higher value eelgrass habitat. The total area of habitat enhancement is approximately four hectares.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 11.0 Marine Vegetation
TFN-20.2	Requested a detailed description of what biomat is. Commented that even though biofilm is a relatively new thing, TFN has a high level of concerned with impacts to biofilm.	08-Oct-2014, Preliminary EIS Workshop #2 26-Nov-2014, Health & Aboriginal Rights Workshop – Tsawwassen First Nation	**08-Oct-2014, Workshop:** Responded that there is quite a bit of biofilm and biomat in the inter-causeway area. Both of them are basically a matrix of sediment particles; biomat is more of a cyanobacteria, a green algae, whereas biofilm is comprised of primary producers, smaller photosynthesising microscopic organisms, which birds eat. Shared that the marine vegetation presentation will likely include a habitat map, showing the extent of biofilm and biomat, as well as present information about Project-related changes.	**Addressed in EIS Appendix 7.2-B (#65):** Biofilm, a thin dense layer of microscopic photosynthetic algae and bacteria, sediment and organic matter, is found within the upper intertidal zone and is an important food source for invertebrates, fish, and bird species (including migratory western sandpiper and dunlin). Biomat is described as microbial mat, which can take different forms and be composed of a variety of single and multi-cellular organisms, which for the purposes of the Marine Vegetation Effects Assessment, is defined as blue-green algae and associated diatoms. Biomat, located in the upper intertidal area of Roberts Bank, is a primary producer and is likely consumed by higher trophic levels. Biofilm, biomat, and intertidal marsh are considered in the effects assessment as sub-components of the marine vegetation VC. The existing conditions (including ecological function) for biomat and biofilm in the Project area and the potential effects of the	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 11.0 Marine Vegetation 11.5 Existing Conditions 11.5.4 Biomat 11.5.5 Biofilm 11.6. Future Conditions with the Project

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			28-Oct-2014, Workshop: Marine Vegetation VC (of which biomat is a sub-component) was a topic of discussion at this Preliminary EIS Workshop. **26-Nov-2014, Workshop:** Recorded comment for consideration by Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	Project on these marine vegetation sub-components, as well as on coastal birds, are described in the EIS. The assessment concludes that, overall, net productivity of marine vegetation is expected to increase with the Project, without mitigation, and would be further increased with the implementation of environmental management plans and the creation of habitat. During Project construction and operation, changes in the productivity of biofilm and biomat would be negligible (i.e., not measurable or detectable), while increases in the productivity of intertidal marsh are expected. The Project is expected to temporarily influence community composition of biofilm during freshet from terminal footprint-related changes in salinity. Biofilm community composition is expected to return to existing conditions outside of the annual freshet period. As described in the EIS, the temporary, reversible changes in the biofilm community assemblage from salinity changes during freshet are not predicted to affect shorebirds.	11.6.4 Potential Effect – Changes in Biofilm Assemblage Composition 15.0 Coastal Birds 15.7.2 Potential Effect – Changes in Productivity
TFN-20.3	Asked if there is any possibility that the diatoms that serve as the organism input for biofilm were introduced to the area by ballast water from vessels berthed at Deltaport.	28-Oct-2014, Preliminary EIS Workshop #3	**28-Oct-2014, Workshop:** Responded that it is very unlikely. The diatoms occur throughout the Strait of Georgia, and much is known about them, such as species and genus, what they look like, and their shape. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Section 11.5:** EIS Section 11.5 characterises the existing conditions of marine vegetation within the LAA, and describes the surrounding environment and factors influencing the Marine Vegetation VC. EIS Sections 11.5.4 and 11.5.5 discuss diatoms as constituents of biomat and biofilm.	**EIS** 11.0 Marine Vegetation 11.5 Existing Conditions 11.5.4 Biomat 11.5.5 Biofilm

Tsawwassen First Nation

Table 21: Marine Water Quality – Intermediate Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-21.1	Stated that TFN is very concerned about impacts to marine and sediment quality as they have direct linkages to our quality of life and opportunities to exercise Tsawwassen Rights. Concerned with the impact of this proposal on sedimentation on the foreshore of TFN's lands - lands already impacted by port and ferry causeway development	16-Oct-2013, Letter to the CEA Agency	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 9.5:** The Project layout and configuration have been modified to minimise the potential for a number of adverse changes to geomorphology during Project construction and operation. An example is locating the terminal almost entirely within the subtidal zone at Roberts Bank. Changes to coastal geomorphology are not expected from terminal development activities, but are related to the terminal footprint itself. The footprint would interact with tidal currents and wind-generated waves, resulting in localised alterations to sediment transport, sediment erosion and deposition, and freshwater and marine water flow exchange in the construction and operation phases. During causeway construction, drainage channels are expected to form on the intertidal flats adjacent to the causeway. This change would occur during construction only, and it is temporary and reversible. The VFPA would ensure the study and management of potential channel formation during the construction phase, and changes would be incorporated in detail design as required. Changes from the expansion of the tug basin include the conversion of local tidal flats to subtidal waters. Although the formation of additional tidal channels is not anticipated, a small increase in the size of an existing channel is likely. No incremental cumulative changes in coastal geomorphology are anticipated to result from the Project in combination with other projects and activities. **Addressed in EIS Section 9.6:** Changes to surficial geology and marine sediment during Project construction activities are expected to be minimal or undetectable relative to natural variability. Changes in sediment contaminant levels are not expected. The terminal footprint is predicted to alter tidal currents and interactions with Fraser River waters. Initially, it is predicted to cause seabed erosion and sediment deposition near the terminal. Subsequently, it is predicted to increase fine sediment deposition on portions of the tidal flat within the range of existing natural variability. No incremental cumulative changes in surficial geology and marine sediment quality are anticipated to result from the Project in combination with other projects and activities.	**EIS** 9.5 Coastal Geomorphology 9.6 Surficial Geology and Marine Sediment
TFN-21.2	Concerned about any discharges and wastes that result from the proposed project, and the implications of such for the environment and/or our people. Concerned with foreign species and invasive plants from increased international shipping traffic. Commented that improper handling of bilge water at the current port has been observed.	16-Oct-2013, Letter to the CEA Agency 18-Nov-2013, Community Meeting 27-Nov-2013, Community Meeting 14-Apr-2014, Community Meeting 17-Jun-2014, Technical	**18-Nov-2013, Meeting:** Recorded comment for consideration by the Project team. **27-Nov-2013, Meeting:** Committed to follow-up with Tsawwassen First Nation regarding this concern. **15-Jan-2014, Letter from the VFPA:** *"The Canada Food Inspection Agency (CFIA) is the primary federal agency covering inspections related to foreign species (invasive plants) arriving on imported containers.*	**Addressed in EIS Appendix 7.2-B (#100):** The VFPA was the first port in North America to prohibit in-port ballast water exchange without prior mid-ocean exchange, a practice which became the basis of government requirements now enforced by Transport Canada. To prevent the invasion of foreign species into local waters, international regulations, through the International Maritime Organization (IMO), are managed by Transport Canada. All commercial deep sea vessels are required to carry out a ballast water exchange prior to entering Canadian waters. This is done outside the exclusive economic zone of 200 nautical miles and in water deeper than 2,000 m. By requiring vessels to complete this ballast "flush" well outside Canadian waters, the aim is to prevent any foreign organisms from entering into the local ecosystem. The U.S. has similar requirements, and vessels arriving from the Puget Sound area need to forward the completed U.S. forms to Canadian authorities prior to entry into Canadian waters.	**EIS** 4.0 Project Description 4.4.2 Operation-phase Activities Appendix 7.2-B Aboriginal Groups Interests and Issues Table 9.7 Marine Water Quality 9.7.8 Future Conditions with the Project **MSA** Appendix 5-B Aboriginal Issues and Interests

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Asked which authority is responsible for controlling invasive species. Asked if invasive species could be flagged.	Working Group Meeting #4 21-Jul-2015, Meeting	*CFIA's objective is to inspect for invasive alien species. Depending on the nature of the inspection, they partner with the following federal agencies: Canada Border Services Agency (CBSA), Environment Canada and the Department of Fisheries and Oceans.* *In the instance of container shipping, CFIA is involved with inspections of the vessel, the contents of the container (with CBSA) and the exterior of the container itself. For example, CFIA will inspect the exterior of a container as it is being processed at the truck gate(s) of the marine terminal(s)."* **14-Apr-2014, Meeting:** Recorded comment for consideration by Project team. **17-Jun-2014, Working Group:** Responded that invasive species can be flagged. The VFPA will identify potential effects to a range of species (through the model) to understand what the offsetting needs are. If there is an increase in invasive species, measures could be undertaken to address this effect. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **21-Jul-2015, Meeting:** Recorded comment for consideration by Project team. **09-Nov-2015, Letter from the VFPA:** Provided a copy of the MSA, which included information on ballasting in Section 3.0 and Section 4.0.	Import containers are generally not opened at the terminal. Canada Border Services Agency inspects the contents of a percentage of import containers off-terminal in Richmond, and in the future will be done at the facility on Tsawwassen First Nation land currently being developed. All ships use rat guards on their mooring lines to ensure that rats and other rodents do not crawl up or down the mooring lines between the ship and the wharf. **Addressed in MSA Appendix 5-B (#33):** Information on ballasting is provided in Section 3.0 and Section 4.0. Transport Canada enforces Canadian regulations and international conventions implemented by Canada governing matters such as ballast water management. Since ballasting is not permitted within the marine shipping area, it is not assessed as an activity of marine shipping associated with the Project. Further rationale is provided in Section 7.3. Other types of releases are also described in Section 4.0, and the assessment of potential effects on marine vegetation and other marine resources as a result of a spill is included in Section 10.0. **Addressed in TC IR-02 to TC IR-06:** In its response to the Review Panel's IRs of May 10, 2017, Transport Canada has indicated that with respect to chronic oiling, the use of anti-fouling agents, and discharges of ballast water, bilge water, and sewage, that marine water quality in the marine shipping area is not expected to change because these potential contributors are regulated by the *Canada Shipping Act,* 2001, and in particular the Vessel Pollution and Dangerous Chemicals Regulations (VPDCR) under this act. Furthermore, Transport Canada states that "In relation to the Project, the technical requirements of the VPDCR apply to all vessels over 400 gross tonnage. As such, all container ships and most tugs serving container ships that would call at the proposed RBT2 would be subject to these requirements".	**TC IR-02 to TC IR-06, from Transport Canada to the Review Panel Re: Response to IRs issued by the Review Panel on May 10, 2017 (CEAR Document #962)**

Table 22: Mitigation for Marine Biophysical Valued Components (including Onsite Habitat Concepts)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-22.1	Concerned with the availability of resources for mitigation. Requested to be made aware of all the proposed mitigation options, and to know how they are ranked. Stated preference for mitigation for the Project to be undertaken as close to the Project as possible. Requested additional information and details regarding mitigation measures (e.g. noise, crab salvage).	26-Nov-2014, Health & Aboriginal Rights Workshop – Tsawwassen First Nation 19-Jul-2016, Issues Workshop – Musqueam First Nation / Tsawwassen First Nation #1	**26-Nov-2014, Workshop:** Recorded comment for consideration by Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **19-Jul-2016, Workshop:** Recorded comment for consideration by the Project team. **12-Apr-2018, Letter from the VFPA:** Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the RBT2 Crab Mitigation Summary Overview, which detailed the following: • Mitigation measures to avoid or reduce effects to crab as outlined in the EIS; and • Additional crab harvesting related mitigation measure suggestions under review. Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.	**Addressed in EIS Appendix 7.2-B (#197):** The VFPA has adopted the use of the following mitigation hierarchy to address Project effects: 1. Avoidance, such as through Project placement and design, and adherence to fisheries-sensitive windows; 2. Reduction, such as through the implementation of standard management practices and Environmental Management Plans; and 3. Offsetting, which involves the creation and enhancement of biophysical habitats that support species of the Roberts Bank ecosystem. Marine sub-components or representative species that undergo decreases in productivity will be offset to the extent feasible using onsite offsetting. **Addressed in EIS Appendix 7.2-B (#198):** Onsite habitat is intended to soften the perimeter of the Project's shoreline to be more ecologically representative of the existing estuary, to create similar habitat to those that will be affected by the Project, and to create habitat that generally enhances the productivity of the Roberts Bank ecosystem. The onsite habitat concepts presented in EIS Section 17.0 have been presented to Indigenous groups, the community, stakeholders, and the public in Community Meetings and small group meetings that took place in the fall of 2014. The feedback received from Indigenous groups has been considered in the finalisation of the EIS. **Addressed in EIS Section 35.0:** EIS Table 35-2 presents all proposed Mitigation Measures and Commitments related to the project. **Addressed in response to IR-7.31.15-12:** The VFPA's response to IR-7.31.15-12 provides a discussion of mitigation measures considered by the VFPA, including those considered and rejected.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 17.0 Mitigation for Marine Biophysical Valued Components Table 35-2 Proposed Mitigation Measures and Commitments **Information Requests** Response to Information Request #12 (IR-7.31.15-12 of CEAR Document #314)
TFN-22.2	Asked whether the VFPA thinks a fisheries hatchery at RBT2 would be beneficial to have in an area where crabs hatch.	27-Nov-2013, Community Meeting	**27-Nov-2013, Meeting:** Committed to follow-up. **15-Jan-2014, Letter from the VFPA:** *"The VFPA is currently undertaking field studies to collect baseline information that will assist in determining potential impacts on fish and wildlife habitat. Although mitigation requirements will ultimately be determined by regulators through the EA process, the VFPA has developed a number of possible mitigation approaches. A fish hatchery is an example of a possible mitigation approach. Habitat mitigation options will be placed where they are most appropriate and not necessarily at Robert Bank."*	**Additional information provided by the VFPA:** The VPFA welcomes Indigenous groups' input concerning potential project mitigation measures and encourages additional suggestions. The VFPA's response to IR10-12, as requested by the Review Panel, further discusses the VFPA's proposed approach to engagement and consultation with Indigenous peoples during and after the environmental review, including concerning such potential project mitigation measures.	**Information Requests** Response to Sufficiency Information Request #12 (IR10-12)
TFN-22.3	Asked whether a Project Inclusion List would include initiatives that increase the sensitivity	27-May-2014, Technical Working Group Meeting #3	**27-May-2014, Working Group:** Responded that this would not be the sort of thing that would typically be included on a Project Inclusion List. It	**Addressed in MSA Section 2.1.2:** The conservation areas within the Gulf Islands are described in MSA Section 2.1.2 and shown in MSA Figure 2-2. The extent to which potential effects of marine shipping associated with the Project are	**MSA** 2.0 Geographic Setting 2.1.2 Species at Risk and Conservation Areas

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	of the environment, such as the establishment of a marine park and conservation area in the Gulf Islands archipelago.		does not fit within the methodology typically followed when completing cumulative effects assessments. **09-Nov-2015, Letter from the VFPA:** Provided a copy of the MSA, which included Section 2.1.2 Species at Risk and Conservation Areas.	predicted to occur within conservation areas is addressed within each relevant IC or VC section.	Figure 2-2 Conservation Areas in and Near the Marine Shipping Area
TFN-22.4	Interested in making recommendations and providing input to potential studies and/or mitigation measures specific to eulachon.	12-Sep-2016, Issues Workshop – Musqueam First Nation / Tsawwassen First Nation #2	**12-Sep-2016, Workshop:** Stated that the VFPA is open to hearing suggestions for studies, mitigations and follow-up monitoring. Noted that VFPA is looking for collaboration. **12-Sep-2017, Meeting:** The VFPA met with Tsawwassen First Nation to discuss the Follow-up Program and lessons learned from DP3. The VFPA sought feedback from Tsawwassen First Nation on the Follow-up Program and asked what Tsawwassen First Nation felt should be considered, what they felt was important to their community and how they would like to be involved going forward.	**Addressed in response to IR5-15:** In its response to IR5-15, the VFPA specifically discusses existing conditions related to eulachon and describes the status and management practices associated with the species. The IR response also further assesses potential effects of the project on Eulachon, including consideration of underwater noise. With implementation of mitigation measures (specifically underwater noise management plan), no residual effect on eulachon productivity is anticipated. **Additional information provided by the VPFA:** The VFPA acknowledges the importance of eulachon to Indigenous groups and has worked to support eulachon habitat through its Habitat Enhancement Program (HEP). In 2014, HEP provided funding to Pacific Salmon Foundation to support a Fraser River Eulachon Habitat Utilization Survey. This survey involved capturing and tagging 300 eulachon to better understand habitat use as eulachon undergo physical changes prior to river entry and spawning and to gather information to support habitat rehabilitation and abundance recovery. In 2017, HEP provided funding to the Lower Fraser Fisheries Alliance to support an assessment and recovery project for eulachon in the Fraser River.	**Information Requests** Response to Sufficiency Information Request #15 (IR5-15 of CEAR Document #1078)
TFN-22.5	Requested that backup plans to be developed should mitigation measures not prove to be as effective as anticipated. Requested for TFN to have meaningful input into the development of monitoring.	19-Jul-2016, Issues Workshop – Musqueam First Nation / Tsawwassen First Nation #1 12-Sep-2016, Issues Workshop – Musqueam First Nation / Tsawwassen First Nation #2	**19-Jul-2016, Workshop:** Responded that it plans to include Tsawwassen First Nation in discussions about monitoring. Acknowledged those plans will require giving everyone more detail on the mitigation and monitoring measures that have been proposed. **12-Sep-2016, Workshop:** Responded that there are other mitigation measures for crab in addition to the salvage plan. DFO sensitive timing windows have been written into the schedule to protect the gravid female life history, which is from October 31 to March 15. During that time no works would happen below 5 m chart datum. Specific to the salvages, the intent is to avoid direct mortality and to keep that productivity within the system. By doing this those moved will at least avoid certain death. Once moved crabs can move out of the area. **12-Sep-2017, Meeting:** The VFPA met with Tsawwassen First Nation to discuss the Follow-up Program and Crab Study Workshop. Discussed Tsawwassen First Nation's Dungeness Crab Abundance and Movement Study in the RBT2 Project Area, as prepared by LGL Limited and submitted to the Review Panel on July 12, 2017.	**Addressed in EIS Appendix 7.2-B (#32):** The VFPA is committed to developing and implementing a Follow-up Program for the Project. The purpose of the Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project. To ensure the Program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the EIS. The Follow-up Program will include: • An evaluation of the adequacy of existing data to provide a benchmark against which to test Project-related effects; • A monitoring design drawing on the measurable parameters identified to be field-tested; • A methodological approach for using field-collected data to measure and verify the accuracy of the effects predicted in the EIS; • A reporting framework that defines frequency of reporting, distribution and feedback mechanisms; and • Details of the VFPA's approach to adaptive management for the Project through construction and operation.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			The VFPA presented the draft Follow-up Program and sought input from Tsawwassen First Nation on the program. Asked: • What is important to you and your community? • What elements would you like to see monitored? • How would you like to be involved moving forward?	The Follow-up Program will be developed in consultation with federal agencies, including the CEA Agency, DFO, and Environment Canada. Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on the program and approving agencies have an opportunity to evaluate and approve the Program. Feedback from Indigenous groups regarding the draft Program will be sought through the VFPA's ongoing engagement initiatives.	
TFN-22.6	Requested information regarding rejected mitigation measures and the rationale as to why they were rejected.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #231)	**30-Sep-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Agency has requested additional information on mitigation measures in its letter of July 31, 2015 to [the VFPA] (page 6, #12)."*	**Addressed in response to IR-7.31.15-12:** The VFPA's response to IR-7.31.15-12 provides a discussion of mitigation measures considered by the VFPA, including those considered and rejected.	**Information Requests** Response to Information Request #12 (IR-7.31.15-12 of CEAR Document #314)
TFN-22.7	Stated that other than a communications plan, no specific mitigation measures specific to addressing (Commercial, Recreational, Aboriginal) CRA fisheries are provided in EIS Section 17 or 21.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #231)	**30-Sep-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires this information to inform its sufficiency review."*	**Addressed in EIS Section 21.0:** As noted in EIS Table 21-7, proposed mitigation measures related to Marine Commercial use includes: • Implementation of the marine species salvage plan and communications plan; and • Work with DFO to consult with commercial crab harvesters and Indigenous groups to identify and implement feasible mitigation. **Addressed in response to IR7-34:** As noted in the VFPA's response to IR7-34, mitigation measures currently undergoing consultation and evaluation include: • Crab Management Area re-selection opportunity; • Adjustment of proposed navigational closure area expansion with consideration of commercial harvesting during Project operation; • Adjustment of the proposed navigational closure area expansion with consideration of Indigenous harvesting during operation; • Navigational Limited Access Fishing Area (multi-user system during operation); and • Financial compensation. The evaluation of additional mitigation measures is being informed by consultation with commercial crab harvesters (including the Area I Crab Fisherman Association), Indigenous groups, DFO, and may include other relevant regulatory agencies regarding their specific interests and concerns. Evaluation of technical and economic feasibility of the suggested measures is currently underway to inform this consultation. Technical feasibility considers the following: • Availability, applicability, and effectiveness of the specific technology; • Fit with local site characteristics, Project design, construction schedule; • Applicable regulatory frameworks; and • Whether implementation is within the VFPA's jurisdiction. Economic feasibility considers the following: • Scope of the Project design (Project re-design not required); • Construction schedule (Project construction delay not required); and • Total cost of implementation of each measure during construction and/or operation.	**EIS** 21.0 Marine Commercial Use **Information Requests** Response to Sufficiency Information Request #34 (IR7-34 of CEAR Document #1172)

Table 23: Noise and Vibration – Intermediate Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-23.1	Concerned about potential adverse effects of noise on our people and the environment. Concerned that noise model assumptions don't accurately reflect TFN member experiences/ sensitivities. Concerned with the effects on local upland livability from increased noise and light, both during the construction and operational phases of the Project. Stated the potential that adjacent land may be added to TFN treaty settlement lands.	16-Oct-2013, Letter to the CEA Agency 12-Jul-2016, Meeting 19-Jul-2016, Issues Workshop - Musqueam First Nation / Tsawwassen First Nation #1	The VFPA has reviewed this letter and provides the following additional information. **12-Jul-2016, Meeting:** Provided an overview of the changes in the revised RBT2 Human Health Effects Assessment. Explained the methodology and noted that the conclusions of the HHRA are the same. There are residual effects to noise based on a small increase in noise levels associated with the Project. There is also a contribution from existing and future sources, but RBT2 is an important noise source as well as others within the community. The VFPA did its best to understand and estimate what those would be, based on available information and projections. It determined that residual effects are not significant. **19-Jul-2016, Workshop:** Stated that measuring noise sensitivity is not based on specific experiences. In terms of sleep disturbance, speech comprehension and being highly annoyed, the assessment showed that additional noise (primarily from rail rather than ship operations) would not broaden (i.e., affect more people), but that it may increase the frequency of disturbance to those already affected. Stated that it was identified that Tsawwassen and Delta residents would be most likely to experience the effects of noise exposure. Specific data for either Musqueam or Tsawwassen was not available for this assessment.	**Addressed in EIS Section 9.3:** The assessment of Noise and Vibration in EIS Section 9.3 indicates that the predicted daytime-nighttime average noise-level increases for upland receptor sites over expected conditions during Project construction would not be perceptible, including at the Tsawwassen First Nation Longhouse receptor site. Perceptible changes in overall noise levels during operation are also not anticipated for upland receptor sites; however, rates of occurrence of transient and impulsive noise events are expected to increase by up to 8.0 events per hour over expected conditions, and the increased frequency may be noticeable, especially at night. Project operation low-frequency noise levels are not expected to increase to perceptible levels over expected conditions. Net cumulative noise-level changes as a result of the combination of the Project with other certain and reasonably foreseeable projects are anticipated relative to expected conditions for two receptor sites, including the Tsawwassen First Nation Longhouse. However, the changes are not predicted to be within the range of perceptibility. **Addressed in EIS Section 27.0:** EIS Section 27.0 presents an assessment conducted to determine potential Project-related effects on human health. The results of the human health assessment were considered in the assessments of marine commercial use, outdoor recreation, and Current Use. A minority of households would experience small increases in noise during construction or operation. The increase would generally be below the range of human perception, and adverse health effects related to noise are considered not significant, as predicted exposure levels do not exceed health thresholds. Confidence in the assessment is high because models used conservative assumptions and have been validated against studies or monitoring data. The Project is not expected to result in any significant adverse effects on human health. The Project is not expected to result in measurable incremental residual cumulative effects to human health. **Addressed in EIS Appendix 7.2-B (#44):** The spatial boundaries for the noise and vibration assessment, and the rationale for their selection, is included in EIS Section 9.3.The upland study area extends to Canoe Passage. The marine study area includes all marine areas within 10 km of the proposed terminal, including areas at the mouth of the Fraser river and Canoe Passage, north of the northern tip of Westham Island. The spatial boundaries for the noise and vibration assessment, and the rationale for their selection, is included in EIS Section 9.3. **Additional information provided by the VFPA:** In responding to the CEA Agency's AIR-12.04.15-13, it was determined that the correct and measurable noise effect (sleep impairment) in EIS Section 27.0 had not been carried forward for a significance determination of the residual effect, and for a cumulative effects assessment. Revisions were made to EIS Section 27.0 and EIS Appendix 27-B to provide supporting analysis. The section also includes	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 9.0 Physical Setting 9.3 Noise and Vibration 27.0 Human Health

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				revisions related to the comparison of noise levels to international thresholds for speech comprehension and sleep impairment. The overall conclusions of the assessment did not change. Tsawwassen First Nation was notified and provided with the revised version of EIS Section 27.0 and EIS Appendix 27-B on 13-Jun-2016.	
TFN-23.2	Stated that the citing a US FTA report, the EIS notes (p.9.3-7) that "a level of 93 VdB is the approximate threshold of human perception" for vibration. A number of other sources (see below) indicate a much lower perception threshold of approximately 65 VdB. Using a higher threshold may underplay the potential for effects to be rated as "significant". 1. Please provide a rationale for choosing 93 VdB as the effects threshold instead of the commonly used threshold for transit impact assessment of 65 VdB. 2. Please re-evaluate the determination of significance based on the lower threshold of 65VdB.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Additional information provided by the VFPA:** The two thresholds are equivalent but expressed in different units. The U.S. FTA value of 65 VdB is in decibel scale relative to 1x10-6 inches/sec whereas Noise and Vibration assessment (EIS) value is in decibel scale relative to 1x10-9 m/sec, as defined in EIS Appendix 27-A, Section 2.3.1.2. This is consistent with the U.S. FTA Noise and Vibration Impact Assessment manual, which states that the accepted reference quantities for vibration velocity are expressed in incher per second in the U.S., and in m/sec in the rest of the world. As indicated in EIS Appendix 9.3-A, construction and operation vibration levels are not predicted to exceed the threshold of perception of 93 VdB. As indicated in EIS Section 27.6.1.3, the threshold for human annoyance related to vibration, of 103 VdB, is also not exceeded and as such a measurable health effect is not predicted and a determination of significance is not required.	**EIS** 9.3 Noise and Vibration Appendix 9.3-A Noise and Vibration Technical Report 27.0 Human Health Appendix 27-A Air Quality HHRA Technical Report
TFN-23.3	Stated that site 4 is the baseline data collection location for noise and vibration on TFN lands. The EIS notes that baseline data on vibration (VdB) and low-frequency noise (dBC) were not collected at Site 4. Similarly, Lmax from trains (shunting and wheel noise) were not measured. TFN members report experiencing vibration from trucks and trains and both low frequency noise from trains on TFN lands. Requested a rationale for estimating (p.9.3-13) baseline conditions rather than collecting valid baseline data for vibration at Site 4 on TFN Lands.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in responses to IR7-03 and IR7-04:** The VFPA's response to IR7-03, as requested by the Review Panel, provides an analysis of transient noise produced by locomotive pass-bys and train movements at sites 4 and 5 in the upland study area. The analysis demonstrates that the noise levels created by locomotive pass-by events at sites 4 and 5 are not measurable relative to ambient noise levels. The VFPA's response to IR7-04, as requested by the Review Panel, provides the results of low-frequency noise measurements conducted on Tsawwassen First Nation Lands in October 2017.	**Information Requests** Response to Sufficiency Information Request #3 (IR7-03 of CEAR Document #1078) Response to Sufficiency Information Request #4 (IR7-04 of CEAR Document #1141)
TFN-23.4	Stated that deriving an annual average is a valid statistical approach. In doing so, however, models must be both calibrated and verified: real world measurements must be reproducible. There is a discrepancy between night-time (Ln) data collected at Site 4 and predicted annual average Ln for the same site, with predicted Ln being lower 2.6dB than measured Ln. While this is considered to be "barely perceptible", the difference is relevant for two reasons: a) the discrepancy is three times the difference between measurement days; and b) under prediction of present noise conditions may lead to under prediction of future noise conditions. Given that Site 4 Ln is already on or exceeding night-time WHO guidelines for Ln, small	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Additional information provided by the VFPA:** The difference between the measured Ln and the model-predicted annual average Ln should not be considered an underprediction. The difference is due to both the lower elevation of the receiver in the model (versus the roof-mounted receiver that was used in the 2013 field work) and due to the annual-average meteorology that was used in the model (versus the specific meteorology that was present during the 2013 field work).	**EIS** 9.3 Noise and Vibration Appendix 9.3-A Noise and Vibration Technical Report

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	changes may nevertheless result in threshold exceedances. Requested to know why the model under predicts noise when verified against baseline data: is the difference entirely attributable to lowering the receiver, as noted in Appendix 9.3-A, p.42.				
TFN-23.5	Stated that the EIS notes that "in certain months…construction noise is expected to increase". EIS, Appendix 9.3-A indicates the "highest noise levels are expected to occur in January 2019". Asked what is the expected start and duration of dredging. Requested information on which months construction noise is expected to increase and if these increases will be restricted to daytime hours or would occur through the night.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in PCU:** As requested by the Review Panel, the VFPA submitted the PCU on June 12, 2018, providing: • Detailed revised Project description, including a revised construction schedule; • Revised Project interaction matrix; • Preliminary details pertaining to the management and timing of dredging activities and the discharge of sediment-laden water; and • Revised assessment of environmental effects as required by the Project modifications. PCU Sections 1.0 and 2.0 describe the changes to the EIS, including updates to specific construction activities, the construction schedule, and relevant Project Description figures and appendices. In PCU Section 3.0, changes or effects resulting from the construction updates on ICs and VCs are described. Overall, these changes to the EA resulting from construction updates can generally be summarised as follows: • Reductions in potential adverse changes or effects on ICs, biophysical VCs, social VCs, and Current Use; and • Increases in positive interactions with socio-economic VCs. These beneficial changes to ICs and VCs occur at the level of interactions or potential effects, and in most cases are slight changes, and thus do not affect the overall conclusions made in the EIS, including proposed mitigation, residual effect characterisations, significance determinations or cumulative effects, as applicable, with one exception. The only component predicted to have a change to residual effects is land and water use, with a reduction of a residual effect on access to Tsawwassen First Nation community lease lands from a measurable non-significant residual effect to a negligible residual effect, due to elimination of the ITP and associated activities.	**PCU**
TFN-23.6	Stated that to facilitate an understanding of cumulative effects, it would be useful to add columns containing "actual" and "modelled annual" current condition information to Table 9.3-20. Similar tables comparing "existing", "predicted without project" and "predicted with project" values for dBC, VdB and transient/ impulsive noises would also be helpful. Requested the indicated tables, by site and parsed by Ld, Ln, Ldn and Lmax to facilitate review.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR12-05:** The VFPA's response to IR12-05 will further discuss modelled scenarios of the noise and vibration effects assessment.	**Information Requests** Response to Sufficiency Information Request #5 (IR12-05)

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-23.7	Stated that the EIS notes that "it is unclear if these changes [to low-frequency noise] will be perceptible, because human response to low frequency noise is less well understood than the response to A-weighted noise". TFN members have indicated that they already experience low-frequency noise. The certainty that low-frequency noise will increase coupled with the uncertainty regarding the experience of these effects suggests that project approval, if given, should proceed conditional upon establishment of a monitoring and adaptive management program. If approved to proceed, the project should be conditional on the establishment of an adaptive management program for low frequency noise, vibration, and transient noise.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 33.5:** Similar to the Adaptive Management Strategy for DP3, as described in EIS Section 33.5, the VFPA is committed to developing and implementing a Follow-up Program for the Project. The purpose of the Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project. To ensure the Program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the EIS. The Follow-up Program will include: • An evaluation of the adequacy of existing data to provide a benchmark against which to test Project-related effects; • A monitoring design drawing on the measurable parameters identified to be field-tested; • A methodological approach for using field-collected data to measure and verify the accuracy of the effects predicted in the EIS; • A reporting framework that defines frequency of reporting, distribution and feedback mechanisms; and • Details of the VFPA's approach to adaptive management for the Project through construction and operation. The Follow-up Program will be developed in consultation with federal agencies, including the CEA Agency, DFO, and Environment Canada. Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on the program and approving agencies have an opportunity to evaluate and approve the Program. Feedback from Indigenous groups regarding the draft Program will be sought through the VFPA's ongoing engagement initiatives.	**EIS** 33.5 Follow-up Program
TFN-23.8	Stated that taken together, the 10 projects listed in this table will contribute 2500 additional marine vessel movements per year in the vicinity of the project. While individual vessels are present for a brief period of time and are unlikely to affect annual average noise levels, TFN members indicate that transient noises (e.g. vessel horns) are already audible. The Supplemental Shipping report indicates that no baseline data (regarding frequency and sound level) on these transient noises have been collected suggesting that it is premature to draw conclusions regarding significance of effect, residual effect, or cumulative effect. Please collect data on transient vessel noise and predict increases in frequency to determine nature and significance of effect.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR7-02:** The VFPA's response to IR7-02 describes the frequency of occurrence of transient noise events from a container ship while transiting the marine shipping area and while at berth. Information on the Lmax of transient noise events from container ships is provided and noise levels at various setback distances are described. **Addressed in EIS Section 4.4.2.1:** As described in EIS Section 4.4.2.1, the Project is estimated to receive 260 container ship calls per year when the terminal reaches its 2.4 million vessel TEU design capacity. This will result in 520 Project-associated container ship movements per year (one call equals two movements—one inbound and one outbound), or on average approximately three pass-bys, and associated noise, every two days at a given receptor point along the shipping route. Whether or not the noise from a vessel pass-by is perceptible at a receptor point depends on the setback distance from the noise source.	**EIS** 4.0 Project Description 4.4.2.1 Container Ship Manoeuvres **Information Requests** Response to Sufficiency Information Request #02 (IR7-02 of CEAR Document #1104)

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-23.9	With respect to Table 9.3-23, stated that the derivation of the table from data provided in the Appendix cannot be replicated. Please provide: (1) current annual average traffic (2) method for deriving predicted volume ranges identified in table column 2.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in Response to IR7-08:** The VFPA's response to IR7-02 provides a description of how the information presented in EIS Appendix 4-D was used to derive the values presented in EIS Table 9.3-23. As noted in EIS Appendix 4-D, Table 12 provides inbound and outbound total vehicle movements (passenger per service vehicles and container trucks) for the growth scenario of 4.8 million (M) TEUs through the existing Deltaport Terminal, and the proposed RBT2 terminal. The 4.8 M TEU scenario corresponds to future conditions with Project operation. Vehicle movements are provided for each hour of the day such that it is possible to calculate the AADT and percentage heavy vehicles that would be arriving at and departing the Roberts Bank causeway via Deltaport Way. Exhibits 5.4 and 6.4 in Bunt & Associates (2011) provide projected AM and PM peak traffic volumes on Deltaport Way for 2031. The traffic volumes take into account the Tsawwassen First Nation Land Use Plan which includes up to nearly 3,500 additional homes, a 1.2 million sq ft shopping centre, and a 575,000 sq ft mall. The traffic data from EIS Appendix 4-D and Bunt & Associates (2011) were combined to provide total traffic volumes on Deltaport Way for the temporal cases that are considered in EIS Table 9.3-23 (i.e., future conditions with the Project and future conditions with the Project and other reasonably foreseeable projects and activities). Data from EIS Appendix 4-D provides Project-related truck traffic for the on-causeway portion of Deltaport Way. These volumes were used in the assessment of future cumulative changes to noise levels (EIS Section 9.3.10) for the off-causeway portion of Deltaport Way, and are shown in EIS Table 9.3-22 for 'incremental road traffic associated with RBT2'. Annual average daily traffic projections, based on the AM/PM peak traffic data in Bunt & Associates (2011), were estimated using the formula: AADT = AM Peak x 8.	**EIS** Appendix 4-D Roberts Bank Traffic Data Matrix **Information Requests** Response to Sufficiency Information Request #08 (IR7-08 of CEAR Document #1104)
TFN-23.10	Stated that TFN members have noted that late night shift change traffic is particularly disruptive because passenger vehicles are higher pitched and travelling faster, resulting in transient noise spikes. Please model future traffic and Ln for the hour before and after shift change as this may vary significantly from the daily average.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR7-01:** The VFPA's response to IR7-01 provided nighttime equivalent sound levels (Ln) calculated under worst-case meteorological conditions. The calculations were carried out according to ISO 9613 (ISO 1996) with the influence of meteorology on sound propagation accounted for using the CONCAWE method (CONCAWE 1981). Refer to IR7-01 for a detailed discussion of these calculations.	**Information Requests** Response to Sufficiency Information Request #01 (IR7-01 of CEAR Document #1104)
TFN-23.11	Stated that while predicted conditions with the project do not increase appreciably over predicted future conditions without the project, it is important to note that present-day Ln levels are at or exceed recommended WHO guideline for night time noise. TFN members already experience noise as intrusive; any future change will be significant and measures to minimize noise, especially at night, are required. Requested the identification of noise mitigation strategies and/or partner with	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR7-12:** In Appendix A of its submission to the Review Panel (CEAR Document #579), Health Canada provided a list of commonly applied construction mitigation measures and considerations for noise reductions. As part of the VFPA's response to IR7-12, the noise mitigation measures included in the Health Canada submission (CEAR Document #579) have been evaluated at a preliminary level for technical and economic feasibility. In some cases, more detailed technical evaluation would be required before implementation. Further evaluation would be focused on verifying technical and economic feasibility, as well as potential effectiveness and appropriateness in terms of mitigating the	**Information Requests** Response to Sufficiency Information Request #12 (IR7-12 of CEAR Document #1134)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	other project operators to identify collective mitigation strategies to keep night-time noise to <45dBA.			specific RBT2-related sources and types of noise. A summary of the preliminary evaluation is provided in Appendix IR7-12-A, Table IR7-12-A1.	
TFN-23.12	Stated that in reference to Technical Reports Appendix 9.3-A and 9.3-B, Appendix 4-D Section 2.3.3.2, two different sets of standards are referenced. It is important to understand why to evaluate the assessment. Please provide the rationale for using ISO 1996 to calculate port and rail noise and using Setra 1997 to calculate road noise. Do the two standards yield different results when applied to the same data?	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Additional information provided by the VFPA:** In each case, the appropriate standard was used to model these different type of noise sources. ISO 1996 is not intended to be used to model road vehicle noise. Conversely, Setra 1997 is specifically intended to model road vehicle traffic noise and is not capable of modelling other noise sources.	**EIS** 9.3 Noise and Vibration Appendix 9.3-A Noise and Vibration Technical Report Appendix 4-D Roberts Bank Traffic Data Matrix
TFN-23.13	Stated that in reference to Technical Reports Appendix 9.3-A and 9.3-B, Appendix 4-D Section 3.3.7, the Appendix notes that "no results are presented for locomotive pass-bys or train movements at site 4 [on TFN lands] or site 5 as these transient events were not at measurable levels at these sites." TFN members report experiencing transient train noise on TFN lands. Please suggests reasons for reported human perception of noise despite the absence of measurable values and indicate if there are other means to improve understanding of transient nose experience on TFN lands.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in responses to IR7-03 and IR7-04:** The VFPA's response to IR7-03, as requested by the Review Panel, provides an analysis of transient noise produced by locomotive pass-bys and train movements at sites 4 and 5 in the upland study area. The analysis demonstrates that the noise levels created by locomotive pass-by events at sites 4 and 5 are not measurable relative to ambient noise levels. The VFPA's response to IR7-04, as requested by the Review Panel, provides the results of low-frequency noise measurements conducted on Tsawwassen First Nation Lands in October 2017.	**Information Requests** Response to Sufficiency Information Request #3 (IR7-03 of CEAR Document #1078) Response to Sufficiency Information Request #4 (IR7-04 of CEAR Document #1141)
TFN-23.14	Stated that in reference to Technical Reports Appendix 9.3-A and 9.3-B, Appendix 4-D Section 4.1, the summary of key findings in the upland study area focuses exclusively on Ldn. While this number is weighted to include night time noise, it obscures findings regarding the time period - night-time - of most concern to TFN members. It would be useful to add information about Ln, even if the patterns and expected dB increases are similar. Please add information about Ln.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in response to IR7-10:** The VFPA's response to IR7-10 provides information concerning Ln, using modelled results from response to IR7-01. The analysis provided in the response demonstrates the variation in nighttime noise levels that could occur under worst-case meteorological conditions, depending on the Project construction or operation activities taking place at the same time as the worst-case meteorological conditions. While the Panel's context to this information request indicates that information on nighttime noise levels is important for the assessment of sleep disturbance, it should be clarified that the Human Health Risk Assessment for Atmospheric Noise and Vibration (EIS Appendix 27-C) relies on annual-average noise levels to evaluate noise-related risks to human health as per World Health Organization guidelines (WHO 2009). As such, it is not appropriate to use these worst-case Ln to evaluate potential noise-related health effects due to sleep disturbance, but rather the annual average Ln values (representing annual average meteorological conditions) provided herein. The annual average Ln values for Project construction and operation are also included in EIS Section 9.3.9.3.	**Information Requests** Response to Sufficiency Information Request #10 (IR7-10 of CEAR Document #1113)

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-23.15	Stated that in reference to Technical Reports Appendix 9.3-A and 9.3-B, Appendix 4-D Section 4.2, the absence of winter sampling is of concern to TFN members. Winter sampling is needed to validate the model's accuracy in all four seasons. Please collect supplemental winter noise data for all parameters (dBA, dBC, VdB) to calculate Ld, Ln, and Lmax.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Additional information provided by the VFPA:** Noise measurements were collected in summer months as a conservative approach. Noise levels are expected to be higher in summer due to higher vehicle traffic. The VFPA website provides results of continuous noise monitoring at Roberts Bank, where noise levels can be viewed in all seasons. https://www.portvancouver.com/port-dashboard/noise-monitoring/.	
TFN-23.16	Stated that Tsawwassen Members have identified concerns with both low frequency noise (vibration) and atmospheric noise inside of their properties and homes, and have noted anecdotally to Tsawwassen Government staff and advisors that these environmental effects are caused by the operations of the existing Roberts Bank facility, and that these effects often disturb their sleep. The experience of Tsawwassen Members, who are receptors of atmospheric and low-frequency noise generated as a result of the operation of the current Roberts Bank Superport is not reflected by the result of the EIS.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 9.3.7:** The description of existing conditions considered sources of noise and vibration, including the existing Roberts Bank terminals, BC Ferries Terminal and road and rail traffic within the upland study area. Existing noise levels are typical of suburban areas, and noise within the upland study area comes from many diverse sources, including the following: • Activity at Roberts Bank terminals and BC Ferries Terminal; • Road and rail traffic on the Roberts Bank causeway; • Road and rail traffic on routes within the study area (including Highway 17 and Deltaport Way); • Construction activities on Tsawwassen First Nation land; • Farming activities; • Aircraft; • Marine vessels; • Local activities; and • Natural sounds (e.g., wildlife, wind). No single source tends to dominate these noise environments; noises from all of these sources contribute in varying degrees to the overall average daily noise levels.	**EIS** 27.0 Human Health 27.5.3.2 Existing Health Conditions Related to Noise and Vibration
TFN-23.17	Concerned that the characteristics of the receptor against which noise effects are modelled is not reflective of Tsawwassen people.	19-Jul-2016, Issues Workshop – Musqueam First Nation / Tsawwassen First Nation #1	**19-Jul-2016, Workshop:** Explained that unlike certain other things where average experience might be looked at, with the noise assessment the Project team tried to pick points closest to the noise source and choose locations that have particular uses that might be interrupted by noise, and model at that location. It's conservative in that if the effect isn't experienced there, then the effect only decreases for other locations. The assessment assumes that a certain amount of noise will wake you up. The measuring of whether it's enough to wake someone up or not isn't predicated on who that person is. In terms of sleep disturbance—speech comprehension and being highly annoyed—what it said was that additional noise (which is more from rail as opposed to from ship operations) wouldn't broaden (that is to say go out further and affect more people), but that those people already disturbed may be disturbed more often.		

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			The VFPA referred to the World Health Organization guidelines noting the number of additional people potentially waking up is not significant at the population level. However, if you're somebody there, it doesn't matter whether or not the noise is affecting people at the population level, you're going to be annoyed and sleep disturbed. That is the summary of what the noise assessment found. The results fed back into other areas (sub-components) of the health assessment such as stress and annoyance, and also health inequity. There are a number of different areas that could lead into health inequity, including benefits and downsides resulting from the Project. The exposure to noise was identified as having no potential positive effect—only negative—and that the people most likely to experience that negative effect are Tsawwassen and Delta members. While Indigenous populations within B.C. and Canada generally have worse health outcomes, specific data for either Musqueam or Tsawwassen wasn't available. That's the best explanation of what's been done in terms of noise, which is important.		

Tsawwassen First Nation

Table 24: Outdoor Recreation – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-24.1	Concerned with the Deltaport Causeway and rail crossing in the context of accessing the waterfront area north of the causeway and safety to pedestrians and recreational land users. The safety concern is greater with the higher rail traffic associated with operations of RBT2. Suggested that the VFPA build a pedestrian overpass, in part to address impacts to the community from the Project.	31-Jan-2014, Email 23-Apr-2014, ITK Meeting with Elders 14-Sep-2015, Meeting	**31-Jan-2014, Email:** Recorded comment for consideration by the Project team. **23-Apr-2014, Meeting:** Recorded comment for consideration by the Project team. **04-Dec-2015, Letter from the VFPA:** Tsawwassen First Nation is requesting that, as part of the Terminal 2 community amenity contribution, "VFPA construct a pedestrian overpass over Highway 17 at Tsawwassen Drive or another preferred location, in consultation with TFN". Tsawwassen First Nation notes that "Delta also supports a pedestrian overpass over Highway 17." The VFPA would be prepared to enter into a discussion with Tsawwassen First Nation and Delta as to whether an overpass over Highway 17 would be a potential RBT2 amenity benefit for your communities. We will follow up to determine your interest in such a discussion. **16-Dec-2015, Meeting:** Tsawwassen First Nation indicated that they are not interested in pursuing the overpass project at the moment. **11-Jul-2017, Letter from the VFPA to Tsawwassen First Nation and City of Delta:** *"The VFPA appreciates the continued interest from Tsawwassen First Nation, the Corporation of Delta and community members in a pedestrian /cyclist overpass at Deltaport Way.* *We welcome future discussions of this proposal, as well as other potential community benefits, in the context of the proposed RBT2 Project. We hope to commence discussions with you on possible project-related benefits in the fall of 2017."*	**Addressed in response to IR7-40:** The Project will not change the current access to, use of, or spatial footprint of the Brunswick Point Trail and Tsawwassen Sea Dyke Trail. As per the EA methodology outlined in EIS Section 8.0, no project interaction and in turn, no effects to other land-based outdoor recreation sub-component of the outdoor recreation VC (which includes land-based walking, hiking, running, and cycling activities in the LAA) were identified or carried forward for assessment. As mitigation measures are only required when effects are identified, mitigation is not required. As part of the community benefit program, the VFPA welcomes further discussion on the development of a pedestrian and cyclist overpass at Deltaport Way with Tsawwassen First Nation and the City of Delta. The VFPA has indicated in a letter dated July 11, 2017 to Tsawwassen First Nation and City of Delta that it is open to further discussion on the possibility of the pedestrian and cyclist overpass, as well as other potential community benefits.	**Information Requests** Response to Sufficiency Information Request #40 (IR7-40 of CEAR Document #1116)

Table 25: Potential Accidents or Malfunctions

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-25.1	Asked if the assessment factors in accidents involving non-hazardous materials.	07-Oct-2014, Preliminary EIS Workshop #1	**07-Oct-2014, Workshop:** Responded that in the Plausible Worst Case Scenarios listed, in addition to fuel spills, they're assuming that hazardous goods being transported are also spilled. Stated that there is not a worst case scenario that considers a non-hazardous materials spills. Noted that team would take that back for consideration. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues Section 30.0 on Potential Accidents and Malfunctions.	**Additional information provided by the VFPA:** The EIS (Sections 30.0, 30.4 and 30.5) and MSA (Section 10.0) identified potential accidents or malfunctions related to the Project and Marine Shipping. Both non-hazardous (e.g., aggregate, non-hazardous container cargo) and hazardous (e.g., hydrocarbons, dangerous goods) materials were considered, however because magnitude of environmental risk associated with a particular accident or malfunction is a function of the event's probability and its anticipated consequences (including environmental effects), incidents involving non-hazardous materials were not analysed in detail like the plausible worst-case scenarios in EIS Section 30.6 and MSA Section 10.3.	**EIS** 30.0 Potential Accidents or Malfunctions 30.4 Potential Marine-based Accidents and Malfunctions 30.5 Potential Land-based Accidents and Malfunctions 30.6 Assessment of Plausible Worst-Case Scenarios **MSA** 10.0 Potential Accidents or Malfunctions 10.3.3 Identification of Plausible Worst-case Accident or Malfunction Scenarios
TFN-25.2	Disagreed with the statement that there is no potential for Project interactions with oil tankers, and/or an oil-related accident or malfunction; the terminal faces a shipping lane and oil tankers come up and down the coast.	07-Oct-2014, Preliminary EIS Workshop #1 21-Jul-2015, Meeting	**07-Oct-2014, Workshop:** Responded that the quantitative risk assessment takes a broader scope, and does look at the potential for that interaction, but within this section of the EIS, the list has been narrowed down to plausible worst-case scenarios that are relevant to the scope of the assessment and Project, and in the VFPA's jurisdiction. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **21-Jul-2015, Meeting:** Explained that the route that will be used is the same as the route studied on other projects. Added that effects related to the Project are expected to be similar to what is currently experienced. Information being sought are potential effects, impacts to treaty rights, suggestions regarding mitigation and Current Use information. Described one of the worst-case scenario considered in the MSA: risk of containership grounding in Boundary Passage, resulting in a heavy oil spill. **09-Nov-2015, Letter from the VFPA:** Provided a copy of the MSA, which included information regarding potential accidents and malfunctions.	**Addressed in EIS Appendix 7.2-B (#204):** Potential spills of deleterious materials (e.g., hydrocarbons) and their environmental effects are discussed in the EIS. Plausible worst-case scenarios involving a marine vessel, motor vehicle, and train accident, each assumed to result in a spill of deleterious materials, are assessed. The regulatory management framework, standard practices, and Project-specific measures to reduce the risk of accidents or malfunctions, including spills, as well as the emergency response and mitigation measures to be implemented in the event of a spill are described. Three worst-case scenarios involving hydrocarbon spills were assessed: a container ship impact incident at the terminal, a tanker truck accident on Roberts Bank Way North, and a yard locomotive derailment on the widened causeway. The assessment determined that a ship impact scenario involving a marine spill of heavy fuel oil at the terminal would result in adverse residual effects to all marine biophysical VCs, as well as marine commercial use, outdoor recreation, and land and water use. While the residual effects on SRKW, coastal birds, and Current Use were considered significant, due to the extremely low probability of such a scenario, all residual effects were considered unlikely. Since the diesel spill in each of the land-based scenarios would occur away from the marine environment, no potential interactions with marine biophysical VCs were identified. Further, no residual adverse effects were identified with respect to socio-economic VCs, including services and infrastructure and human health. As with any activity, the potential for unplanned incidents during Project construction and operation exists. The VFPA, its tenants, contractors, operators, and intermodal partners are committed to continue to improve port-wide operational practices and procedures to ensure the safety of workers and the public, and protection of the environment. The composition and number of hazardous goods containers handled at Deltaport Terminal in 2012 was reviewed during the development of EIS Appendix 30-A (Appendix B, Table B-4). The estimated probability and potential consequences of a range of accidents or malfunctions, including spills of deleterious materials from ships during Project construction and operation, are described in the EIS. **Addressed in MSA Section 10.0:** The assessment of potential accidents or malfunctions considers a variety of potential effects related to two plausible worst-case scenarios selected based on the analysed probabilities of occurrence, higher risk areas, and possible consequences: • A collision between a container ship and a small vessel within an existing shipping lane, resulting in damage to the vessel and/or gear as well a serious injury or fatality; and	**EIS** 30.0 Potential Accidents or Malfunctions Appendix 30-A Marine Vessel Incidence Prediction Inputs to the Quantitative Risk Assessment Appendix B – Tables **MSA** 4.0 Activity Description Figure 4-1 Marine Shipping Area, Shipping Lanes, and Locations of Interest 10.0 Potential Accidents or Malfunctions 10.3.3 Identification of Plausible Worst-case Accident or Malfunction Scenarios 10.4 Mitigation Measures 10.5 Assessment of Potential Effects of Accidents or Malfunctions Appendix 10-A Marine Vessel Incidence Prediction Inputs to the Quantitative Risk Assessment

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				• A powered grounding of a container ship on a hard substrate, resulting in a spill of 7,500 m3 of heavy fuel oil. In both cases, the identified residual adverse effects are unlikely to occur, because of the very low probability of the accident scenarios. **Addressed in MSA Section 10.3.2.2:** As noted in MSA Section 10.3.2.2, EIS Appendix 30-A and MSA Appendix 10-A provide the evaluation of the potential for a collision between a container vessel and each of four types of marine vessels in the marine shipping area: crude tankers, other tankers (product and chemical), bulk carriers, and other container ships. After considering a series of variables, including the outcome that a spill is associated with the collision, the analysis found the following: • Minimum return period (at 95% confidence level) for collisions of RBT2-bound container ships with other traffic in the marine shipping area of 133 years; • Container ship-tanker collision return periods of over 10,000 years and those for laden crude oil tankers even lower, due to the fact that only outbound crude oil tankers are expected to be laden with crude oil; and • Minimum return period for a container ship collision with another container ship is approximately 250 years. A collision does not necessarily lead to a spill. Worldwide data indicate collisions resulting in spills are less likely. The analysis in EIS Appendix 30-A (Tables 3-14 and 3-15, at full RBT2 traffic plus other foreseeable marine facilities) found the following: • Minimum return periods (at 95% confidence level) for a collision between RBT2-bound container ships and other container ships that results in a spill (of fuel oil) are approximately 10,000 years; and • Minimum return periods (at 95% confidence level) for a collision between RBT2-bound container ships and laden crude oil tankers that result in a crude oil spill are over 800,000 years.	
TFN-25.3	Concerned that a collision might occur just south of Point Roberts resulting in fuel spreading into the Boundary Bay area. Noted that Boundary Bay is an area for harvesting fish and crabs, and TFN is close to having a harvesting plan in Boundary Bay finalized.	21-Jul-2015, Meeting	**21-Jul-2015, Meeting:** Recorded comment for consideration by the Project team. **09-Nov-2015, Letter from the VFPA:** Provided a copy of the MSA, which included information regarding potential accidents and malfunctions.	**Additional information provided by the VFPA:** It is conceivable that a collision might occur just south of Point Roberts, however collisions and associated spills in the marine shipping area will have the highest probability of occurrence where the probability of an encounter between ships is highest, based on the relative risk of overtaking, head-on, and crossing encounters. The most likely encounter locations in the marine shipping area are near East Point on Saturna Island at the eastern entrance to Boundary Passage, and near Turn Point on Stuart Island at the entrance to Haro Strait at the southwest end of Boundary Passage. A collision resulting in a spill in that region is considered as a plausible worst-case scenario in MSA Section 10.3.3. **Addressed in MSA Section 10.0:** The assessment of potential accidents or malfunctions considers a variety of potential effects related to two plausible worst-case scenarios selected based on the analysed probabilities of occurrence, higher risk areas, and possible consequences: • A collision between a container ship and a small vessel within an existing shipping lane, resulting in damage to the vessel and/or gear as well a serious injury or fatality; and • A powered grounding of a container ship on a hard substrate, resulting in a spill of 7,500 m^3 of heavy fuel oil. In both cases, the identified residual adverse effects are unlikely to occur, because of the very low probability of the accident scenarios.	**MSA** 10.0 Potential Accidents or Malfunctions 10.3.3 Identification of Plausible Worst-cast Accident or Malfunction Scenarios 10.4 Mitigation Measures Appendix 10-B Marine Fate of Shipping Spill-type Accidents
TFN-25.4	Asked if the incident at Westshore in 2012 is included	07-Oct-2014, Preliminary EIS Workshop #1	**07-Oct-2014, Workshop:** Responded that the team writing this section is aware of the incident and has whatever	**Addressed in EIS Appendix 7.2-B (#211):** The EIS describes a range of previous construction- and operation-related accidents and malfunctions that have occurred at the Roberts Bank terminals, including the incident involving the Cape Apricot at the Westshore Terminals in December 2012.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	in the assessment.		information is available, and is considering the most recent local incidents in their analysis.		30.0 Potential Accidents or Malfunctions 30.4.3 Vessel Allision
TFN-25.5	Interested in whether the terminal operator will be required to recognise the significance of an accident or malfunction that results in an effect to TFN's right to harvest.	26-Nov-2014, Health & Aboriginal Rights Workshop - TFN	**26-Nov-2014, Workshop:** Recorded comment for consideration by Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#207):** The EIS describes the parties who would be notified and assume responsibility as On Scene Commander for spill clean-up in the event of a marine spill within VFPA jurisdiction, including Roberts Bank. These parties include the Canadian Coast Guard and the Western Canada Marine Response Corporation. The VFPA's role following a spill would be to maintain situational awareness and coordinate the incident response. **Addressed in EIS Appendix 7.2-B (#208):** Generally, the owner of the vessel from which the spill originates is responsible, in accordance with the *Marine Liability Act*. There is more information on liability on Transport Canada's website, which explains liability and compensation for oil spill clean-up and damages, including funds available for clean-up: http://www.tc.gc.ca/eng/marinesafety/menu-4100.htm#m. Additional sources information on funds available for clean-up are available at the following link: https://www.tc.gc.ca/eng/marinesafety/oep-ers-regime-funds-1119.htm. **Additional information provided by the VFPA:** Taking into account the Review Panel's report, the Minister of the Environment decides whether the project is likely to cause significant adverse environmental effects. If the Minister's decision is that the project is likely to cause significant adverse environmental effects, the matter is referred to the Governor in Council (Cabinet) who will decide if the likely significant adverse environmental effects are justified in the circumstances. Before making these decisions, the Government of Canada will assess potential impacts to Aboriginal and treaty rights. If the Minister's decision is that the project is not likely to cause significant adverse environmental effects or if the project is likely to cause significant adverse environmental effects that have been determined by the Governor in Council to be justified in the circumstances, the conditions with respect to mitigation measures and a follow-up program with which the proponent must comply for the proposed project to be carried out, are set out in the environmental assessment decision statement issued by the Minister. The Terminal Operator will be required to comply with all of these conditions. **Addressed in response to IR11-07:** The VFPA's response to IR11-07, as requested by the Review Panel, discusses measures, and the roles and responsibilities for implementing those measures, that would be applied to assess, monitor and mitigate environmental effects following the occurrence of an accident or malfunction.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 30.0 Potential Accidents or Malfunctions 30.3.3 VFPA Practices and Procedures **Information Requests** Response to Sufficiency Information Request #07 (IR11-07)
TFN-25.6	Concerned about impacts to small fishing vessels from the Project. Concerned with accidents and spills, and particular concern that the Accidents and Malfunctions section does not take into account small fishing vessels.	18-Nov-2013, Community Meeting 07-Oct-2014, Preliminary EIS Workshop #1	**18-Nov-2013, Meeting:** Recorded comment for consideration by Project team. **15-Jan-2014, Letter from the VFPA:** As part of the EA for the proposed Project, the VFPA is looking at worldwide collisions and local collisions to determine what is reasonable for a predicted rate of marine accidents and malfunctions related to RBT2. **07-Oct-2014, Workshop:** Responded that the marine vessel category is where fishing vessels were considered. The reason that a fishing vessel scenario didn't make it into the initial list of Plausible Worst-case	**Addressed in EIS Appendix 7.2-B (#204):** Potential spills of deleterious materials (e.g., hydrocarbons) and their environmental effects are discussed in the EIS. Plausible worst-case scenarios involving a marine vessel, motor vehicle, and train accident, each assumed to result in a spill of deleterious materials, are assessed. The regulatory management framework, standard practices, and Project-specific measures to reduce the risk of accidents or malfunctions, including spills, as well as the emergency response and mitigation measures to be implemented in the event of a spill are described. Three worst-case scenarios involving hydrocarbon spills were assessed: a container ship impact incident at the terminal, a tanker truck accident on Roberts Bank Way North, and a yard locomotive derailment on the widened causeway. The assessment determined that a ship impact scenario involving a marine spill of heavy fuel oil at the terminal would result in adverse residual effects to all marine biophysical VCs, as well as marine commercial use, outdoor recreation, and land and water use. While the residual effects on SRKW, coastal birds, and Current Use were	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 30.0 Potential Accidents or Malfunctions 30.4.4 Vessel Collision Appendix 30-A Marine Vessel Incidence Prediction Inputs to the Quantitative Risk Assessment **MSA** 9.5 Current Use of Lands and Resources for Traditional Purposes and Aboriginal and

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			Scenarios was because of the worst-case nature of a potential incident. Because this is a marine environment, and most of our VCs are marine biophysical, spill volume was looked at as the main criteria for worst-case. So, the bigger the potential spill, the worst-case scenario. For example, a fishing vessel would have a smaller fuel tank than a bulk carrier berthing at Westshore. However, there are other potential worst-case consequences with a fishing vessel, like loss of life to the operator, for example. It is noted the quantitative risk assessment will be included as an appendix to the EIS; the VFPA undertakes to take the comment back for consideration. **29-Oct-2014, Meeting:** The VFPA held a workshop on Current Use and marine commercial use. Responded that a "Quantitative Risk Assessment [EIS Appendix 30-A] identifies safety risks for small vessels will be an Appendix in the EIS. That study indicated that this Project will result in increased vessel traffic. It also asked what other types of vessels they will interact with, and considered the potential risk of collision and/or interaction between them. One of the subsets of vessels was commercial fishing vessels, which [Golder Associates] drew upon for this assessment as point of a cross-reference.	considered significant, due to the extremely low probability of such a scenario, all residual effects were considered unlikely. Since the diesel spill in each of the land-based scenarios would occur away from the marine environment, no potential interactions with marine biophysical VCs were identified. Further, no residual adverse effects were identified with respect to socio-economic VCs, including services and infrastructure and human health. As with any activity, the potential for unplanned incidents during Project construction and operation exists. The VFPA, its tenants, contractors, operators, and intermodal partners are committed to continue to improve port-wide operational practices and procedures to ensure the safety of workers and the public, and protection of the environment. The composition and number of hazardous goods containers handled at Deltaport Terminal in 2012 was reviewed during the development of EIS Appendix 30-A (Appendix B, Table B-4). The estimated probability and potential consequences of a range of accidents or malfunctions, including spills of deleterious materials from ships during Project construction and operation, are described in the EIS. **With respect to small vessels, see EIS Appendix 7.2-B (#206):** A quantitative risk assessment of potential accidents and malfunctions related to marine vessel traffic, including the risk of a collision between a container ship and small craft (i.e., fishing and recreational vessels), was undertaken and is described in EIS Section 30.0, as well as EIS Appendix 30-A. **Addressed in MSA Section 10.0:** The assessment of potential accidents or malfunctions considers a variety of potential effects related to two plausible worst-case scenarios selected based on the analysed probabilities of occurrence, higher risk areas, and possible consequences: • A collision between a container ship and a small vessel within an existing shipping lane, resulting in damage to the vessel and/or gear as well a serious injury or fatality; and • A powered grounding of a container ship on a hard substrate, resulting in a spill of 7,500 m3 of heavy fuel oil. In both cases, the identified residual adverse effects are unlikely to occur, because of the very low probability of the accident scenarios.	Treaty Rights 9.5.5.1 Negligible Effects of Vessel Transit on Current Use 9.5.5.2 Potential Effects of Vessel Transit on Current Use 10.0 Potential Accidents or Malfunctions 10.3.3 Identification of Plausible Worst-case Accident or Malfunction Scenarios 10.4 Mitigation Measures
TFN-25.7	Concerned with the way in which probability of accidents and malfunctions is described in the EIS as it relates to potential impacts to crabs.	19-Jul-2016 - Issues Workshop - Musqueam First Nation / Tsawwassen First Nation #1	**19-Jul-2016, Workshop:** Responded that there is not a potential pathway for increased contamination [to crabs] from construction or operation. With regard to accidents and malfunctions, the conclusion is different and that's in a different section of the EIS.	**Addressed in EIS Section 30.0:** Potential effects to crabs of three worst-case scenarios are considered in EIS Section 30.6. The Project does not involve the shipment of fuel and therefore the assessment considered the potential spill of fuel required for container ship operation. The assessment concluded that a spill from the fuel tanks of a container ship in the berth area could result in adverse residual effects to marine vegetation, invertebrates, fish and marine mammals, as well as marine commercial use, outdoor recreation and land and water use. With the exceptions of SRKW, coastal birds, and current use, these residual effects were considered not significant. However, due to the extremely low probability of such a ship impact and spill scenario, all residual effects were considered unlikely. In the case of land-based activities, the two worst-case plausible road and rail scenarios were identified as a fuel truck accident on Roberts Bank Way North involving a diesel spill, and a yard locomotive derailment on the widened causeway, also involving a diesel spill. In both cases, due to Project-specific conditions and existing and anticipated practices and procedures, the probability of such an incident is considered very low. As the spill associated with each of the land-based scenarios would occur at a distance away from the marine environment, no potential interactions with marine biophysical VCs were identified. Further, no residual adverse effects were identified with respect to socio-economic VCs, including services and infrastructure, and human health.	**EIS** 30.0 Potential Accidents or Malfunctions 30.6 Assessment of Plausible Worst-Case Scenarios 30.6.1.3 Plausible Worst-Case Scenario #1 Effects Assessment

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-25.8	Stated that TFN was unable to find in Section 30 of the EIS the identification of the magnitude, including quantity, mechanism, rate, form and characteristics of the contaminants and other materials that could be released to the environment during a Land-based accident or malfunction event during operations or for construction related accidents and malfunctions.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #231)	**30-Sep-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires this information to inform its sufficiency review."*	**Addressed in EIS Section 30.0:** EIS Section 30.0 presents three worst-case scenarios for assessment, including two on land: • Tanker truck accident on Roberts Bank Way North; and • Derailment of a yard locomotive on the widened causeway. In each case, the scenario's spilled quantity, mechanism of failure and spill characteristics are presented.	**EIS** 30.0 Potential Accidents or Malfunctions 30.6 Assessment of Plausible Worst-Case Scenarios

Table 26: Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current Use of Lands and Resources for Traditional Purposes

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-26.1	Requested that First Nations review draft sections on traditional and current use.	03-Jul-2014, Valued Components Workshop #2	**03-Jul-2014, Workshop:** Stated that the VFPA is working on the draft EIS and is hoping to have it done in the fall. Noted that it is not complete and this dialogue is important to consider. **15-Jul-2015, Email:** Provided Tsawwassen First Nation with their draft community profile for review. Tsawwassen First Nation provided comments on 30-Jul-2014. **09-Dec-2014, Email:** Provided Tsawwassen First Nation with a draft portion of EIS Section 32.0 concerning Tsawwassen First Nation rights and Current Use information, a draft portion of EIS Section 21.0 concerning Indigenous commercial fishing and seafood harvesting, and a draft version of EIS Appendix 18-A. Tsawwassen First Nation provided comments on 09-Jan-2015. **25-Mar-2015, Letter from the VFPA:** Feedback received was considered and incorporated into the EIS as appropriate, as identified by letter sent to Tsawwassen First Nation. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#15):** Since January 2011, the VFPA has consulted with Indigenous groups regarding Project planning, components and activities, selection of VCs, the potential effects of the Project, proposed mitigation measures, and potential changes to the environment related to the Project. The VFPA also held technical workshops with Indigenous groups at which the VFPA and technical specialists engaged directly with members of Indigenous groups, discussing specific areas of Indigenous interest and reviewing related technical topics. The intent of the fall 2014 workshops, as described in EIS Section 7.2.2 and detailed in EIS Appendix 7.2-A, was to provide preliminary EIS results and proposed mitigations and obtain feedback in a simplified presentation and plain language format. Materials were provided to Indigenous groups approximately two weeks in advance of workshops, to provide time to read the material so that questions and comments could be raised in the workshops. The VFPA also provided an opportunity to provide further comment following the workshops. Most questions asked during consultation are addressed in this appendix. Some questions, comments and requests were addressed at the workshops or through follow up communications. The process identified for responding to Indigenous interests and/or issues is provided in the EIS. The VFPA continues to be open to hear concerns and will notify Indigenous groups when the EIS is submitted.	**EIS** 7.0 Engagement and Consultation 7.2 Aboriginal Engagement and Consultation 7.2.2 Pre-EIS Submission Consultation Process 7.2.3 Future Planned Engagement and Consultation Appendix 7.2-A Consultation Activities by Aboriginal Group Appendix 7.2-B Aboriginal Groups Interests and Issues Table
TFN-26.2	Noted that TFN does not distinguish between traditional and contemporary uses of resources, in that current use/harvesting is a contemporary expression of an activity that's been carried out for thousands of years. Requested that harvesting as defined by the TFN harvesting agreement be incorporated into the assessment for current use of lands and resources for traditional purposes.	26-Nov-2014, Health & Aboriginal Rights Workshop - Tsawwassen First Nation	**26-Nov-2014, Workshop:** Noted that input is welcome. If it's a resource that has been traditionally harvested in the past and continues to be harvested now, it would be characterised as for "traditional purposes", regardless of end use. It is noted "traditional purposes" is not defined by the CEA Agency. Stated that the *EIS Guidelines* and the CEA Agency legislation leave a lot of room for interpretation. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#158):** The assessment of Current Use was carried out in accordance with the *EIS Guidelines*. Harvesting, as defined by the Tsawwassen First Nation Harvest Agreement, is consistent with the assessment of Current Use. The agreement is also considered in EIS Section 21.0.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 21.0 Marine Commercial Use 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Lands and Resources for Traditional Purposes

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-26.3	Concerned with the level of uncertainty with regard to information provided and available for the hunting and trapping of smaller animals. Stated that TFN suspects some hunting or trapping of smaller animals is occurring, despite none being reported.	26-Nov-2014, Health & Aboriginal Rights Workshop – Tsawwassen First Nation	**26-Nov-2014, Workshop:** Recorded comment for consideration by Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#172):** The harvesting of plants, birds (including waterfowl) hunting and trapping of smaller animals, as well as other harvesting activities, are included in EIS Section 32.2. The Project is not predicted to have an effect on the Current Use related to harvest of plants or birds, or on hunting and trapping of waterfowl and smaller animals. **Additional information provided by the VFPA:** The VFPA interviewed Tsawwassen First Nation hunters on 01-May-2014, 06-May-2014 and 03-Jun-2014. The VFPA sought to learn about Tsawwassen First Nation practices, posed questions about Current Use of lands for hunting birds, marine mammals and terrestrial wildlife. They discussed areas used for hunting, and specifically talked about birds, ducks, geese, deer, and changes in the ability to hunt over time, and participation in hunting over time. They also discussed the importance of hunting as a food source, and well as with respect to cultural significance.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Lands and Resources for Traditional Purposes
TFN-26.4	Requested that the context in which "culture" is defined in the Tsawwassen First Nation Final Agreement (2009) be considered in the VFPA's interpretation. Noted that the definition was drafted and tabled by the Province, and not supported by TFN because it is far too limiting.	26-Nov-2014, Health & Aboriginal Rights Workshop - Tsawwassen First Nation	**26-Nov-2014, Workshop:** Stated that while the VFPA referred to that definition, it does not limit the VFPA's interpretation of culture. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#182):** The EIS notes that the definition of culture included in the Tsawwassen First Nation Final Agreement was tabled by the Province and is not supported by Tsawwassen First Nation.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2.4 Tsawwassen First Nation
TFN-26.5	Stated that TFN is of the view that there will be a detectable effect to crab harvesting for traditional purposes in or near the Project area as a result of changes in access during the construction phase of the Project.	26-Nov-2014, Health & Aboriginal Rights Workshop - Tsawwassen First Nation	**26-Nov-2014, Workshop:** Stated that the information being presented today is preliminary, and the language used in the presentation is reflective of that (i.e. "There may be a detectable effect"). **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **27-Jun-2017, Letter from the VFPA:** Stated that as a result of work undertaken over the past year to address concerns raised by Tsawwassen First Nation and other Indigenous groups related to Dungeness crabs and disposal at sea (DAS), and to reduce potential environmental effects from the Project, the VFPA has determined that the ITP is no longer required as a temporary storage location to support project construction. The elimination of the ITP, along with other changes will result in a Project that will not require a DAS permit.	**Addressed in EIS Appendix 7.2-B (#165):** The assessment of Current Use includes evaluation of potential effects to crab harvesting related to changes in access. The assessment concludes that after the implementation of mitigation, a negligible residual effect is anticipated. A determination of significance is not made on negligible residual effects, as the effect is not measurable or detectible. **Addressed in PCU:** As requested by the Review Panel, the VFPA submitted the PCU on June 12, 2018, providing: • Detailed revised Project description, including a revised construction schedule; • Revised Project interaction matrix; • Preliminary details pertaining to the management and timing of dredging activities and the discharge of sediment-laden water; and • Revised assessment of environmental effects as required by the Project modifications. PCU Sections 1.0 and 2.0 describe the changes to the EIS, including updates to specific construction activities, the construction schedule,	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.3.2.1 Potential Impacts on the Exercise of Treaty Rights -- Tsawwassen First Nation **PCU**

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				and relevant Project Description figures and appendices. In PCU Section 3.0, changes or effects resulting from the construction updates on intermediate and valued components (ICs and VCs) are described. Overall, these changes to the EA resulting from construction updates can generally be summarised as follows: • Reductions in potential adverse changes or effects on ICs, biophysical VCs, social VCs, and Current Use; and • Increases in positive interactions with socio-economic VCs. These beneficial changes to ICs and VCs occur at the level of interactions or potential effects, and in most cases are slight changes, and thus do not affect the overall conclusions made in the EIS, including proposed mitigation, residual effect characterisations, significance determinations or cumulative effects, as applicable, with one exception. The only component predicted to have a change to residual effects is land and water use, with a reduction of a residual effect on access to Tsawwassen First Nation community lease lands from a measurable non-significant residual effect to a negligible residual effect, due to elimination of the ITP and associated activities.	
TFN-26.6	Concerned with interference of construction activities with TFN access, including crab boats and traps. Requested for a marine traffic plan that addresses these issues.	12-Feb-2015, Meeting	**12-Feb-2015, Meeting:** Stated that a review of impacts to crabs was done and that there are specific mitigations which will be described in the EIS. Presented information on the Land and Marine Traffic Management Plan, stating that the VFPA will develop and ensure implementation of a Land and Marine Traffic Management Plan) to address land-and marine-based construction traffic, traffic control, and potential traffic hazards on the Project site and within PMV jurisdiction, while establishing a protocol for collaboration with managers of adjacent transportation corridors. Stated that measures within this plan will reduce potential disturbance with the WMA and community lease land by providing guidance to avoid construction activity and vessel travel in these areas. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#169):** The assessment of Current Use includes the potential effects of the Project on the ability of Indigenous groups to access and use preferred harvesting areas. A quantitative risk assessment was conducted to determine the risk of potential accidents related to small vessels (EIS Section 30.0). A Land and Marine Traffic Management Plan is proposed to be included as part of the Environmental Management Program (EIS Section 33.0) to mitigate potential marine vessel traffic issues. **Addressed in PCU:** As requested by the Review Panel, the VFPA submitted the (PCU) on June 12, 2018, providing: • Detailed revised Project description, including a revised construction schedule; • Revised Project interaction matrix; • Preliminary details pertaining to the management and timing of dredging activities and the discharge of sediment-laden water; and • Revised assessment of environmental effects as required by the Project modifications. PCU Sections 1.0 and 2.0 describe the changes to the EIS, including updates to specific construction activities, the construction schedule, and relevant Project Description figures and appendices. In PCU Section 3.0, changes or effects resulting from the construction updates on intermediate and valued components (ICs and VCs) are described. Overall, these changes to the EA resulting from construction updates can generally be summarised as follows: • Reductions in potential adverse changes or effects on ICs, biophysical VCs, social VCs, and Current Use; and • Increases in positive interactions with socio-economic VCs. These beneficial changes to ICs and VCs occur at the level of interactions or potential effects, and in most cases are slight changes, and thus do not affect the overall conclusions made in the EIS, including proposed mitigation, residual effect characterisations, significance	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 33.0 Environmental Management Program 33.3.9 Land and Marine Traffic Management Plan **PCU**

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				determinations or cumulative effects, as applicable, with one exception. The only component predicted to have a change to residual effects is land and water use, with a reduction of a residual effect on access to Tsawwassen First Nation community lease lands from a measurable non-significant residual effect to a negligible residual effect, due to elimination of the ITP and associated activities.	
TFN-26.7	Stated that TFN is of the view that the waterlot due to be transferred to TFN should be identified on Project-related maps (and in the EIS) that identify TFN lands and use areas.	26-Nov-2014. Health & Aboriginal Rights Workshop – Tsawwassen First Nation 12-Feb-2015, Meeting	**26-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes.	**Addressed in EIS Section 32.0:** Tsawwassen First Nation water lots are identified and depicted in a map in the EIS Section 32.2.4.1, which discusses Tsawwassen First Nation land and water use.	**EIS** 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2.4.1 Tsawwassen First Nation
TFN-26.8	Concerned with impacts to eelgrass habitat for crabs and other species; it is noted the Project footprint is proposed for a very productive area where TFN fishers actively harvest.	27-Nov-2013, Community Meeting 26-Nov-2014. Health & Aboriginal Rights Workshop – Tsawwassen First Nation	**27-Nov-2013, Meeting:** Recorded comment for consideration by the Project team. **15-Jan-2014, Letter from the VFPA:** The VFPA acknowledges the need to understand potential Project-related effects. The marine vegetation and biofilm components of the EA will assess potential Project-related effects on eelgrass. The proposed scope of assessment for traditional land and resource use will take into account the potential for the Project to result in changes to harvesting opportunities and practices, and changes in other traditional uses of the land. The VFPA recognises continued consultation with Tsawwassen First Nation Crabbers and Elders will continue to help inform the studies. The VFPA is committed to share the results of this consultation with Tsawwassen First Nation. **26-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **19-Jul-2016, Workshop:** The VFPA hosted an Issues Workshop with Tsawwassen First Nation and presented on this concern, stating that the location or orientation of the footprint and the creation of a wave shadow behind the terminal creates ideal conditions for the growing of eelgrass. The VFPA noted this is why there's been rapid growth of eelgrass in the inter-causeway, as the causeways block waves. The VFPA stated that the	**Addressed in EIS Appendix 7.2-B (#68):** Potential effects on eelgrass habitat, as well as on crabs and other species that use eelgrass habitat, are described in the EIS. Eelgrass beds are highly productive habitats in the Roberts Bank ecosystem, serving numerous critical functions, such as food, shelter, and rearing habitat for numerous species. Eelgrass is a sub-component of the marine vegetation assessment. The assessment concludes that changes in productivity of eelgrass are predicted to be negligible (i.e., not measurable or detectable). Increases in productivity of eelgrass are anticipated with the implementation of standard management practices and environmental management plans, and the creation of onsite habitat. Approximately three hectares of native eelgrass will be established through transplants in the inter-causeway area. **Addressed in EIS Appendix 7.2-B (#165):** The assessment of Current Use includes evaluation of potential effects to crab harvesting related to changes in access. The assessment concludes that after the implementation mitigation, a negligible residual effect is anticipated. A determination of significance is not made on negligible residual effects, as the effect is not measurable or detectable.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 11.0 Marine Vegetation 11.6.3 Potential Effect – Changes in Productivity 11.7.2 Reduction and Off-setting Measures 12.0 Marine Invertebrates 12.6.3 Potential Effect – Changes in Productivity 12.7.2 Mitigation #1 for Direct Mortality 21.0 Marine Commercial Use 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Lands and Resources for Traditional Purposes 32.3 Potential Adverse Effects on Aboriginal and Treaty Rights and Related Interests Analysis

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			idea is not to protect eelgrass for the sake of eelgrass, but because of its importance to other species. There is also onsite habitat proposed to be built with the Project, and with this in mind, there is no effect predicted from the Project to eelgrass.		
TFN-26.9	Concerned with the loss of area within which TFN can exercise certain aspects of TFN culture, negatively impacting community identity and the ability to pass down knowledge.	19-Jul-2016, Issues Workshop - Musqueam First Nation / Tsawwassen First Nation #1	**19-Jul-2016, Workshop:** Responded that the interrelatedness of cultural heritage and intergenerational transfer to use of the environment, and the difficulty of quantifying or mitigating effects on them is recognised. Reference to additional information request AIR-12.04.15-29 regarding Physical and Cultural Heritage; it is noted the response provides additional information on how the VFPA approached this in the EIS. The approach taken looked at four indicators (access, availability and quality of resources, quality of experience); if there was an effect on any one of those four indicators, the inference was made that there could be an effect to cultural practices or heritage that are dependent upon access to or a certain quality of experience at culturally important locations or the availability or quality of culturally important resources. Effort was made to take a cautionary approach to this aspect of the assessment. For that reason, mitigation measures identified in relation to the four indicators were viewed as applying in the aggregate to address potential effects on use of lands and resources for traditional purposes, including potential associated effects on cultural heritage. Suggestion made to review the response, if Tsawwassen First Nation hasn't already done so. Request for feedback if Tsawwassen First Nation sees opportunities for improvement with regard to how cultural heritage is assessed.	**Addressed in response to IR10-22:** The VFPA's response to IR10-22, as requested by the Review Panel, further discusses the assessment of cultural heritage, potential disruptions or loss of ceremonial and cultural practices, as well as a potential disruption to sense of belonging, identity and spirituality.	**Information Requests** Response to Additional Information Request #29 (AIR-12.04.15-29 of CEAR Document #388) Response Sufficiency Information Request #22 (IR10-22)
TFN-26.10	Concerned with consideration of Treaty rights in the EIS, noting that TFN must defend all rights specified in the Tsawwassen First Nation Final Agreement, and not just those currently exercised: • Commented that the EIS should include species of emerging or potential future commercial fisheries, for example lingcod and	06-Jun-2014, Aboriginal Group VC Workshop #1 19-Jul-2016, Issues Workshop - Musqueam First Nation / Tsawwassen First Nation #1	**06-Jun-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 32.3.2.1. **19-Jul-2016, Workshop:** Recorded comment for consideration by the Project team.	**Addressed in EIS Section 32.3:** EIS Section 32.3.2.1 specifically acknowledges the Tsawwassen First Nation Final Agreement and considers potential Impacts on the Exercise of Treaty Rights – Tsawwassen First Nation, based on information provided to the VFPA by Tsawwassen First Nation on Tsawwassen's current and potential future use of lands and resources pursuant to treaty rights under the Tsawwassen First Nation Final Agreement, presented in EIS Section 32.2.4.1. For example, the VFPA notes that EIS Section 32.2.4.1 expressly refers to the "emerging commercial fisheries" provision in Tsawwassen First Nation Final Agreement, as well as the Tsawwassen's treaty right to harvest ground fish (e.g., rockfish, lingcod) for domestic purposes, even though that right had not yet been exercised since the agreement had come into effect in 2009. **Addressed in EIS Section 10.3.3:** As noted in EIS Section 10.3.3, productive potential is a key concept in relation to the RB Model (ecosystem model). The RB model was one of several lines of evidence used to assess potential Project effects, and other lines of evidence were used to address potential effects from construction phase activities.	**EIS** 10.3.3 Ecosystem Model Process 13.0 Marine Fish 13.5.2 Existing Conditions, Reef Fish 13.6 Future Conditions with the Project 16.0 Ongoing Productivity of Commercial, Recreational, and Aboriginal Fisheries 16.5 Existing Conditions 32.3 Potential Adverse Impacts on Aboriginal and Treaty Rights and Related Interests Analysis 32.3.2.1 Potential Impacts on the Exercise of Treaty Rights – Tsawwassen First Nation 32.3.3.1 Summary of Mitigation Measures for Potential Adverse Impacts on the Exercise of Asserted or Established Aboriginal and Treaty Rights

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	sockeye salmon. • Stated that in evaluating potential effects, the baseline should include the productive potential of the area, and not the current level of productivity.			**Addressed in response to IR10-26:** The VFPA's response to IR10-26, as requested by the Review Panel, discusses potential effects of the proposed Project on the reasonably foreseeable future use activities that have been identified by Indigenous groups, including those use activities linked to the exercise of treaty rights under the Tsawwassen First Nation Final Agreement, and how the VFPA expects those potential effects to be address through mitigation (further discussed in IR10-11 and IR10-12).	**Information Requests** Response to Sufficiency Information Request #26 (IR10-26)
TFN-26.11	Stated that the EIS Guidelines require the Proponent to include in the EIS information related to, "Aboriginal traditional territories, treaty lands, Indian reserve lands". The EIS (Appendices to Volume 1, Section 3.3.1) only includes a map of Tsawwassen Treaty Lands'. The EIS should include the boundaries for Tsawwassen Territory.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #231)	**30-Sep-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Agency did not request additional information for this item since there is already information on Tsawwassen Territory provided in the EIS in Section 3.3.1.1 and the inset of Figure 3-2."*	**Addressed in EIS Figure 32-1:** EIS Figure 32-1 shows Tsawwassen First Nation Traditional Territory and LAAs of Linked Biophysical VCs. **Addressed in response to IR1-22:** Figure IR1-22-2 in Appendix IR1-22-A in the VFPA's response to IR1-22 shows a map with the traditional territories of each Indigenous group as provided in the EIS and MSA, per the clarification received from the Review Panel on October 3, 2016 (CEAR Document #563).	**Information Requests** Response to Sufficiency Information Request #22 (IR1-22 of CEAR Document #897)

Table 27: Project Overview and Description

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-27.1	Concerned that the terminal will be used for coal.	28-Jan-2013, Meeting with Tsawwassen First Nation Advisory Council	**28-Jan-2013, Meeting:** Explained that RBT2 is proposed for containers only. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#6):** The proposed Project is a container terminal and does not include any coal-related elements. There are no plans to modify the Project to handle bulk oil or coal.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table
TFN-27.2	Asked whether the EIS would be revised to reflect a better alternative, if it were selected. Stated that TFN is of the view that the VFPA should be bound to implement improvements.	05-May-2015, Meeting	**05-May-2015, Meeting:** Explained that the RFP for a developer will go out in 2016 and the developer contract would include any stipulations (regarding drill type, etc.). The VFPA confirms that the CEA Agency would not be able to hold the VFPA to this contract. It is explained that the engineering in the EIS contains technology that is already dated, and the VFPA has stated throughout the EIS that the design may be improved. It is assumed that the VFPA will use newer technology where available and feasible, and the RFP process is the best way to implement this.	**Addressed in EIS Section 4.0:** EIS Section 4.0 describes the Project components as designed in the Preliminary Engineering phase and as assessed in this EIS. Final designs and construction methodology will be produced and determined by the chosen Terminal Operator Concessionaire and Infrastructure Developer upon Project approval, and as such may vary slightly from those described in this section. Any design or construction changes will be required to meet any commitments made by [the VFPA], or conditions stipulated during the EA and regulatory review process. **Addressed in PCU:** As requested by the Review Panel, the VFPA submitted the PCU on June 12, 2018, providing: • Detailed revised Project description, including a revised construction schedule; • Revised Project interaction matrix; • Preliminary details pertaining to the management and timing of dredging activities and the discharge of sediment-laden water; and • Revised assessment of environmental effects as required by the Project modifications. PCU Sections 1.0 and 2.0 describe the changes to the EIS, including updates to specific construction activities, the construction schedule, and relevant Project Description figures and appendices. In PCU Section 3.0, changes or effects resulting from the construction updates on intermediate and valued components (ICs and VCs) are described. Overall, these changes to the EA resulting from construction updates can generally be summarised as follows: • Reductions in potential adverse changes or effects on ICs, biophysical VCs, social VCs, and Current Use; and • Increases in positive interactions with socio-economic VCs. These beneficial changes to ICs and VCs occur at the level of interactions or potential effects, and in most cases are slight changes, and thus do not affect the overall conclusions made in the EIS, including proposed mitigation, residual effect characterisations, significance determinations or cumulative effects, as applicable, with one exception. The only component predicted to have a change to residual effects is land and water use, with a reduction of a residual effect on access to Tsawwassen First Nation community lease lands from a measurable non-significant residual effect to a negligible residual effect, due to elimination of the ITP and associated activities.	**EIS** 4.0 Project Description **PCU**
TFN-27.3	Stated that in Section 4.4.1 of the EIS a full description of post- construction clean-up and on-site grounds reclamation is required.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #231)	**30-Sep-2015, Letter from the CEA Agency to Tsawwassen First Nation:** *"The Agency has requested additional information on post-construction clean-up and on-site grounds reclamation in its letter of July 31, 2015 to [the VFPA] (page 9, #17).*	**Addressed in Response to IR-7.31.15-17:** The VFPA's response to IR-7.31.15-17 presents an overview of post-construction clean-up and on-site grounds reclamation. EIS Section 4.4.1.19 identifies the post-construction clean-up required. The Project to a large degree will be constructed using marine-based equipment to develop the new terminal and widened causeway land mass. Once the land mass is completed, the marine-based equipment will move away from the Project site, requiring no further clean-up. Construction infrastructure used in this land development, such as the temporary barge ramps, the ITP, the ITP pipelines, the DAS pipelines, and temporary causeway aggregate storage, will require removal, disposal, re-instatement to pre-existing conditions, surveying, or surface development as the case may be for the individual items stated in EIS Section 4.4.1.19.	**EIS** 4.4.1.19 Decommissioning of Temporary Construction Infrastructure **Information Requests** Response to Information Request #17 (IR-7.31.15-17 of CEAR Document #314)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				Laydown areas, office trailers and facilities, construction equipment parking, and other construction-related infrastructure are all anticipated to be located on the developed land. This land will have surface operation infrastructure installed and placed into operation in a phased manner from the east to the west side of the terminal. Therefore, there will be ample space for construction infrastructure within the Container Yard area prior to full terminal operation, thus requiring no further clean-up or reclamation when the Project construction is complete, aside from moving any temporary construction trailers, materials, and mobile equipment off from the site, and repairing any disturbed Container Yard areas with the proper pavement material required for the area.	

Table 28: Social and Economic Setting

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-28.1	Stated that the decision to proceed with the Project considers financial and economic costs to the proponent, but not the social and economic costs to the community (i.e., Area E gillnetters), or the costs to the environment. Stated that if the VFPA were to be responsible for all costs associated with development, an alternatives analysis may come to a different determination.	07-Oct-2014, Preliminary EIS Workshop #1	**07-Oct-2014, Workshop:** Explained that first economic feasibility is looked at, typically from a constructability aspect, but also from the perspective of the economic cost of doing business, which to some extent includes having to mitigate against economic impacts. Then feasibility is looked at by comparing the effects of alternatives on different VCs (refers to the six bullets on slide 4 of the Alternative Means presentation: marine vegetation, marine invertebrates, marine fish, coastal birds, marine mammals, human health), to minimise environmental impacts. Due to Project location, those are the components that were focused on as it relates to economic impacts. The preferred alternative was chosen partially based on avoidance of potential environmental impacts. So as a result, it is assumed that there's a lesser economic impact, but the Project team didn't go so far as to quantify this impact.	**Additional information provided by response from the VFPA [29-Apr-2015, Letter from the VFPA to the CEA Agency (CEAR Document #187)]:** "The EIS submitted by [the VFPA] to the CEA Agency on March 27, 2015, in response to the original EIS Guidelines issued January 7, 2014, is intended to meet both federal and provincial requirements. Attached is a Table of Concordance indicating where the matters set out in s. 18 of the Updated EIS Guidelines are addressed in the EIS. We confirm that [the VFPA] is of the view that we have adequately addressed provincial socio-economic matters and that additional information in response to s. 18 of the Updated EIS Guidelines is not required." **Additional information provided by the VFPA:** RBT2 plays an important role in being ready to support Canadian businesses shipping goods to and from market, and in ensuring we can keep Canada open for trade with growing economies around the world into the future. The project will create opportunities for Indigenous groups, including training, employment opportunities and project contracting opportunities. Roberts Bank and the surrounding area continue to attract investment in goods movement infrastructure, demonstrating a recognition of the continued growth anticipated for the Roberts Bank gateway. The project would be a significant economic generator for the region. The project will provide for community benefits, and the port authority will work with local governments and residents to help deliver initiatives of importance to them should the project be approved. Through environmental studies, the project has made a significant contribution to scientific knowledge of the Roberts Bank ecosystem and many species of interest. These studies are openly shared with other organisations working toward goals of environmental protection and stewardship.Consistent with the *Updated EIS Guidelines*, adverse environmental and socio-economic effects are considered and assessed as part of the EA of the Project. In addition, ultimately environmental effects are considered in the final investment decision as economic feasibility of the Project depends in part on the costs to mitigate potential adverse effects.	**EIS** 5.0 Alternative Means of Carrying out the Project 5.3.1 Increase Capacity and Efficiency of Existing Container Terminals within VFPA Jurisdiction 7.0 Engagement and Consultation 7.2.1 Aboriginal Groups Engagement and Consultation, Engagement and Consultation Process Overview 18.0 Social and Economic Setting 19.0 Labour Market 20.0 Economic Development 21.0 Marine Commercial Use 22.0 Local Government Finances 23.0 Services and Infrastructure 24.0 Outdoor Recreation 25.0 Visual Resources 26.0 Land and Water Use 27.0 Human Health 28.0 Archaeological and Heritage Resources 34.2 Benefits of the Project
TFN-28.2	Commented on the Tsawwassen First Nation Community and Socio-Economic Assessment Plan and expressed concern that there are no valued components that touch on culture, health and/or spiritual elements in the Tsawwassen First Nation Community and Socio-Economic Assessment Work Plan. Expressed desire for the socio-economic assessment team to work closely with the Traditional Use assessment team to consider findings in both studies.	13-Dec-2013, Email 24-Apr-2014, ITK Meeting with Elders	**21-Jan-2014, Letter from the VFPA:** The VFPA revised the Tsawwassen First Nation Community and Socio-Economic Assessment Work Plan to indicate that the cultural, health and/or spiritual elements will be addressed in the Traditional Land and Resource Use, Heritage and Archaeology, and Human Health components. In addition, Golder provided examples of Valued Components and Topics for the Community Assessment (Section 5.2, Table 1), which are to be confirmed and/or modified by Tsawwassen First Nation based on the community's economic and social interest and concerns with respect to the Project. **24-Apr-2014:** Recorded comment for consideration by Project team.	**Addressed in EIS Section 27.0:** EIS Section 27.0 presents an assessment conducted to determine potential Project-related effects on human health, considered a VC. The results of the human health assessment were considered in the assessments of marine commercial use, outdoor recreation, and Current Use. **Addressed in EIS Section 32.0:** Cultural components are addressed in EIS Section 32.0. **Addressed in response to IR10-22:** The VFPA's response to IR10-22, as requested by the Review Panel, further discusses the assessment of cultural heritage, potential disruptions or loss of ceremonial and cultural practices, as well as a potential disruption to sense of belonging, identity and spirituality. **Additional information provided by the VFPA:** In developing the EIS and the MSA, the VFPA's technical teams were engaged in considerable interdisciplinary collaboration, including between socio-economic teams and Current and Traditional Use experts. This is evidenced by overlapping content throughout the assessment (specifically between sections in EIS Volumes 4 and 5) as well as multiple cross-references throughout. **Further information provided by the VFPA:** Tsawwassen First Nation provided comments on the draft *Existing Socio-Economic Conditions of Tsawwassen First Nation Community* on 09-Jan-2015. The VFPA reviewed Tsawwassen First Nation's comments and requested changes and provided Tsawwassen First Nation with a revised draft on 21-Jan-2015.	**EIS** 27.0 Human Health 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests **Information Requests** Response to Sufficiency Information Request #22 (IR10-22)

Tsawwassen First Nation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			09-Dec-2014, Email: The VFPA provided Tsawwassen First Nation with a draft copy of *Appendix 18-A Existing Socio-Economic Conditions of Tsawwassen First Nation Community* for review and comment.		

Table 29: Surficial Geology and Marine Sediment – Intermediate Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-29.1	Asked whether the local study area includes the dredge disposal site, and how changes in elevation are accounted for.	08-Oct-2014, Preliminary EIS Workshop #2	**08-Oct-2014, Workshop:** Responded that dredging and disposal of the dredgeate are examined in the EIS. Their study area is different because they will be distributing that sediment in deeper water. **27-Jun-2017, Letter from the VFPA:** Stated that as a result of work undertaken over the past year to address concerns raised by Tsawwassen First Nation and other Indigenous groups related to Dungeness crabs and DAS, and to reduce potential environmental effects from the Project, the VFPA has determined that the ITP is no longer required as a temporary storage location to support project construction. The elimination of the ITP, along with other changes will result in a Project that will not require a DAS permit.	As requested by the Review Panel, the VFPA submitted the PCU on June 12, 2018, providing: • Detailed revised Project description, including a revised construction schedule; • Revised Project interaction matrix; • Preliminary details pertaining to the management and timing of dredging activities and the discharge of sediment-laden water; and • Revised assessment of environmental effects as required by the Project modifications. PCU Sections 1.0 and 2.0 describe the changes to the EIS, including updates to specific construction activities, the construction schedule, and relevant Project Description figures and appendices. In PCU Section 3.0, changes or effects resulting from the construction updates on ICs and VCs are described. Overall, these changes to the EA resulting from construction updates can generally be summarised as follows: • Reductions in potential adverse changes or effects on ICs, biophysical VCs, social VCs, and Current Use; and • Increases in positive interactions with socio-economic VCs. These beneficial changes to ICs and VCs occur at the level of interactions or potential effects, and in most cases are slight changes, and thus do not affect the overall conclusions made in the EIS, including proposed mitigation, residual effect characterisations, significance determinations or cumulative effects, as applicable, with one exception. The only component predicted to have a change to residual effects is land and water use, with a reduction of a residual effect on access to Tsawwassen First Nation community lease lands from a measurable non-significant residual effect to a negligible residual effect, due to elimination of the ITP and associated activities.	**EIS** 4.0 Project Description 4.3 Project Schedule **PCU**
TFN-29.2	Asked where dissolved oxygen originates, whether it is naturally occurring, and how it relates to water quality.	08-Oct-2014, Preliminary EIS Workshop #2	**08-Oct-2014, Workshop:** Responded that because Roberts Bank is such a dynamic environment, there is wave mixing and oxygen is pounded into the water. Lack of oxygen occurs in stagnant waters, where oxygen consuming organisms deprive the water, and without wind mixing oxygen depletion occurs. Example given of agricultural ditches in Delta that are largely stagnant and reach elevated temperatures in the summer that no longer support salmon because the oxygen levels are too low.	**Addressed in EIS Section 9.7.6:** The characterisation of existing conditions for marine water quality are described in EIS Section 9.7.6 for a range of parameters, including temperature, salinity, dissolved oxygen and pH, total suspended solids and turbidity, nutrients, and contaminants (including trace elements such as metals and metalloids).	**EIS** 9.7 Water Quality 9.7.6 Existing Conditions

Table 30: 2004 TFN-VFPA Roberts Bank Development Memorandum of Agreement (MOA)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-30.1	Stated that TFN does not regard the MOA as discharging the federal and provincial Crowns' duties to consult TFN on the Project as a result of the project as now proposed being substantially different from the project described in the MOA, and because the VFPA delayed long beyond the parties' expectations in proceeding with an application to construct a second terminal.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following information.	Additional information provided by the VFPA: The MOA was signed in 2004. The Deltaport Third Berth project was constructed between 2006 and 2009 with full completion and operation in 2010. In 2011 engagement with the Tsawwassen First Nation on the Roberts Bank Terminal 2 project commenced. The "Terminal 2" project referred to in the MOA is the same Terminal 2 project that is currently proposed. The VFPA's position is that there been no delay in proceeding with an application to construct a second terminal. The Terminal 2 project follows on the development of the Deltaport Third Berth project and there is no timeline or expiry date for Terminal 2 indicated or implied in the MOA. Further, with respect, the current proposal is not significantly different from the project described in the MOA.	**EIS** 7.0 Engagement and Consultation 7.2.1 Engagement and Consultation Process Overview **2004 TFN-VFPA Roberts Bank Development Memorandum of Agreement:** http://www.tsawwassenfirstnation.com/pdfs/TFN-About/Information-Centre/Agreements/TFN_VPA_Memorandum_of_Agreement.pdf
TFN-30.2	Concerned that the proposed design in the EIS has a greater impact on gravid female Dungeness Crabs than that referenced in the 2004 MOA. Requested a quantitative estimate of the difference in crab habitat that may have been impacted by the previous footprint and configuration, as compared to the configuration set out in the EIS.	28-Oct-2016, Letter to Panel (CEAR Document #650)	The VFPA has reviewed this letter and provides the following information **27-Jun-2017, Letter from the VFPA:** Stated that as a result of work undertaken over the past year to address concerns raised by Tsawwassen First Nation and other Indigenous groups related to Dungeness crabs and disposal at sea (DAS), and to reduce potential environmental effects from the Project, the VFPA has determined that the ITP is no longer required as a temporary storage location to support project construction. The elimination of the ITP, along with other changes will result in a Project that will not require a DAS permit.	**Addressed in EIS Section 12.0:** EIS Section 12.0 presents an effects assessment for marine invertebrates. During construction and operation, the Project is expected to result in a net decrease in marine invertebrate productivity, both before and after mitigation is implemented. Increases in productivity of infaunal and epifaunal invertebrate communities and decreases in productivity for bivalve shellfish, Dungeness crab and orange sea pens are predicted. Short-term productivity losses are due to direct mortality and losses of available habitat within the Project footprint. Productivity decreases can be partially mitigated through the implementation of environmental management plans, including crab salvages and transplanting of orange sea pens, and through the creation of eelgrass, intertidal marsh, mudflat and sandy gravel beach habitats. While the Project is predicted to cause losses of productivity of bivalve shellfish, Dungeness crabs and orange sea pens, the scale of change is minor in the context of natural variability and would not compromise the population integrity or ecological function. The assessment concludes there are no significant adverse residual effects from the Project to marine invertebrates. The Project is not expected to result in any incremental adverse cumulative effects to marine invertebrates. Addressed in IR4-23: As noted in the VFPA's response to IR4-23, a number of mitigation measures were proposed to avoid, reduce, or offset the potential effects on gravid female crabs. The key mitigation measure proposed for gravid crabs	**EIS** 12.0 Marine Invertebrates Effects Assessment **Information Requests** Response to Sufficiency Information Request #23 (IR4-23 of CEAR Document #1051) **PCU**

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				is adherence to DFO's sensitive timing window that prevents Project construction activities from occurring at depths below -5 m CD (chart datum) from October 15 to March 30, over the brooding season. A crab salvage program is also proposed to minimise potential mortality on crabs, including gravid females. While gravid females tend to fast during the brooding period, Tsawwassen First Nation harvesters report that gravid females are regularly caught in traps in the local assessment area; thus, it is likely that some gravid females can be baited, enabling relocation out of Project footprint areas. In addition, onsite habitat offsetting (e.g., creation of eelgrass as described in EIS Section 12.7.4), while not specific to the gravid life stage, will increase Dungeness crab productivity over the long term. Follow-up monitoring will be undertaken to determine the accuracy of predicted environmental effects on crabs. **Addressed in PCU:** As requested by the Review Panel, the VFPA submitted the PCU on June 12, 2018, providing: • Detailed revised Project description, including a revised construction schedule; • Revised Project interaction matrix; • Preliminary details pertaining to the management and timing of dredging activities and the discharge of sediment-laden water; and • Revised assessment of environmental effects as required by the Project modifications. PCU Sections 1.0 and 2.0 describe the changes to the EIS, including updates to specific construction activities, the construction schedule, and relevant Project Description figures and appendices. In PCU Section 3.0, changes or effects resulting from the construction updates on intermediate and valued components (ICs and VCs) are described. Overall, these changes to the EA resulting from construction updates can generally be summarised as follows: • Reductions in potential adverse changes or effects on ICs, biophysical VCs, social VCs, and Current Use; and • Increases in positive interactions with socio-economic VCs. These beneficial changes to ICs and VCs occur at the level of interactions or potential effects, and in most cases are slight changes, and thus do not affect the overall conclusions made in the EIS, including proposed mitigation, residual effect characterisations, significance determinations or cumulative effects, as applicable, with one exception. The only component predicted to have a change to residual effects is land and water use, with a reduction of a residual effect on access to Tsawwassen First Nation community lease lands from a measurable non-significant residual effect to a negligible residual effect, due to elimination of the ITP and associated activities.	

Tsawwassen First Nation

Table 31: Traffic / Transportation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-31.1	Stated that with all these road improvements, the traffic will increase. Asked if there will be a four lane x-section for Delta Port Way. Stated that traffic is already congested. Asked if the overpass that is planned is connected to Delta Port Way. Asked if there will be two lanes in either direction. Asked if SFPR (South Fraser Perimeter Road) will help reduce the traffic congestion. Asked how the traffic on Delta Port Way will become less. Asked about the new overpasses that the VFPA identified.	28-Jan-2013, Meeting with Tsawwassen First Nation Advisory Council	**28-Jan-2013, Meeting:** Stated that the VFPA believes it will be four lanes, but will confirm. Stated that trucks will connect to Delta Port Way to SFPR to Hwy 1 to Calgary. The improvements will reduce Hwy 17 congestion. Committed to get back to Tsawwassen First Nation with a response on the configuration when the EIS is prepared. **01-Apr-2015, Letter from the VFPA:** Provided an advance copy of the EIS for the Project. [EIS Section 4.2.2.2 explains the causeway road additions and improvements.]	**Addressed in EIS Section 4.2.2.2:** The existing Roberts Bank Way North will remain two lanes wide from the Deltaport Terminal, Road and Rail Improvement Project (DTRRIP) overpass to the new RBT2 overpass to allow access to and from the Roberts Bank terminals. It will connect to a new three-lane access road that will lead to the new marine terminal. These proposed road improvements are illustrated in EIS Figure 4-7. The new RBT2 overpass will separate road traffic bound for the Project from traffic bound for Westshore Terminals, or Deltaport Terminal's Gate 2. The RBT2 overpass will be built on the north side of the existing causeway and extend onto the new widened causeway. It will span the North Yard tracks leading to Westshore Terminals and connect Roberts Bank Way North to the RBT2 access road. The three-lane RBT2 access road will follow the rail alignment that connects to the IYs. This access road has been configured with two westbound lanes and one eastbound lane. A gravel emergency access road will be located on the north side of the widened causeway to allow for uninterrupted access to the Roberts Bank terminals in the unlikely event that the main causeway road, Deltaport Way, is blocked (EIS Figure 4-6). Located within a 10-m-wide right-of-way, the 8-m-wide emergency access road will allow for two-way traffic on a gravel surface. This gravel road will tie in to the existing Deltaport Way at the east end of the causeway via emergency at-grade crossings over the rail tracks. This road will also be used for maintenance purposes with restricted access at the at-grade crossings.	**EIS** 4.0 Project Description 4.2.2.2 Causeway Road Additions and Improvements Appendix 4-D Roberts Bank Traffic Data Matrix
TFN-31.2	Asked if there will be places for the trucks to park on Delta Port Way.	28-Jan-2013, Meeting with Tsawwassen First Nation Advisory Council	**28-Jan-2013, Meeting:** Explained that truck staging (parking) is being addressed as part of the design. **01-Apr-2015, Letter from the VFPA:** Provided an advance copy of the EIS. [EIS Section 4.2.2.3 addresses truck staging.]	**Addressed in EIS Section 4.4.2.3:** Inbound trucks may also be staged in existing designated staging lanes along the existing causeway roads, or along the new RBT2 access road's second inbound lane if terminal conditions require this staging.	**EIS** 4.0 Project Description 4.4.2.3 Widened Causeway Operation
TFN-31.3	Asked about the traffic congestion at the tunnel. Concerned about road and rail between Highway 17 (and vicinity in the case of the BC Rail Line) and the proposed terminal. Stated that transportation along that corridor must be within the scope of the environmental assessment for the Proposed Project. Concerned with the impacts of increased rail traffic on the local community and TFN traditional territory. Asked whether this is examined in the EIS.	28-Jan-2013, Meeting with Tsawwassen First Nation Advisory Council 16-Oct-2013, Letter to the CEA Agency 26-Nov-2014, Health & Aboriginal Rights Workshop - Tsawwassen First Nation	**28-Jan-2013, Meeting:** Stated that the VFPA's work and SFPR does not address congestion at the tunnel. **26-Nov-2014, Workshop:** Stated that shipping and rail and truck transport is being assessed in the context of the Project area and the VFPA's jurisdictional area. Noted that the Gateway Transportation Collaboration Forum is a separate initiative the VFPA is involved with to address transportation issues in the region. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included Appendix EIS 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#216):** As defined in the *EIS Guidelines*, the scope of the Project includes marine, road, and rail transportation within the VFPA's jurisdiction. The scope of the assessment is the potential effects of the Project components and activities included within the scope of the Project wherever they occur, including effects that extend beyond the VFPA's jurisdiction. The scope of assessment is different for the various components being assessed, depending on the range of potential effects for each component. The effects of truck and train traffic beyond the Roberts Bank causeway is not within the scope of the EA as defined by the *EIS Guidelines*. However incremental truck traffic travelling outside of VFPA jurisdiction, but within the assessment areas of various VCs, is an activity considered in the assessment of cumulative effects.	**EIS** 4.0 Project Description Appendix 7.2-B Aboriginal Groups Interests and Issues Table 8.0 Effects Assessment Methods Table 8-8 Project and Activity Inclusion List **Gateway Transportation Collaboration Forum** www.vancouvergateway.ca/

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-31.4	Requested that container trucks stop using community roads. Concerned with truck accidents and level of police patrol in the area to deal with trucks coming off Delta Port Way. Suggested that the VFPA to speak with Delta police and RCMP regarding truck accidents.	18-Nov-2013, Community Meeting	**18-Nov-2013, Meeting:** Committed to follow-up with concern. **15-Jan-2014, Letter from the VFPA:** *"Thank you for making us aware of your concern. The VFPA Operations is in regular contact with the trucking community and will remind them to be mindful of their behaviour when exiting Deltaport Way.* *Container trucks may be forced to use alternate roads, as a detour route, in the event of an incident on Deltaport Way or the Causeway.* *Please advise the VFPA in the event that there is a persistent use of community roads via phone: 604-665-9004 or e-mail: community.feedback@portvancouver.com."*		
TFN-31.5	Asked about truck safety inspection facilities, and where one would be located.	27-Nov-2013, Community Meeting	**27-Nov-2013, Meeting:** Committed to follow-up with a response to question. **15-Jan-2014, Letter from the VFPA:** *"Truck inspection areas and/or facilities are the responsibility of the BC Ministry of Transportation and Infrastructure. Any questions regarding current or future plans for truck safety inspection facilities should be directed to them.* *To contact the BC Ministry of Transportation and Infrastructure: http://www.gov.bc.ca/tran/contacts.html.* *This is a BC Ministry of Transportation and Infrastructure Commercial Vehicle Safety and Enforcement (CVSE) issue. In general, a commercial vehicle other than a bus, taxi or logging truck having a licensed gross vehicle weight of more than 8,200 kg, but equal to or less than 17,300 kg requires an inspection every 12 months at Designated Inspection Facilities (DIF) or Preventative Maintenance Facilities (PMP) throughout the province."*		

Table 32: Underwater Noise – Intermediate Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-32.1	Concerned about adverse effects of underwater noise on biota in the Salish Sea. Asked how underwater noise affects organisms identified by TFN to be of interest (fish, bivalves, etc.). Requested information on mitigation measures. Requested to determine whether sockeye can be characterized in the same way as the other indicator species to provide confidence in the assessment.	16-Oct-2013, Letter to the CEA Agency 07-Oct-2014, Preliminary EIS Workshop #1 08-Oct-2014, Preliminary EIS Workshop #2 28-Oct-2014 Preliminary EIS Workshop #3 19-Jul-2016, Issues Workshop – Musqueam First Nation / Tsawwassen First Nation #1	**07-Oct-2014, Workshop:** Stated that noise will be addressed at tomorrow's presentation. **08-Oct-2014, Workshop:** Stated that unfortunately this presentation doesn't include the list of the proposed mitigations around noise; those will be in other chapters, such as Human Health. A monitoring study is one of the proposed activities, essentially follow up monitoring to measure the noise levels in the future, for comparison with our predictions. If predictions turn out to be inaccurate, the plan would be to work with the responsible parties to see what the sources of noise are, and what can be done to reduce them. The nature of a quantitative cumulative change analysis is speculative, and it is difficult to predict exactly what the noise contribution from other projects and traffic will be. **28-Oct-2014, Workshop:** Responded that the purpose of this presentation is to describe and characterise noise; discussions about potential effects on VCs will be in each of those VC presentations. Confirmed that underwater noise is a potential effect to marine fish, and noted all of the marine fish sub-components are being evaluated in the context of underwater noise. Reviewed proposed mitigation measures for the operation phase, noting there is none proposed because the residual effects are anticipated to be short-term and reversible. Noted however that the Port is initiating a regional program called ECHO, and inviting a number of stakeholders, shippers, vessel traffic operators to take part, to try to address potential cumulative effects of underwater noise on marine mammals. **19-Jul-2016, Workshop:** The VFPA hosted an issues workshop on the effects of noise on marine fish. The VFPA stated: Bullet (b) [slide 5] relates to concerns about increased underwater noise from ships redirecting fish away from Canoe Passage. That pathway of effect was a focal point in the EIS. We concluded that underwater noise from ships wouldn't impact salmon. This is because salmon aren't particularly sound-sensitive (unlike herring or eulachon). We engaged underwater acousticians and did modelling and used two thresholds in the noise assessments. The first threshold considers whether the noise would cause mortality or injury, and the second considers behaviour (i.e. salmon usually behave a certain way, but as a result of noise could there be a response that results in a	**Addressed in EIS Appendix 7.2-B (#61):** The scope and methods of the underwater noise study are summarised in the EIS section, and detailed in the supporting appendix. Underwater noise considers the level of underwater sound in the marine environment. An assessment was undertaken to determine potential changes in underwater noise as a result of the Project and focused on construction and operation activities that would produce underwater noise. Modelling was undertaken to predict future underwater noise as a result of construction activities, such as dredging, pile driving, vibro-densification, and movements of support vessels, and operation activities, such as movements of container ships and tug boats associated with terminal approach and departure, and berthing and unberthing. The assessment concludes that: • Underwater noise levels during construction are predicted to be comparable on average to existing levels measured at Roberts Bank, with the exception of some periods when certain activities, such as dredging, pile-driving, vibro-densification, or construction support vessel movement, would occur. • Overall, average underwater noise from Project construction and operation activities is expected to be comparable to average existing levels of underwater noise due to existing high levels, but will at times exceed existing conditions. Underwater noise related to conservative levels of Project commercial vessel movements is predicted to increase over existing underwater noise levels for only approximately 3% of a year for vessel berthing and unberthing, and for approximately 2% of a year for vessel approach and departure. • Future cumulative increases in commercial vessel traffic in the region are expected to make a relatively small incremental contribution to overall underwater noise levels. This prediction reflects the existing high levels of vessel traffic within the study area and the already-dominant contribution of commercial vessel traffic noise to the acoustic environment. The results of the underwater noise assessment were considered in the assessments of marine fish, marine mammals, and coastal birds. An interaction between Project-related underwater noise and marine invertebrates is not anticipated, and therefore was not assessed. **Addressed in response to IR5-26:** The VFPA's response to IR5-26 provides further justification for the use of the 90 dBht standard in the assessment of behavioural effects of underwater noise on juvenile Chinook and chum salmon (the representative species of sockeye). **Additional information provided by the VFPA:** With regard to concerns related to at-risk whales in our region, the port authority developed the ECHO Program which is aimed at better understanding and managing the impact of shipping activities, including underwater noise, on at-risk whales throughout the southern coast of B.C. The long-term goal of the ECHO Program is to develop mitigation measures that will lead to a quantifiable reduction in potential threats to whales as a result of shipping activities.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 9.8 Underwater Noise 9.8.2 Assessment of Purpose and Approach 9.8.6 Underwater Noise, Methods Appendix 9.8-A Construction and Terminal Activity Underwater Noise Modelling Study Technical Report Appendix 9.8-B Regional Commercial Vessel Traffic Underwater Noise Modelling Study Technical Report 13.0 Marine Fish 13.6 Future Conditions with the Project 14.0 Marine Mammals 14.6 Future Conditions with the Project 15.0 Coastal Birds 15.7 Future Conditions with the Project **Information Requests** Response to Sufficiency Information Request #26 (IR5-26 of CEAR Document #1153) https://www.portvancouver.com/environment/water-land-wildlife/marine-mammals/echo-program

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			change in that behaviour). Modellers had mapped out Project activities and modelled areas with those thresholds in place. For salmon there's no Project activity that will see the injury or mortality threshold being met. For salmon, the behavioural threshold wasn't exceeded either. We propose to have excellent mitigation measures in place when it comes to noise. The juvenile salmon timing window (enforced by DFO) prevents project works and activities from occurring between March 1 and August 15 to protect juvenile outmigration and rearing. That's been written into the EIS and construction schedule. There is also a noise management plan that would involve monitoring to see what any effects might be, and make adjustments accordingly. Bubble curtains can dampen source levels and the attenuation of noise. With mitigations, noise was deemed not to be a pathway of effect on salmon. In terms of what the VFPA knows about how fish hearing is determined, it has to do with whether their swim bladder is connected to the inner ear, which is something that occurs more with forage fish. Morphologically, salmon don't have that. The VFPA will take this away and look into it more to see if there's anything specific around sockeye.		

Tsawwassen First Nation

Table 33: Visual Resources – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
TFN-33.1	Concerned about potential adverse effects of light pollution and visual aesthetics of the Proposed Project.	16-Oct-2013, Letter to the CEA Agency	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Appendix 7.2-B (#123):** The visual resources assessment included both daytime and nighttime components and was based on the *B.C. Visual Landscape Inventory* guidelines. The daytime component was based on the character and extent of visual changes as a result of the Project. The nighttime component focused on changes in light trespass and sky glow. While the prominence of port-related structures is expected to increase from several viewscapes, the Project is not expected to result in a change in the overall quality of daytime visual resources, as the expected changes are consistent with the character of existing views of port facilities. Mitigation related to lighting design and operation, such as directing light only to where it is required, and use of a centralised light control system, is expected to substantially reduce adverse effects on nighttime visual resources. However, the visibility of more light sources at night would not be fully mitigated, and would be a non-significant residual adverse effect for sites in the southern Gulf Islands. In consideration of the minor level of overall change to the viewscape and the similarity of the Project to the existing viewscape, the residual effect of the Project alone on visual resources is considered not significant. **Addressed in EIS Section 9.4:** As noted in EIS Section 9.4.7, a process is underway to change the current outdoor lighting fixtures at the Deltaport Terminal to light-emitting diodes (LEDs). LEDs are more directional and easier to control in terms of where light is focused. It is anticipated that the change to LEDs will reduce both light trespass and sky glow from the Deltaport Terminal, provided good lighting design practices are followed (specifically, the use of full cut-off light fixtures to limit up-light and only lighting areas that are required to be lit). The lighting on one crane at Deltaport has been fully replaced with LED lights, offering a point of comparison with the older lights. Suggested mitigations for the Project were considered in the effects assessment.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 9.4 Light

APPENDIX IR10-01-C2

MUSQUEAM FIRST NATION: ISSUES, VIEWS, AND CONCERNS RELATED TO THE PROPOSED PROJECT AND MARINE SHIPPING ASSOCIATED WITH THE PROJECT

Table 1: Air Quality – Intermediate Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-1.1	Concerned about ship emissions as they live in a confined area and ship numbers will increase with T2. Concerned with air quality impacts from existing port infrastructure.	14-Nov-2012, Meeting 16-Jul-2013, Meeting 17-Dec-2013, Meeting	**14-Nov-2012, Meeting:** Provided information on new regulations that will regulate fuels that can be burned by ships within a certain proximity to the mainland. **16-Jul-2013, Meeting:** Stated that cumulative effects are part of the EA; includes air quality, noise, light, etc. Stated that [more modern] ships are larger, cleaner, and slower so burn less fuel. **17-Dec-2013, Meeting:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the Vancouver Fraser Port Authority's (VFPA) response.	**Addressed in EIS Appendix 7.2-B (#42):** An assessment was carried out to predict potential changes in air quality as a result of the Project. The results of the air quality assessment were used in the assessments of human health and Current Use of land and resources for traditional purposes (Current Use). The assessment modelled Project-related emission sources during the construction phase, and fuel combustion during the construction and operation phases, and compared them to modelled existing conditions and future expected conditions. Existing conditions considered emissions from marine vessels, trains, trucks, vehicles, and equipment from the existing Westshore Terminals, Deltaport Terminal, and BC Ferries Terminal, while emissions from industrial, commercial and residential sources within Delta were represented through measured air quality levels in Tsawwassen. A general trend of decreasing concentrations of contaminants has been observed and is expected in the Lower Fraser Valley for some criteria air contaminants, as well as for some trace organic contaminants. Coal dust is included in the assessment of air quality in existing conditions, in the future with the Project, and in the cumulative effects assessment. Hypothetical maximum emissions scenarios were used to conservatively estimate existing conditions and potential changes from the Project. Estimated emissions and predicted ambient concentrations did not account for the inclusion of shore power as part of the Project, which is expected to decrease future emissions from ships at berth ultimately improving air quality. The assessment concludes that: • Air quality will improve in the future, with or without the Project, as a result of improvements in engine technologies and the use of cleaner fuels. • Cumulative changes, incorporating the Project and other certain and reasonably foreseeable projects and activities, are predicted to be small relative to expected future ambient air quality levels. • Project construction activities are predicted to cause a small increase in concentrations of some contaminants. • Criteria air contaminant (i.e., carbon monoxide, nitrogen oxides, sulphur dioxide, particulate matter, and ground-level ozone) and trace organic contaminant (i.e., formaldehyde and other contaminants related to fuel combustion) levels are predicted to be below air quality criteria on land, with limited exceptions. • The Project is expected to have a negligible effect on future ozone levels and to increase greenhouse gas emissions (i.e., carbon dioxide, methane, and nitrous oxide). • Although Project activities would emit black carbon, black carbon is expected to decrease in the future with the Project due to equipment fleet turnover at existing Roberts Bank terminals to newer engines that meet more stringent emission standards for particulate matter. The Project is not expected to result in any significant adverse effect on human health, including from changes in air quality. During operation, it is unlikely that Project-related exposures to air emissions would result in health effects. The only residual effect associated with air quality changes would be experienced by individuals on the water near the terminal during construction due to short-term and infrequent dust generation. The benefits of existing initiatives are realised in the existing emissions monitored at local air quality stations in Metro Vancouver. Future benefits to air quality, such as improvements in fuel, are described in the EIS based on their anticipated level of benefit to future air quality emissions.	**Environmental Impact Statement (EIS, CEAR Document #181)** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 9.0 Physical Setting 9.2.5 Air Quality, Methods Appendix 9.2-A Air Quality Study Main Report Appendix A - Emissions Inventory Appendix B – Existing Air Quality Appendix C - Air Dispersion Modelling Appendix F - Ships Underway Appendix H – Westshore Coal Dust Assessment 9.2.6 Existing Conditions Table 9.2-4 Air Quality Criteria for Criteria Air Contaminants Table 9.2-5 Air Quality Criteria for Toxic Organic Contaminants 9.2.7 Air Quality Existing Conditions 9.2.8 Future Conditions with the Project 9.2.9 Future Conditions with the Project and Other Projects and Activities
MFN-1.2	Concerned with potential impacts of air quality on Musqueam crab fisheries in the immediate area, in particular during construction.	19-Nov-2014, Health & Aboriginal Rights Workshop - MFN	**19-Nov-2014, Workshop:** Shared the concern with the health assessment team for consideration.	**Addressed in EIS Appendix 27-A:** Presents a human health risk assessment (HHRA) for air emissions that evaluates the potential for adverse effects on human health as a result of changes in air quality that are attributable to the Project. Specifically, the HHRA considered chronic exposure of these receptors to multiple media following the deposition of benzo[a]pyrene and formaldehyde from predicted emissions. The multi-media assessment followed guidance from the U.S. EPA and Health Canada and considered exposure to chemicals deposited to soil, plants and sediment. The exposure of livestock, wildlife and shellfish to chemicals deposited to	**EIS** 9.0 Physical Setting 9.2.5 Air Quality, Methods Appendix 9.2-A Air Quality Study Main Report Appendix A - Emissions Inventory and

Table 2: Alternative Means of Carrying out the Project

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-2.1	Requested additional information about the process that led to the decision on the proposed design for the Project, in terms of minimizing adverse effects. Requested additional information from the Proponent to allow for: • Careful consideration of all alternatives that could meet the stated purpose for RBT2; • The likelihood of the demand scenario the Project is predicated on actually coming to fruition; and • The rationale for placing this Project in a location of such high risk to our Aboriginal title interests and our present and future priority Aboriginal rights practices.	12-Sep-2016, Issues Workshop - MFN / TFN #2 03-Nov-2016, Letter to Panel (CEAR Document #776)	**12-Sep-2016, Workshop:** Stated that in 2011, there were six versions of the Project footprint under consideration. The location choices included what is proposed in the EIS as well as locations set back 350m and 500m from that. Noted that the other versions situated the footprint at different depths as well as faced it in different directions. When faced the other way, a channel would need to be dredged for ship access and dendritic channels were a major concern. Noted the proposed location is deeper and sub-tidal (meaning the water is at least 2m deep all the time), and locating it further back on the tidal flats creates interactions with things that are exposed at low tide, meaning the potential for dendritic channel formation and scour goes up. The proposed design was the least impactful in terms of physical changes. In the early 2000s the terminal was being contemplated in those shallower locations, but with a better understanding of the stability of the delta under earthquake scenarios, there is confidence that stability can be achieved for a terminal that is located further out on the front of the delta. The alternative locations or orientations were less desirable than what's proposed across a spectrum of different factors.	**Addressed in EIS Section 5.0:** The W1 (0 m) terminal layout is the preferred configuration for a terminal at Roberts Bank due to fewer direct and indirect environmental effects relative to other alternatives considered. In addition to reducing impacts in the intertidal area, the W1 (0 m) alternative was determined to have the least amount of dredging required. Following selection of Option W1 (0 m) as the preferred alternative, further engineering studies were conducted to optimise the preliminary terminal design, which resulted in rounding the northwest corner to further reduce Project-related effects of bed scour post construction. The optimised configuration incorporated into the preliminary Project design is shown on EIS Figure 5-4. The reduction of Project-related effects as a result of this optimisation is discussed in EIS Section 5.4.1.3. The widened causeway without the lagoon was determined to be the preferred option as it will minimise intertidal habitat loss amongst the alternatives considered, and will have the least amount of indirect habitat change from altered coastal geomorphic processes. The widened causeway was further optimised by varying widths to minimise effects to the known biofilm intertidal habitat at the east end of the causeway. The preferred alternative for the intermodal yard is on the marine terminal. The preferred alternative for the rail tie-in is to have one of the two tracks join the main rail network outside the VFPA's jurisdiction to reduce intertidal habitat loss (by approximately 0.32 ha) with a narrower width at the northeast end of the causeway. The tie-in to the existing road corridor at Roberts Bank Way North via a new overpass and access road to the marine terminal was the only technically feasible alternative considered. The preferred option for the location of the tug basin is to expand the existing tug basin with a configuration adjacent to the existing Deltaport Terminal. If the tug basin was placed on the north shore of Roberts Bank Terminal 2 (RBT2), the footprint would affect higher-valued intertidal habitat than at the existing Roberts Bank tug basin location, and the shoreward tug-basin expansion layout at the existing tug basin would result in a higher potential for alterations in tidal flow and the potential for water ponding between the tug basin and Deltaport Terminal. For construction, no alternatives for dredging, temporary sand storage, or construction of supporting land were considered technically or economically feasible. The caisson wharf structure is the preferred alternative to pile and deck wharf due to the reduced noise effects, public opinion, improved seismic performance, and costs. Disposal of sediments at the Project-specific location is the preferred alternative to reduce transportation-related effects and costs. Lastly, as tug wharves constructed using the fill or pile and deck options would result in greater effects to habitat from a larger footprint, the floating pontoons and piles option is preferred. The preferred alternative for each category is described in detail in EIS Section 4.0. The detailed assessment of the preferred alternative (i.e., the Project) is presented in subsequent sections of the EIS. **Addressed in Response to IR1-06:** For each marine terminal alternative location considered in EIS Section 5.3, Table IR1-06-1 in Appendix IR1-06-A summarises the criteria used to assess technical feasibility and provides the conclusion of the feasibility assessment along with supporting rationale. To be considered technically feasible, potential alternatives to the location of the marine terminal within B.C. needed to first meet all technical criteria (as stated in EIS Section 5.2), which included the following:	**EIS** 4.0 Project Description 5.0 Alternative Means of Carrying out the Project Description 5.7 Identification of the Preferred Means Table 5-10 Summary of Preferred Alternative Means **Information Requests** Response to Sufficiency Information Request #6 (IR1-06 of CEAR Document #897)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				• Meeting the long-term container capacity growth by the mid-2020s, through operating efficiencies and a sufficient land base to accommodate growth; • Meeting the requirement for the necessary road and rail connections to efficiently transport containers to and from the market; and • Providing the ability for larger container ships to safely navigate the waterways. Safe navigation includes a minimum berth depth requirement of approximately 18.4 m and the ability to safely turn the vessel around, even in situations of sufficient draught. In addition, consideration was given to terminals with other uses (e.g., serving bulk or break-bulk markets) and if they could retain these capabilities if conversion to container handling was undertaken. The marine terminal location alternatives evaluated (including a combination of these alternatives) were determined not to be technically feasible, and therefore, an evaluation of economic feasibility was not conducted, and an assessment of environmental effects was not required. Based on the analyses of the location alternatives (see Table IR1-06-1), RBT2 was deemed to be the only viable option to meet the anticipated long-term growth and demand of containerised trade on the west coast of Canada, and a full assessment of environmental effects on this preferred alternative was conducted and is described in the EIS. **Additional information provided by the VFPA:** The *2016 Ocean Shipping Consultants forecast* shows continued growth in container trade through the west coast of Canada at a compound annual growth rate of greater than 3% through to 2040, and reinforces the need for planned increases of capacity to ship goods in containers through the existing Deltaport and Centerm terminals in Vancouver and the Fairview Terminal in Prince Rupert. The 2016 Ocean Shipping Consultants forecast also confirms that the proposed Project will be needed by the mid-2020s. The 2016 report is available: http://www.robertsbankterminal2.com/wp-content/uploads/2016-Ocean-Shipping-Consultants-Container-Forecast.pdf.	
MFN-2.2	Stated that the CEA Agency is requested to require VFPA to engage Musqueam in reconsideration, using multiple accounts evaluation tools, of all of the alternative means of carrying out the Project. Stated that VFPA should be required to show how this consultation was considered in its preferred alternatives, and the role ATK and Aboriginal local knowledge played in project planning around alternative means. Stated that the justification of the preferred alternative is part of the consultation required prior to a Crown decision on a Project that will result in adverse impacts and infringement to our title and rights. Thus, in order to inform Crown decisions, analysis of the alternatives should not include merely the financial and engineering feasibility of various	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241) 03-Nov-2016, Letter to Panel (CEAR Document #776)	**15-Oct-2015, Letter from the Canadian Environmental Assessment (CEA) Agency:** "The Agency did not request additional information for this item since there is already some information on alternative means provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review. Additionally, the EIS Guidelines did not require this analysis."	**Addressed in EIS Section 7.2:** Describes the VFPA's approach to engaging and consulting Indigenous groups on RBT2, including its assessment of alternative means of carrying out the project. **Addressed in EIS Section 5.0:** Presents an assessment of alternative means of carrying out the project. The consideration of alternative design configurations and construction approaches resulted in the preferred Project design presented and assessed in the EIS. The Project design minimises potential Project-related effects while enhancing operational efficiencies. As an example, the proposed location of the marine terminal is almost entirely in subtidal waters at Roberts Bank to avoid impacts to sensitive intertidal habitat. This location would also require substantially less dredging and would allow ships to navigate safely without the need of a turning basin. A number of location, orientation, layout and configuration alternatives were considered and assessed for the marine terminal (including berth pocket and marine approach areas), causeway, rail and road corridors, and the tug basin. Alternative construction approaches considered include: dredging alternatives and methods; temporary sand storage locations; construction methods for the supporting land, marine terminal, associated three-berth wharf and widened causeway; disposal of sediments; and expansion of the existing tug basin. The effects of feasible alternatives were considered based on their potential to directly or indirectly affect natural and human environment components. The anticipated effects were considered key factors when comparing and determining preferred means.	**EIS** 5.0 Alternative Means of Carrying Out the Project 7.0 Engagement and Consultation **Information Requests** Response to Sufficiency Information Request #6 (IR1-06 of CEAR Document #897) Response to Sufficiency Information Request #7 (IR1-07 of CEAR Document #897) Response to Sufficiency Information Request #8 (IR1-08 of CEAR Document #897) Response to Sufficiency Information Request #9 (IR1-09 of CEAR Document #897) Response to Sufficiency Information Request #10 (IR1-10 of CEAR Document #897)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	options, but also First Nations' values and impact minimization perspectives. Requested that the Panel require the Proponent to reconsider and provide additional information on the alternatives examined in Section 2 of the EIS, this time with meaningful engagement and dialogue with affected Aboriginal groups, in the same spirit and intent of collaboration supported by the CEA Agency in its August 31, 2016 letter to the Panel chairperson, regarding Requests for Additional Information recommended to the Review Panel.			**Addressed in Responses to IR1-06, -07, -08, -09, -10, -11:** Additional information concerning project alternatives, the alternative means analysis as well as construction alternative means is provided as part of responses to the Review Panel's request for additional information IR1-06, -07, -08, -09, -10, -11.	Response to Sufficiency Information Request #11 (IR1-11 of CEAR Document #897)
MFN-2.3	Stated that in order for the Panel to properly consider these issues, existing information and expertise deficits in the process need to be filled. This should include, but may not be limited to: a. The Panel requiring the Proponent to update its demand estimates given changes in the market; b. The Panel requiring the Proponent to provide information addressing all current West Coast North America container capacity and reasonably foreseeable increases during the time frame to 2030, to support a more detailed examination of the economic competitiveness of all relevant facilities on the west coast of North America; c. The Panel requiring the Proponent to compare likely container handling costs per million TEU per facility and/or capital cost for expansions currently being developed or proposed in west coast North America, as part of an examination of competitiveness of each facility; d. The Panel requiring the Proponent to consider	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Additional information provided by the VFPA:** The VFPA regularly commissions independent market demand estimates. While the EIS discussed the 2014 Ocean Shipping Consultants (OSC) forecast, the VFPA commissioned a comparable report in 2016. The *2016 Ocean Shipping Consultants forecast* shows continued growth in container trade through the west coast of Canada at a compound annual growth rate of greater than 3% through to 2040, and reinforces the need for planned increases of capacity to ship goods in containers through the existing Deltaport and Centerm terminals in Vancouver and the Fairview Terminal in Prince Rupert. The 2016 Ocean Shipping Consultants forecast also confirms that the proposed Project will be needed by the mid-2020s. The 2016 report is available: http://www.robertsbankterminal2.com/wp-content/uploads/2016-Ocean-Shipping-Consultants-Container-Forecast.pdf. As part of its analysis, the 2016 OSC report considers: • North American, Pacific West Coast and Pacific North West container demand as part of its forecasts through to horizon year of 2050; • Container stevedoring charges as part of the competition analysis; and • Effects of the Panama Canal expansion. **Addressed in Response to IR1-03:** Table IR1-03-2 Imports and Exports at the Port of Vancouver present twenty-foot equivalent units (TEU) and % container traffic destined to the U.S. from the Port of Vancouver. Forecast percentages in 2020 and 2030 is 23%. **Addressed in EIS Section 5.0:** Presents an assessment of alternative means of carrying out the project. The consideration of alternative design configurations and construction approaches resulted in the preferred Project design presented and assessed in the EIS. The Project design minimises potential Project-related effects while enhancing operational efficiencies. As an example, the proposed location of the marine terminal is almost entirely in subtidal waters at Roberts Bank to avoid impacts to sensitive intertidal habitat. This location would also require substantially less dredging and would allow ships to navigate safely without the need of a turning basin. A number of location, orientation, layout and configuration alternatives were considered and assessed for the marine terminal (including berth pocket and marine approach areas), causeway, rail and road corridors, and the tug basin.	**EIS** 5.0 Alternative Means of Carrying Out the Project **Information Requests** Response to Sufficiency Information Request #3 (IR1-03 of CEAR Document #897) Response to Sufficiency Information Request #6 (IR1-06 of CEAR Document #897) Response to Sufficiency Information Request #7 (IR1-07 of CEAR Document #897) Response to Sufficiency Information Request #8 (IR1-08 of CEAR Document #897) Response to Sufficiency Information Request #10 (IR1-10 of CEAR Document #897) Response to Sufficiency Information Request #11 (IR1-11 of CEAR Document #897)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	potential changes to container traffic projects that may be affected by expansion of the Panama Canal (e.g., the re-routing of containers projected to travel through Vancouver enroute to south-eastern US destinations via intermodal means); e. The Panel convening pre-hearing conferences to discuss the merits of the Proponent's arguments that the Project represents the only technically and economically feasible alternative that can meet the purpose of the Project, in the VFPA, West Coast BC and west coast North America; f. The Panel requiring the Proponent to identify what proportion of its modelled throughput will be trans-border; and g. The Panel requiring the Proponent to clarify whether the proposed Project is anticipated to meet a demonstrable demand, or rather, is speculative in nature. Requested that the Panel retain third-party expert advice on the accuracy of VFPA's demand estimations, capacity increase limitations in Vancouver, in Prince Rupert, and in other North American west coast markets.			Alternative construction approaches considered include: dredging alternatives and methods; temporary sand storage locations; construction methods for the supporting land, marine terminal, associated three-berth wharf and widened causeway; disposal of sediments; and expansion of the existing tug basin. The effects of feasible alternatives were considered based on their potential to directly or indirectly affect natural and human environment components. The anticipated effects were considered key factors when comparing and determining preferred means.	

Table 3: Archaeological and Heritage Resources – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-3.1	Stated that the Project has the possibility of negatively impacting historical fishing areas; as well as access egress to village sites, significant archaeological sites, and resources nearby. Concerned about the loss of archaeological and heritage sites from the construction and physical occupation of the Project.	15-Oct-2013, Letter to the CEA Agency (CEAR Document #41) 15-Nov-2017, Letter to Panel (CEAR Document #1098)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 28.0:** Presents the results of the assessment of potential effects of the Project on archaeological and heritage resources. The assessment noted the Project may affect archaeological resources, namely fish trap stakes, if present in the Project area. Direct effects could result from Project-related construction activities, and indirect effects could result from changes to sediment deposition or erosion. Following mitigation, residual effects would remain, as there is still the potential for stakes to be exposed or crushed. However, the opportunity for future archaeological study would be protected through mitigation, and the assessment concludes these residual effects are not significant. The Project is not expected to result in significant residual adverse effects to archaeological and heritage resources. The Project is not expected to result in any incremental cumulative effects to archaeological and heritage resources. **Additional information provided by the VFPA:** The Construction Environmental Management Plan will include an Archaeological Monitoring and Management Plan, describing the procedures to be followed by the Infrastructure Developer in the event that an archaeological site is discovered during Project construction (also referred to as a 'chance find'). The plan will also describe the role and responsibilities of a professional archaeologist designated by the Infrastructure Developer to conduct archaeological monitoring, as needed. The Plan will be shared with Indigenous groups for review and comment prior to construction. **Addressed in EIS Section 33.2:** To ensure their alignment with all required Project permits, any conditions of approvals, final designs, finalised construction or operation approaches, and site-specific considerations, the Project's EMPs are necessarily developed and finalised nearer to the start of the construction and operation phases. Feedback on applicable Environmental Management Plan sub-plans will be solicited from Indigenous groups potentially affected by the Project. **Addressed in IR10-24:** VFPA's response to IR10-24, as requested by the Review Panel, discusses the proposed chance find procedure and aspects of the Archaeological Monitoring and Management Plan.	**EIS** 28.0 Archaeological and Heritage Resources 32.2 Current Use of Land and Resources for Traditional Purposes Assessment **Information Requests** Response to Sufficiency Information Request #24 (IR10-24)
MFN-3.2	Concerned with the spatial scope of the archaeological study, and the possibility that archaeological indicators are present in areas that are not being studied.	29-Oct-2014, Preliminary EIS Results Workshop #4	**29-Oct-2014, Workshop:** Stated that the possibility of an archaeological indicator being present in an area that is not being investigated isn't zero, but low. This is as a result of the size of the area and the nature of the sediments that have come in over time. Stated that archaeologists have looked at all the areas where there will be physical effects, and focused on the areas that haven't been disturbed in the past. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in EIS Appendix 7.2-B (#155):** Rationale for the spatial boundaries of the assessment of archaeological and heritage resources is included in EIS Section 28.0 and in the Archaeological Overview Assessment (AOA) that was conducted to support the EIS. The draft AOA was provided to Indigenous groups for review.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 28.0 Archaeological and Heritage Resources 28.4 Information Sources Appendix 28-A Roberts Bank Terminal 2 Technical Report: Archaeological Overview Assessment

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-3.3	Interested in Archaeological monitoring, including: • Requested more detail on the methodology for the monitoring. • Concerned that archaeological fixtures or elements are unlikely to be detected during mitigation test trench. Requested that an archaeologist be on site during construction.	13-Jan-2014, Letter – Comments on draft AOA 29-Oct-2014, Preliminary EIS Results Workshop #4	**13-Jan-2014:** Recorded comment for consideration by the Project team. **29-Oct-2014, Workshop:** An archaeologist will not be present, but staff who are trained to stop and seek advice when something unusual is encountered would be relied upon. **08-May-2014, Letter from the VFPA:** Excavation work is not expected in the vicinity of the causeway crossing the historic slough. A Chance Finds Procedure for the Project construction and operation phases will be outlined in the EIS. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in EIS Appendix 7.2-B (#153):** Mitigation measures, including proposed archaeological monitoring, are described in the EIS. Mitigation for effects on heritage and archaeological resources includes the following measures: • The VFPA will excavate a test trench, or series of trenches, across the eastern end of the causeway expansion area within the area of moderate archaeological potential (historic drainage channel) to enable concurrent inventory (and preservation where possible) of potential fish trap stakes and mitigate future Project-related effects of crushing or degradation of stakes, or reduced access for future study. • The VFPA will ensure annual monitoring, for a period of four years, of predicted erosion of the historic tidal channel (northwest of the terminal, formerly draining Canoe Passage) to mitigate potential exposure of potential fish trap stakes. Any stakes found will be inventoried and preserved where possible. In addition, the Construction Environmental Management Plan will include an Archaeological Monitoring and Management Plan, describing the procedures to be followed by the Infrastructure Developer in the event that an archaeological site is discovered during Project construction (also referred to as a 'chance find'). The plan will also describe the role and responsibilities of a professional archaeologist designated by the Infrastructure Developer to conduct archaeological monitoring, as needed. The Plan will be shared with Indigenous groups for review and comment prior to construction. **Addressed in Response to IR10-24:** The VFPA's response to IR10-24, as requested by the Review Panel, discusses the proposed chance find procedure and aspects of the Archaeological Monitoring and Management Plan.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 28.0 Archaeological and Heritage Resources 28.7.2 Mitigation Measure #2 – Mitigation for Exposure of Potential Fish Trap Stakes 33.0 Environmental Management Program 33.3.4 Archaeological Monitoring and Management Plan **Information Requests** Response to Sufficiency Information Request #24 (IR10-24)
MFN-3.4	Requested an adequate description of Musqueam physical and cultural heritage in the RAA. Requested more detail on how Musqueam was engaged in the identification and investigation of physical and cultural heritage. Stated that the EIS should be culturally rich enough to identify the role this area plays in Musqueam's cultural landscape.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency has requested additional information on cultural heritage in its letter of July 31, 2015 to Port Metro Vancouver [the VFPA] (page 13, #29). However, the EIS guidelines do not require the information to be disaggregated. The Agency did not request additional information regarding physical heritage since there is already some information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."	**Addressed in Response to IR-7.31.15-29:** A noted in IR-7.31.15-29, the EIS, as currently written, contains the requested assessment of the environmental effects of the Project on the cultural heritage of Indigenous peoples. The description of potential Project-related effects on cultural heritage and other cultural considerations, described for each Indigenous group in EIS Section 32.2.4, is contained in EIS Section 32.2.6.4. This section of the document discusses potential changes to sense of place and other changes to Current Use (i.e., risks to safety and security, sensory disturbance from light, noise, and vibration) that could lead to reduced opportunities to practice or transmit cultural values or ways of knowing (i.e., cultural attributes, such as Indigenous traditional knowledge (ITK), including but not limited to language embedded in traditional place names, beliefs relating to transformers) associated with cultural places or landscapes. Further discussion is provided in the IR response. **Addressed in AIMSA – MFN and TWN, Section 7.0:** AIMSA – MFN and TWN Section 7.0 is supplemental to MSA Section 9.5 Current Use of Lands and Resources for Traditional Purposes and Aboriginal and Treaty Rights of the Marine Shipping Addendum (MSA, CEAR Document #316). AIMSA Section 7.0 specifically considers the Current Use by Musqueam First Nation, including intangible heritage considerations, in the marine shipping area. **Addressed in Response to IR10-22:** The VFPA's response to IR10-22, as requested by the Review Panel, further discusses the assessment of cultural heritage, potential disruptions or loss of ceremonial and cultural practices, as well as a potential disruption to sense of belonging, identity and spirituality**.**	**EIS** 32.2.4 Current Use of Land and Resources for Traditional Purposes, Existing Conditions 32.2.6.4 Potential Effect 4: Changes in Quality of Current Use Experience **Additional Information to the Marine Shipping Addendum (AIMSA) – Musqueam First Nation and Tsleil-Waututh Nation** 7.0 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights 7.8 Potential Impacts on Asserted or Established Aboriginal and Treaty Rights **Information Requests** Response to Information Request #29 (IR-7.31.15-29 of CEAR Document #314) Response to Sufficiency Information Request #22 (IR10-22)

Table 4: Coastal Birds – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-4.1	Concerned that Project lighting will attract nearby waterfowl, including those at MFN IR 4, diverting them from their flight pattern and impacting MFN hunting. Concerned about the disruption of waterfowl movement and behaviour from lighting and noise.	16-Jun-2017, Meeting with Administrative Staff 15-Nov-2017, Letter to Panel (CEAR Document #1098)	**16-Jun-2017, Meeting:** Recorded comment for follow consideration by the Project team. Committed to send Musqueam more detailed information on the methodology used for the RBT2 bird studies.	**Addressed in EIS Section 15.7.2.3:** Discusses the Project's potential effects to waterfowl. The section notes no formal above-ground noise disturbance thresholds exist for birds; however, noise levels greater than 85 dBA have been documented to cause coastal waterbirds to flee affected areas (Brown 1990). Noise levels of greater than 85 dBA are anticipated to occur within approximately 60 m to 100 m of the noise source at RBT2. The likelihood of waterfowl encountering impulsive noises greater than 85 dBA is therefore considered infrequent due to the large spatial area and temporal period over which activities will be spread relative to the large size of the local assessment area (LAA). If noise levels are encountered that elicit a response, the resulting effects will likely be negligible due to the large amount of alternate habitat available within the LAA. **Addressed in EIS Appendix 7.2-B (#95):** It is recognised that nocturnal behaviour of birds varies in response to lighting conditions. A review of documented effects of both natural and artificial light on birds is provided in the EIS. The potential effects on coastal birds of changes in artificial light related to the Project are considered in the EIS. A Light Management Plan will be included in the Construction Environment Management Plan and the Operation Environmental Management Plan to reduce artificial light-related effects on coastal birds. **Addressed in Response to IR-7.31.15-25:** The VFPA's response to IR-7.31.15-25, as requested by the CEA Agency, describes the general behaviour of birds to natural and artificial illumination, as documented in existing literature sources. To provide context, it also summarises existing and predicted future illumination levels within the LAA, and provides some common light levels for comparison purposes. For each coastal bird sub-component (including waterfowl), the response provides a characterisation of the way existing artificial light and moon phase affect bird distributions at the Project site and discusses the potential added effects of Project lighting on bird distributions. Based on the review of existing literature and known waterfowl distribution patterns in the LAA and region, anticipated adverse effects to waterfowl from Project-associated lighting are predicted to be minor to negligible. If a species of waterfowl is affected by increased Project-associated illumination, relocation to a less illuminated portion of the LAA would be the most likely effect. Overall, effects to waterfowl productivity are not anticipated. **Addressed in IR9-02:** The VFPA's forthcoming response to IR9-02, as requested by the Review Panel, will further discuss mitigation measures related to artificial light for migratory and non-migratory birds and avian species.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 15.0 Coastal Birds 15.7.2 Future Conditions with the Project, Potential Effect-Changes in Productivity 15.7.2.3 Productivity of Waterfowl 15.8.3 Mitigation #2 – Measures to Address Productivity Loss due to Changes in Habitat Quality 33.0 Environmental Management Program 33.3.5 Construction Environment Management Plan, Light Management Plan 33.4.3 Operation Environment Management Plan, Light Management Plan **Information Requests** Response to Information Request #25 (IR-7.31.15-25 of CEAR Document #314) Response to Information Request #02 (IR9-02)
MFN-4.2	Concerned about the loss of habitat for waterfowl from the construction and physical occupation of the Project.	15-Nov-2017, Letter to Panel (CEAR Document #1098)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 15.7.2.3:** Discusses potential project effects to waterfowl. Changes in the ability of the LAA to support American wigeon, brant, and general waterfowl productive potential are predicted to be minor to negligible. Given the accuracy of the ecosystem model (+/– 5 %), the changes predicted (–8% to +8% changes in biomass) are deemed to be similar to existing conditions. Empirical studies on the percentage of waterfowl foraging habitat directly affected by Project construction support this determination. Additionally, abiotic changes are not anticipated to adversely affect waterfowl, waterfowl productivity, or waterfowl foraging habitat during operation. Due to the importance of eelgrass and marsh habitats to waterfowl and other sub-components, mitigation to offset the direct loss of these habitats and to avoid residual effects is proposed (see EIS Section 11.7 Marine Vegetation, Mitigation Measures). Any decline in waterfowl productive potential will be partially ameliorated since dabbling ducks obtain 50% or more of their overwintering dietary needs from upland habitat near Roberts Bank. Although none of the waterfowl mortalities documented along the causeway have been definitively attributed to vehicle collisions, current indications are that mortality level is low and increases associated with RBT2 operation would have a negligible effect on waterfowl productivity within the LAA. Observations of waterfowl distribution, abundance, and flight patterns at Roberts Bank terminals indicate that waterfowl are likely habituated to existing port activities and associated noise (See EIS Section 15.7.2.1). It is likely that similar habituation to the presence of RBT2 will occur. High levels of anthropogenic activity during construction, both visual and auditory, could disturb waterfowl and exclude them from using suitable habitat within the LAA. Mitigation measures to minimise abrupt noise during construction and other types of disturbance effects are provided in EIS Section 15.8.	**EIS** 11.0 Marine Vegetation 15.7.2.3 Productivity of Waterfowl 15.8 Mitigation Measures

Table 5: Coastal Geomorphology – Intermediate Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-5.1	Concerned about a dead zone with decreased current movement. Stated that DP3 prevents current so back eddy is created so nothing washes out or flows and to build additional structures creates additional dead zones. Stated that the Project area wouldn't allow for continuous water flow and would affect the hydrology, which could potentially create a domino effect for all aquatic resources. Stated that studies were not done on how the additional terminal may impact the shore along the river, as well as the possibility of creating a stagnant area between the terminals and the shore. Stated that this will impact habitat – rearing grounds for all salmon and their feeding area and their migration route; crab and shellfish, migratory and resident bird populations.	16-Jul-2013, Meeting 30-Aug-2013, Meeting 15-Oct-2013, Letter to the CEA Agency (CEAR Document #41)	**16-Jul-2013, Meeting:** Stated that the VFPA's coastal geomorphology group is looking at this. Committed to provide MFN with results pertaining to coastal geomorphology when available. **30-Aug-2013, Meeting:** Committed to providing Musqueam with the studies completed on the Deltaport Third Berth Project (DP3) regarding water flow. **10-Sep-2013, Phone call:** Stated that reports regarding DP3 are available on the B.C.'s Environmental Assessment Office's website. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in EIS Appendix 7.2-B (#50):** Changes in hydrology are predicted to affect salinity and turbidity levels, and increase sediment deposition as a result of the Project, but these changes are anticipated to be minimal relative to existing natural variability. These localised indirect effects of changes in hydrology on habitat are evaluated in the marine biophysical component effects assessments, including marine vegetation, marine invertebrates, marine fish, and coastal birds. **Addressed in EIS Appendix 7.2-B (#49):** Field studies, air photo review, and modelling of sediment deposition at Roberts Bank (including Canoe Passage) were undertaken during the Project assessment, as described in the EIS. A Canoe Passage discharge channel location and sediment distribution (e.g., bar formation or buildup of sand) were modelled to assess variation pre- and post-terminal construction. Potential changes associated with the configuration of RBT2 were assessed in relation to Roberts Bank, including the Canoe Passage discharge channel. Project-related changes to coastal geomorphological processes on Roberts Bank are predicted to be associated with the terminal footprint. However, the Project is not anticipated to alter sediment dynamics or water movement in and around the mouth of the Fraser River. Changes are anticipated around the terminal and within the intertidal zone shoreward of the terminal. The effects of these changes on valued components (VC) are considered in the EIS. **Addressed in EIS Appendix 7.2-B (#185):** The Project is not located on the Fraser River and no Project-related effects are predicted on the Fraser River.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-5.2	Asked for clarification on findings for tidal flows in the Canoe Passage area. Asked if the BC Ferries and Roberts Bank causeways are responsible for observed change in the Canoe Passage outlet between 1949 and 1971 (as opposed to a storm event, as suggested by VFPA). Concerned that the Project will result in geomorphological changes that will adversely affect navigability in the vicinity of Canoe Passage. Concerned with impacts to eulachon if the mouth/outlet of Canoe Passage were to move.	08-Oct-2014, Preliminary EIS Results Workshop #2 19-Jul-2016, Issues Workshop - MFN / TFN #1 12-Sep-2016, Issues Workshop - MFN / TFN #2	**08-Oct-2014, Workshop:** This is an existing tidal channel. It's a spot where Canoe Passage used to be. In the last seven decades Canoe Passage has moved back and forth. The tidal flows go back and forth in that zone. We don't think the channel will become unstable and start migrating around, but the sediment will just go back and forth. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. **19-Jul-2016, Workshop:** The EIS documented areas of depressed wave activity behind the terminal, allowing fine sediments to deposit. Those are the main geomorphic changes. No changes to mouth of River were identified or predicted. Stated that the EIS did consider effects to access, and it did look at results to see where there might be an interaction between changes in geomorphology and navigation and access. However, the VFPA commits to follow up with additional information. **12-Sep-2016, Workshop:** When hydrodynamic modelling is done and the flow on and off is calculated, the effect of the causeway doesn't extend into the Canoe Passage region. It doesn't affect the flow field. It is noted that in the photo the Project and Canoe Passage look close in proximity, but in terms of the hydrodynamics of flow, the Project won't result in changes to Canoe Passage. **12-Sep-2016, Workshop:** The VFPA held a subsequent issues workshop, which included a presentation on coastal geomorphology to specifically address this concern.	**Addressed in EIS Appendix 7.2-B (#49):** Field studies, air photo review, and modelling of sediment deposition at Roberts Bank (including Canoe Passage) were undertaken during the Project assessment, as described in the EIS. A Canoe Passage discharge channel location and sediment distribution (e.g., bar formation or buildup of sand) were modelled to assess variation pre- and post-terminal construction. Potential changes associated with the configuration of RBT2 were assessed in relation to Roberts Bank, including the Canoe Passage discharge channel. Project-related changes to coastal geomorphological processes on Roberts Bank are predicted to be associated with the terminal footprint. However, the Project is not anticipated to alter sediment dynamics or water movement in and around the mouth of the Fraser River. Changes are anticipated around the terminal and within the intertidal zone shoreward of the terminal. The effects of these changes on VCs are considered in the EIS.	**EIS** 9.5 Coastal Geomorphology Assessment Appendix 9.5-A Roberts Bank Terminal 2 Technical Report, Coastal Geomorphology Study 9.5.6 Existing Conditions 9.5.8 Future Conditions with the Project Table 9.5-6 Predicted Morphological Changes from the Project Footprint Figure 9.5-35 Approximate Spatial Extent of Potential Changes Associated with the Project Footprint
MFN-5.3	Asked how changes are mitigated if the predictions don't come to pass with respect to predictive effects of coastal geomorphology.	12-Sep-2016, Issues Workshop - MFN / TFN #2	**12-Sep-2016, Workshop:** Responded that no model is 100% reliable, but that the VFPA is confident in the process that went into the design of the study. The VFPA used the best tools, and the results were properly understood. **17-Jul-2017, Meeting:** The VFPA met with Musqueam First Nation to discuss the Follow-up Program. The Program includes an Adaptive Management Strategy, which includes a plan for coastal geomorphology. The VFPA is seeking input from Musqueam First Nation on the Program.	**Addressed in EIS Section 33.5:** Similar to the Adaptive Management Strategy for DP3, as described in EIS Section 33.5, the VFPA is committed to developing and implementing a Follow-up Program for the Project. The purpose of the Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project. To ensure the Program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the EIS. The Follow-Up Program will include: • An evaluation of the adequacy of existing data to provide a benchmark against which to test Project-related effects; • A monitoring design drawing on the measurable parameters identified to be field-tested; • A methodological approach for using field-collected data to measure and verify the accuracy of the effects predicted in the EIS;	**EIS** 33.5 Follow-up Program

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				• A reporting framework that defines frequency of reporting, distribution and feedback mechanisms; and • Details of the VFPA's approach to adaptive management for the Project through construction and operation. The Follow-Up Program will be developed in consultation with federal agencies, including the CEA Agency, Fisheries and Oceans Canada (DFO), and Environment Canada. Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on the program and approving agencies have an opportunity to evaluate and approve the Program. Feedback from Indigenous groups regarding the draft Program will be sought through the VFPA's ongoing engagement initiatives.	
MFN-5.4	Noted the need for more information on the breaching of the causeway, and potential impacts to hydrology, flows and habitat. Recalled and requested a study undertaken for DP3 that considered putting a culvert through the causeway.	30-Aug-2012, Meeting 30-Sep-2013, Meeting with Administrative Staff 18-Oct-2013, Meeting 21-Nov-2016, Community Meeting	**30-Aug-2012, Meeting:** Recorded comment for consideration by the Project team. **30-Sep-2013, Meeting:** Recorded comment for consideration by the Project team. **18-Oct-2013, Meeting:** Stated that the VFPA is trying to locate the DP3 Report on the culvert that was previously requested by Musqueam. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. **29-Nov-2016, Email from the VFPA:** Provided the memo on the potential effects of opening the causeway (2004 NHC Memo): http://www.robertsbankterminal2.com/wp-content/uploads/RBT2-Potential-Effects-of-Opening-the-Causeway-June-2005-NHC-Memo-January-2014.pdf.	**Addressed in EIS Appendix 7.2-B (#3):** The extent of widening along the causeway is determined by road and rail infrastructure requirements for the Project. To minimise the marine footprint, widening will vary from 0m to approximately 140m. Past experience at Roberts Bank has indicated that the tidal flats are sensitive to disturbance. In particular, past development has resulted in localised development and expansion of tidal channels and associated changes in the degree of influence of the Fraser River outflow plume on the inter-causeway area. An independent technical study, "Potential Effects of Opening the Causeway," was undertaken for the Vancouver Port Authority in 2005 to clarify issues related to physical processes and hydraulic behaviour in the causeway area of Roberts Bank. This report determined that there is a substantial risk that a new opening in the causeway could initiate a new sequence of morphological changes on the tidal flats, which could adversely affect the existing habitat conditions. The report is available on the Project website: http://www.robertsbankterminal2.com/wp-content/uploads/RBT2-Potential-Effects-of-Opening-the-Causeway-June-2005-NHC-Memo-January-2014.pdf. Based on the findings of this report, and the evaluation of adding a flow passage channel, the VFPA does not propose to open the Roberts Bank causeway.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table **Project Website** http://www.robertsbankterminal2.com/wp-content/uploads/RBT2-Potential-Effects-of-Opening-the-Causeway-June-2005-NHC-Memo-January-2014.pdf
MFN-5.5	Interested in the processes that cause the formation of dendritic channels.	12-Sep-2016, Issues Workshop - MFN / TFN #2	**12-Sep-2016, Workshop:** The existing dendritic channels formed in the inter-causeway area (between the Roberts Bank causeway and the BC Ferries Causeway) as a result of dredging activities that extended up on to the tidal flats in the 1980s. There is a sharp (as opposed to gradual) drop to deeper water; the tidal flow erodes the sediment away when it reaches the deeper area. Dendritic channel formation was a major topic as part of the DP3 Project Coastal Geomorphology investigations and a very good understanding was developed of what can cause them to form and a lot of time was spent thinking about whether the activities related to RBT2 could trigger a new channel or cause the existing one to be active. It is not expected that the channel northwest of RBT2 will behave similarly. The only dredging proposed for RBT2 would be out in deep water along the berth face.	**Addressed in EIS Section 9.5:** Presents the results of the coastal geomorphology assessment, which provides further information concerning processes that cause the formation of dendritic channels. Dendritic channels are a type of branching tidal channel produced when a stream receives several tributaries which in turn are fed by smaller tributaries. Branching occurs randomly in all directions and at almost any angle, resembling in plan the branching habit of certain trees. EIS Section 9.5.6.3 discusses tidal channel features and their historical formation in the inter-causeway and north of the Roberts Bank causeway.	**EIS** 9.5 Coastal Geomorphology 9.5.6.3 Morphology of Roberts Bank
MFN-5.6	Interested in additional information and	19-Jul-2016, Issues	**19-Jul-2016, Workshop:**	**Addressed in Response to IR2-08:** As outlined in the response to IR2-08, ongoing geomorphic processes have resulted in changes to the Fraser River delta foreslope (located in deeper water	**Information Requests**

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	explanation regarding the coastal geomorphology assessment. Asked about the geomorphological effects of the Project. Concerned about sediment change on the shoreline, effects from scouring, and hydrology effects from moving dredge material.	Workshop - MFN / TFN #1 12-Sep-2016, Issues Workshop - MFN / TFN #2 12-Jun-2017, Roberts Bank Boat Tour #1 16-Jun-2017, Meeting with Administrative Staff 10-Jul-2017, Roberts Bank Boat Tour #2	Undertook to schedule a subsequent workshop with coastal geomorphologist to respond to topic-related questions and concerns. **12-Sep-2016, Workshop:** At a subsequent workshop coastal geomorphology was discussed to address concerns raised. **12-Jun-2017, Boat Tour:** Responded that the effects of the Project on coastal geomorphology are relatively localised to the terminal footprint. The north-eastern tip of the terminal footprint was modified (i.e., rounded) to reduce scour. No changes in geomorphology are anticipated close to the shoreline. **16-Jun-2017, Meeting:** Responded there have since been IR responses written on the topic of coastal geomorphology which can be shared. Suggested holding a follow-up meeting on the topic of coastal geomorphology. **10-Jul-2017, Boat Tour:** Referenced previous meeting and having discussed possibility of holding a workshop on this topic, with the coastal geomorphologist in attendance. Musqueam committed to advise the VFPA of any workshops or focused meetings of interest.	at the outer edge of the tidal flats) in the vicinity of the proposed terminal. Construction of the RBT2 terminal will result in armouring of a 1,700 m long section of the foreslope down to -30 m CD, and will effectively halt any erosion of the foreslope in that area that may be occurring at present. **Addressed in Responses to IR2-07 and IR2-09:** As outlined in the responses to IR2-07 and IR2-09, topographic changes on the tidal flats have been evaluated, including changes to existing tidal channels. These changes are related to ongoing geomorphic processes as well as changes related to previous construction of the causeway and existing terminals. Widening of the causeway and development of the RBT2 terminal is not predicted to change drainage patterns or the morphology of the tidal flats in this area north of the causeway in the future with the Project. **Addressed in Response to IR2-16:** Clarification concerning the assessment of changes to Coastal Geomorphology that may occur in relation to the construction and operation of the proposed Project is provided in the response to IR2-16. The response confirmed that all Project components have been assessed in accordance with the requirements of the *Updated EIS Guidelines* for the local study area, which extends from the BC Ferries Terminal to Canoe Passage. **Addressed in Response to IR2-17:** The response to IR2-17 includes additional clarification concerning the expected extents of changes to Coastal Geomorphology related to the proposed Project. Changes to coastal geomorphology and hydrodynamic conditions in areas on the south side of the existing Roberts Bank causeway, including the inter-causeway area and areas south of the BC Ferries Terminal, that are related to the Project components on the north side of the causeway are not anticipated because areas on the south side are hydrodynamically isolated from the north side of the Roberts Bank causeway by deep water and the presence of the existing causeways. The only Project component expected to influence coastal geomorphology or hydrodynamics in the inter-causeway area is the expanded tug basin, which is expected to result in localised changes to the existing coastal landforms in that area.	Response to Sufficiency Information Request #7 (IR2-07 of CEAR Document #961) Response to Sufficiency Information Request #8 (IR2-08 of CEAR Document #961) Response to Sufficiency Information Request #9 (IR2-09 of CEAR Document #961) Response to Sufficiency Information Request #16 (IR2-16 of CEAR Document #961) Response to Sufficiency Information Request #17 (IR2-17 of CEAR Document #961)
MFN-5.7	Requested a commitment from VFPA that there wouldn't be increased dredging activities in the Fraser River to provide materials for RBT2.	16-Jun-2017, Meeting with Administrative Staff	**16-Jun-2017, Meeting:** Responded there would not be increased dredging as a result of the Project; the proposed plan is to use material from annual maintenance dredging.	**Addressed in EIS Section 4.0:** As described in EIS Section 4.0, the development of land for the marine terminal would use material from Project construction dredging, existing quarries and sand from the annual Fraser River Maintenance Dredging Program. As this is an existing non-Project-related program carried out to maintain the shape and safe depths of Fraser River shipping channels, the annual volume of materials dredged from the Fraser River are unrelated to the RBT2. **Addressed in PCU:** As requested by the Review Panel, the VFPA submitted the PCU on June 12, 2018, providing: • Detailed revised Project description, including a revised construction schedule; • Revised Project interaction matrix; • Preliminary details pertaining to the management and timing of dredging activities and the discharge of sediment-laden water; and • Revised assessment of environmental effects as required by the Project modifications. PCU Sections 1.0 and 2.0 describe the changes to the EIS, including updates to specific construction activities, the construction schedule, and relevant Project	**EIS** 4.0 Project Description **PCU (CEAR Document #1210)**

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				Description figures and appendices. In PCU Section 3.0, changes or effects resulting from the construction updates on ICs and VCs are described. Overall, these changes to the EA resulting from construction updates can generally be summarised as follows: • Reductions in potential adverse changes or effects on ICs, biophysical VCs, social VCs, and Current Use; and • Increases in positive interactions with socio-economic VCs. These beneficial changes to ICs and VCs occur at the level of interactions or potential effects, and in most cases are slight changes, and thus do not affect the overall conclusions made in the EIS, including proposed mitigation, residual effect characterisations, significance determinations or cumulative effects, as applicable, with one exception. The only component predicted to have a change to residual effects is land and water use, with a reduction of a residual effect on access to Tsawwassen First Nation community lease lands from a measurable non-significant residual effect to a negligible residual effect, due to elimination of the ITP and associated activities.	

Table 6: Effects Assessment Methods (including Cumulative Effects)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-6.1	Criticised the methodology employed for the cumulative effects assessment in the EIS: "there has been no cumulative effects assessment". Requested consideration of cumulative effects on Current Use for Lands and Resources for Traditional Purposes. Stated that the fact that there was no cumulative effects assessment for either Section 32 of the EIS, or for Section 9.5 of the MSA creates a critical gap in the Marine Shipping Addendum that must be addressed before this assessment can be considered in compliance with the EIS Guidelines and section 19 (1) of CEAA 2012. Stated that Section 32 of EIS omits any assessment of cumulative effects, as required under the *Canadian Environmental Assessment Act, 2012* (CEAA 2012) for assessing 5(1)(c) effects. It also fails to provide any "contextual" analysis related to the seriousness of adverse effects on Aboriginal rights or incorporate the Aboriginal perspective, as required under common law. Stated that Musqueam strongly disagrees with characterisation of yet-to-be-defined mitigation as highly effective for addressing stated effects. Stated that the AIMSA lack of a cumulative effects assessment on Musqueam Current Use to be a serious deficiency and inconsistent with required methodology for the assessment of effects on VCs.	22-Jan-2016, Meeting 23-May-2016, Letter & Musqueam Marine Shipping Effects Assessment 15-Sep-2016, Email 03-Nov-2016, Letter to Panel (CEAR Document #776) 10-Nov-2017, Letter to the CEA Agency	**22-Jan-2016, Meeting:** Responded that the VFPA is responding to additional information requests from the CEA Agency, which includes additional cumulative effects assessment information. The VFPA undertook a full Cumulative Effects Assessment in accordance with the Agency's current guidelines. The VFPA is committed to coming back with the appropriate experts to speak to these matters further. **07-Jul-2016, Letter from the VFPA:** With respect to Musqueam's request for a cumulative effects assessment of CULRTP, the VFPA has determined that assessment of cumulative effects associated with past developments (that may interact with the residual effects of the Project) has been completed and can be found in the EIS. Supplemental information can be found in the VFPA's response to IR-7.31.15-13 and AIR-12.04.15-13 from the Agency. The cumulative effects assessment takes into consideration the potential residual effects of the Project in combination with the effects of other projects and activities that have been or will be carried out, including effects on local and Indigenous communities, The methods used to assess the potential effects of the Project, including both residual effects of the Project and cumulative effects, are described in EIS Section 8.0, and these methods are consistent with existing federal guidance. We would be happy to review this with you. **30-Sep-2016, Letter from the VFPA:** Responded that comments have been included and incorporated in the AIMSA, and will also be submitted directly to the Review Panel and posted on the public registry. Enclosed an excerpt from AIMSA Appendix 2-B showing your September 15, 2016 comments on the final draft AIMSA and the VFPA's response to those comments. "Consistent with the methods applied in the assessments of potential effects on VCs, the Current Use assessment did not undertake a cumulative effects assessment because the Current Use assessment predicts that there will be no measurable residual effects on Current Use as a result of marine shipping	**Addressed in EIS Appendix 7.2-B (#34):** The methods used to assess the potential effects of the Project, including both residual effects of the Project and cumulative effects, are described in EIS Section 8.0. The environmental assessment (EA) for the Project was developed to meet the requirements specified in the *EIS Guidelines* and consistent with existing guidance documents, including the Operational Policy Statement Assessing Cumulative Environmental Effects Under the *Canadian Environmental Assessment Act, 2012*, Determining Whether a Project is Likely to Cause Significant Adverse Environmental Effects, the Cumulative Effects Assessment Practitioners' Guide, and the *Guideline for the Selection of Valued Components and Assessment of Potential Effects*, among others. Where measurable residual effects to a VC have been predicted to result from the Project, a cumulative effects assessment was conducted to determine whether Project-related residual effects are likely to interact cumulatively with the effects of other projects and activities. Similarly, where Project-induced changes to an intermediate component (IC) were expected, the potential for those changes to combine cumulatively with changes caused by other projects and activities was assessed. **Additional information provided by the VFPA:** As described in the EIS, a cumulative effects assessment was conducted for the following socio-economic VCs: Marine Commercial Use, Visual Resources, Land and Water Use, Human Health, and Archaeological and Heritage Resources. A cumulative effects assessment was not conducted on Labour Market, Economic Development, Local Government Finances, Services and Infrastructure, Outdoor Recreation as no measurable adverse residual effects were predicted on these VCs. This was also the case for Current Use Section 32.2.9); however, Indigenous perspectives on cumulative effects to date are summarised for each Indigenous group in Section 32.2.4. **Addressed in Response to AIR-12.04.15-13:** In the EIS, the existing conditions (baseline) reflect the conditions of the environment as modified by past development. Further discussion of how the VFPA considered the effects of past, present and future projects is provided in AIR-12.04.15-13. Specifically, Schedule 13-3 describes effects of past projects and activities on fish and fish habitat. For a broader perspective, the coastal marine environment (i.e., coastal geomorphology, marine sediment, marine water quality, tidal flat morphology, biosedimentological zones) is discussed in Appendix AIR13-A.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 8.0 Effects Assessment Methods 8.1.9 Cumulative Effects Assessment 21.11 Cumulative Effects Assessment 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2.9 Cumulative Effects Assessment **AIMSA – MFN and TWN** Appendix 2-B Aboriginal Issues and Interests 7.0 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights 7.4 Suggested Mitigation Measures 7.6 Cumulative Effects Assessment **Information Requests** Response to Additional Information Request #13 (AIR-12.04.15-13 of CEAR Document #388)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			associated with the Project after the implementation of suggested mitigation measures. The VFPA is confident in the effectiveness of the suggested mitigation measures described in the AIMSA, but has noted Musqueam's views on these suggested measures in Section 7.4. These measures are the same as those described in the MSA. By way of this comment, the VFPA notifies the CEA Agency and the Review Panel of Musqueam First Nation's views on the suggested mitigation measures and the concern raised regarding the lack of a cumulative effects assessment on Musqueam Current Use."		
MFN-6.2	Requested that the EIS be amended to identify whether and how ATK and inputs from affected First Nations was considered by the Proponent in developing these conceptual level plans, and describe the Proponent's commitments to engage affected First Nations in further plan development.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency has requested additional information regarding Aboriginal Traditional Knowledge in its letter of July 31, 2015 to Port Metro Vancouver [the VFPA] (page 3, #8). The Panel will determine whether it requires additional information or clarification with respect to the consideration of ATK to inform its sufficiency review."	**Addressed in Response to IR-7.31.15-08:** Response to IR-7.31.15-08, provides a description of where and how ITK has been used to support the selection of VCs, baseline descriptions, the assessment of effects including the identification of mitigation measures, and in the determination of significance of adverse environmental effects. Response to MSA IR-02.24.16-4 discusses the application of ITK in the MSA. **Addressed in Response to IR10-02:** The VFPA's response to IR10-02, as requested by the Review Panel, provides further information concerning how available Indigenous knowledge was incorporated into the EIS and MSA. **Addressed in Response to IR10-11:** The VFPA's response to IR10-11 describes how Indigenous groups will be involved in the development, implementation, and management of the RBT2 Follow-up Program. Such involvement is intended to ensure the provision and use of traditional knowledge in the ongoing RBT2 Follow-up Program.	**Information Requests** Response to Information Request #8 (IR-7.31.15-08 of CEAR Document #314) Response to Additional Information Request #4 (MSA IR-02.24.16-4 of CEAR Document #386) Response to Sufficiency Information Request #2 (IR10-02) Response to Sufficiency Information Request #11 (IR10-11)
MFN-6.3	Requested consideration of project-specific and cumulative effects on VC subcomponent species requested by Musqueam.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency did not request additional information for this item since Port Metro Vancouver [the VFPA] provided a rationale for its selection of VCs in the EIS. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."	**Addressed in Response to IR5-15:** In its response to IR5-15, issued by the Review Panel on June 6, 2017 (CEAR Document #975), the VFPA specifically discusses existing conditions related to: • Fraser River Eulachon, both larvae and adults; • White Sturgeon (Lower Fraser Population); • Green Sturgeon; • Cultus Lake Sockeye; • Interior Fraser Coho Salmon; and • Steelhead Trout. The response information on the biology, migration behaviour, habitat utilisation in the LAA and regional assessment area (RAA), a biological effects assessment of the proposed Project, as well as management practices, and ongoing recovery activities of the above species. As noted in that IR response, assessment conclusions and mitigation measures for representative species also apply to eulachon remain unchanged.	**Information Requests** Response to Sufficiency Information Request #15 (IR5-15 of CEAR Document #1078)
MFN-6.4	Asked whether cumulative effects assessment includes marine shipping and impacts to Aboriginal fisheries.	07-Oct-2014, Preliminary	**07-Oct-2014, Workshop:**	**Addressed in EIS Appendix 7.2-B (#35):** Reasonably foreseeable projects and activities related to marine shipping, including incremental marine vessel traffic associated with RBT2, is	**EIS**

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
		EIS Results Workshop #1	Responded that yes, the VFPA undertook a cumulative effects assessment for marine shipping and fish. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. **30-Sep-2016, Letter from the VFPA:** Responded that comments have been included and incorporated in the AIMSA, and will also be submitted directly to the Review Panel and posted on the public registry. Provided a copy of the AIMSA, which includes Section 7.3.5 on potential effects on current use.	considered in the cumulative effects assessment. The potential cumulative effects of the Project in combination with other projects and activities that have been and will be carried out, including existing and future shipping, on Indigenous fisheries are discussed in the EIS Sections 16.0, 21.0, and 32.2. **Addressed in AIMSA – MFN and TWN Section 7.3.5:** The potential effects of marine shipping associated with the Project within the marine shipping area on the Current Use, including intangible cultural heritage, of Musqueam First Nation and Tsleil-Waututh Nation may be summarised as follows: Negligible with respect to: • Change in access to preferred Current Use locations as a result of Project-associated ship wake; • Change in availability of preferred Current Use resources; • Change in quality of preferred Current Use resources; and • Change in quality of Current Use experience (except as specified below); and Minor with respect to: • Change in access to preferred Current Use locations as a result of Project-associated increases in ship pass-bys; and • Change in quality of Current Use experience associated with the Project-associated increases in ship pass-bys. Two suggested measures are identified in MSA Section 9.5.6 for consideration by appropriate regulatory authorities (i.e., those with jurisdiction over marine shipping outside of the VFPA's boundaries) to mitigate the potentially minor incremental effect on Current Use access and associated quality of Current Use experience that may result from potential increases in overlap between Current Use activities and Project-associated ship pass-bys in the marine shipping area. These suggested measures are both consultative in nature: • Consultation on the development of a potential marine shipping activities communication plan that would provide affected Indigenous groups with real-time information regarding the movement of Project-associated shipping traffic through the marine shipping area; and • Consultation with the affected Indigenous groups to identify measures that would reduce the impact of the international shipping lanes to fishing by Indigenous groups. As the implementation of mitigation measures referred to above are expected to effectively address potential incremental effects to Current Use by Musqueam First Nation and Tsleil-Waututh Nation as a result of Project-associated vessel transit activities within the marine shipping area, residual effects from those activities on Current Use are expected to be negligible for both groups.	Appendix 7.2-B Aboriginal Groups Interests and Issues Table 8.0 Effects Assessment Methods Table 8-8 Project and Activity Inclusion List 8.1.9 Effects Assessment Methods, Environmental Assessment Methods, Cumulative Effects Assessment 16.0 Ongoing Productivity of Commercial, Recreational, and Aboriginal Fisheries 21.0 Marine Commercial Use 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes **AIMSA – MFN and TWN** 7.0 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights 7.2.1 Musqueam First Nation, Existing Conditions 7.3.5 Summary of Potential Effects on Current Use
MFN-6.5	Requested Cumulative Effects – The Consideration of Past and Existing Projects: The Proponent must provide a clear understanding of not only how a VC is affected by future projects, but also by past and existing projects and activities.	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 8.1.9:** EIS Section 8.1.9 provides a detailed explanation of the cumulative effects assessment methodology. **Addressed in Response to AIR-12.04.15-13:** In the EIS, the existing conditions (baseline) reflect the conditions of the environment as modified by past development. Further discussion of how the VFPA considered the effects of past, present and future projects is	**EIS** 8.1.9 Cumulative Effects Assessment **Information Requests** Response to Information Request #13 (IR-7.31.15-13 of CEAR Document #314)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Requested that the Panel require the Proponent to follow the recommendation of the Canadian Environmental Assessment Agency's ("CEAA") July 31, 2015, Additional Information Requirement #13, in which it was stated that "Consideration of past effects could be done by describing qualitatively known trends in the condition of the valued component using available Indigenous traditional knowledge, historic data or any other sources and describing how past activities have affected the conditions of the valued component."			provided in AIR-12.04.15-13, including in that response's Schedules focused on applicable VCs. Taken together, these schedules build on the information provided in the EIS and provide new, more explicit and clear descriptions of how the residual effects of the Project will combine cumulatively with the effects of past and current projects and activities, and with the effects of certain and reasonably foreseeable future projects.	Response to Additional Information Request #13 (AIR-12.04.15-13 of CEAR Document #388)
MFN-6.6	Concerned with cumulative effects from the major industrial projects planned in Musqueam territory, including but not limited to the • George Massey Tunnel replacement project; • WesPac Marine Jetty project; • Kinder Morgan Trans-mountain Pipeline Expansion project; and • the VFPA Vancouver Airport Fuel Delivery project. Requested that effects be understood in the context of adverse effects from other sources (past, present, and likely future). Requested a deeper consideration of cumulative alienation from traditional harvesting grounds due to avoidance related to perceived risk related to marine shipping, currently associated with BC Ferries and Delta Port terminals, as well as the proposed RBT2 Project. Requested Cumulative Effects – Missing Foreseeable Future Projects: In order to address cumulative effects, the Proponent should be asked to provide a supplementary submission on reasonably foreseeable (if not certain) projects that are currently undergoing provincial environmental assessments, but not considered in the EIS: • George Massey Tunnel Replacement Project, • WesPac Tilbury Marine Jetty Project, and	24-May-2016, Musqueam First Nation Marine Shipping Effects Assessment 15-Sep-2016, Email 03-Nov-2016, Letter to Panel (CEAR Document #776)	**30-Sep-2016, Letter from the VFPA:** Responded that comments have been included and incorporated in the AIMSA, and will also be submitted directly to the Review Panel and posted on the public registry. Enclosed an excerpt from AIMSA Appendix 2-B showing your September 15, 2016 comments on the final draft AIMSA and the VFPA's response to those comments. "The [Musqueam Marine Shipping Effects Assessment] MMSEA provided to the VFPA was thoroughly reviewed, and Musqueam views regarding existing impacts were included throughout Section 7.2.1 in relation to existing conditions within and outside the Marine Shipping Area, and summarised in Section 7.3.1 through Section 7.3.4 in relation to potential incremental effects of marine shipping associated with the Project in the Marine Shipping Area (i.e., the scope of the assessment for the AIMSA). The VFPA notes that this concern is specific to marine shipping at Roberts Bank, which was assessed as part of the EIS. The AIMSA considers effects from marine shipping occurring in a separate area, the marine shipping area as defined in Figure 1-1 of the MSA."	**Addressed in AIMSA – MFN and TWN Appendix 2-B (#6):** The assessment of potential effects of marine shipping associated with the Project incorporates the existing vessel traffic within the marine shipping area (defined in MSA Section 4.0), including vessel traffic from projects in Musqueam territory. The list of certain and reasonably foreseeable projects and activities considered in the cumulative effects assessment for the MSA is included in MSA Appendix 6-A. [The list includes the Kinder Morgan Pipeline Expansion Project as well as the Vancouver Airport Fuel Delivery Project.] **Addressed in Response to IR4-09:** In responding to IR4-09, updated project status and vessel movement information is provided as available for the projects listed in the EIS and MSA (north of Segment B), plus other new projects considered to be certain or reasonably foreseeable (as of July 1, 2017). As part of this update, Wespac Tilbury Marine Jetty Project vessel projections are updated. **Addressed in EIS Table 8-8:** As noted in EIS Table 8-8 Project and Activity Inclusion List, the George Massey Tunnel Replacement Project and Pattullo Bridge Replacement Project are considered in the EIS' cumulative effects assessments.	**MSA** 2.0 Geographic Setting 4.0 Activity Description 4.1.1.1 Existing Marine Traffic Activity, Table 4-2 6.0 Effects Assessment Approach Appendix 6-A Certain and Reasonably Foreseeable Projects and Associated Activities Considered in the Marine Shipping Cumulative Effects Assessments 32.2 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes **AIMSA – MFN and TWN** Appendix 2-B Aboriginal Issues and Interests 7.0 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights 7.2.1 Musqueam First Nation, Existing Conditions 7.3.1 Access to Preferred Current Use Locations 7.3.4 Quality of Current Use Experience **Information Requests** Response to Sufficiency Information Request #9 (IR4-09 of CEAR Document #1051)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	• Pattullo Bridge Replacement Project.				
MFN-6.7	Stated that the current use assessment neglects to consider how port development has already taken away Musqueam's ability to exercise rights in the area, due to construction of the existing causeway as well as industrial and environmental contamination. Asked how the assessment considered past and current projects in the cumulative effects assessment. Concerned that there are no cumulative effects predicted on Musqueam's current use of lands and resources for traditional purposes, and with how cumulative effects were done in general. Expressed the need to account for the potential effects of the Project in the context of, in interaction with, and in addition to past, present, and likely future projects.	03-Jul-2014, VCs Workshop #2 18-Jun-2014, Meeting 07-Oct-2014, Preliminary EIS Results Workshop #1 12-Sep-2016, Issues Workshop - MFN / TFN #2 15-Nov-2017, Letter to Panel (CEAR Document #1098)	**03-Jul-2014, Workshop:** Responded that while the EIS will contains some information on historical use and changes that have occurred, the focus of the assessment is impacts on current use. Stated that the EIS does consider Indigenous marine use in a broader context, which includes an historical piece. The commercial fisheries assessment is using historical data to the extent possible. The assessment also looks at potential changes to fish, crab, and other marine resources. **18-Jun-2014, Meeting:** Noted that the VFPA is looking to gather further information on current use ahead of receiving Musqueam's traditional use study. Reviewed current sources of ITK related to Musqueam for use in the EIS. **07-Oct-2014, Workshop:** Stated that when we look at the existing conditions, which is part of our assessment, we are taking into account the effects of projects that have happened previously. Noted that it's not the intent of a specific project like RBT2 to mitigate for all past effects and developments. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. **12-Sep-2016, Workshop:** Responded that the methodology for cumulative effects includes existing conditions which reflect past and current projects. The cumulative effects assessment is written in two sections of the EIS. Stated that AIR #13 provided an overarching summary of the cumulative effects methodology for the Project. As part of that methodology, if there's a residual effect, then that is assessed in combination with other reasonable foreseeable projects. Secondly, there's a schedule and appendices for each VC with a residual effect, which shows past, present and future effects in one place.	**Addressed in EIS Appendix 7.2-B (#36):** The description of existing conditions for each VC considers the conditions of the VC as they have been affected by other projects and activities to date. **Addressed in EIS Appendix 7.2-B (#157):** The methods used to assess the potential effects of the Project, including both residual effects of the Project and cumulative effects, are described in EIS Section 8.0 Effects Assessment Methods. These methods are consistent with existing federal guidance. The effects of other projects and activities that have been carried out are reflected in the existing (and expected) conditions of the ICs and VCs, and in EIS Section 32.0. By assessing potential Project-related effects against those conditions, the cumulative effects of the Project and other past projects and activities are inherently considered. The EIS also includes historical data, where available and applicable, to assist interested parties to understand the potential effects, including cumulative effects, of the Project. The EIS does not include an assessment of historical infringements on the ability of Indigenous groups to exercise rights or impacts to traditional use. **Addressed in IR-7.31.15-13 and AIR-12.04.15-13:** In addition to the cumulative effects summaries presented in the EIS and MSA, responses to IR-7.31.15-13 and AIR-12.04.15-13, provide further consideration of how VCs (that may be affected by residual adverse effects of the Project) has been affected by past, present and future projects and activities.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Lands and Resources for Traditional Purposes 32.3 Potential Adverse Impacts on Aboriginal and Treaty Rights and Related Interests Analysis **Information Requests** Response to Information Request #13 (IR-7.31.15-13 of CEAR Document #314) Response to Additional Information Request #13 (AIR-12.04.15-13 of CEAR Document #388)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-6.8	Requested that VFPA provide in the EIS Section 3.3.1 (Valued Components) areas of concern that have been provided by Musqueam to date, as per the requirement of the EISG.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency did not request additional information for this item since there is already information provided in the EIS. Additionally, the EIS guidelines do not require the information to be disaggregated. However, in #30, page 14, the Agency has requested: 'Provide a rationale for the conclusions of the effects assessment for the current use of lands and resources for traditional purposes by Aboriginal peoples where the conclusions are reported as "no effect" or "negligible". Presenting the effects assessment on a per group basis may help clarify the various conclusions.'"	**Addressed in Response to IR-7.31.15-30:** Responses to IR-7.31.15-30 and AIR-12.04.15-30 provide rationale for the conclusions of the effects assessment for Current Use by Indigenous peoples.	**Information Requests** Response to Information Request #30 (IR-7.31.15-30 of CEAR Document #314) Response to Additional Information Request #30 (AIR-12.04.15-30 of CEAR Document #388)
MFN-6.9	Requested that the Proponent provide written documentation indicating when and how it engaged Musqueam in the identification of Valued Components, sub-components and measurable parameters, and what sort of capacity funding it provided to allow Musqueam to engage in this time consuming type of exercise in a meaningful way. Stated that the time scale going back toward a less damaged baseline (a less industrialized marine and terrestrial environment in Musqueam territory) – the "appropriate time scale" for assessment of cumulative change to date – is not established for all VCs in the EIS, nor is the backcast generally temporally deep enough to establish change over time in both the biophysical environment (substantially altered over the past century plus) or related Aboriginal rights infringements.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "Information on Port Metro Vancouver's [the VFPA] interactions with Musqueam is available in the EIS in Appendix 7.2-A: Consultation Activities by Aboriginal Group. The Panel will determine whether it requires additional information or clarification with respect to the adequacy of this information to inform its sufficiency review. Musqueam is encouraged to describe its concerns on VCs, baseline, worldview and so on to the Panel once it has been appointed. The Agency's request for additional information from Port Metro Vancouver [the VFPA] in #8 and #13 (Aboriginal Traditional Knowledge and Cumulative Effects Assessment) may assist in obtaining additional input on these items."	**Addressed in Response to IR-7.31.15-08:** Provides a description of where and how ITK has been used to support the selection of VCs, baseline descriptions, the assessment of effects including the identification of mitigation measures, and in the determination of significance of adverse environmental effects. **Addressed in Response to AIR-12.04.15-13:** In the EIS, the existing conditions (baseline) reflect the conditions of the environment as modified by past development. Further discussion of how the VFPA considered the effects of past, present and future projects is provided in AIR-12.04.15-13, including in that response's Schedules focused on applicable VCs. Taken together, these schedules build on the information provided in the EIS and provide new, more explicit and clear descriptions of how the residual effects of the Project will combine cumulatively with the effects of past and current projects and activities, and with the effects of certain and reasonably foreseeable future projects. **Addressed in Response to IR10-22:** The VFPA's response to IR10-22, as requested by the Review Panel, further discusses the assessment of cultural heritage, potential disruptions or loss of ceremonial and cultural practices, as well as a potential disruption to sense of belonging, identity and spirituality**.** **Additional information provided by the VFPA:** Appendix 7.2-A of the EIS provides written documentation indicating when and how it engaged Musqueam in the identification of Valued Components, sub-components and measurable parameters, and what sort of capacity funding it provided to allow Musqueam to engage in this exercise in a meaningful way.	**EIS** Appendix 7.2-A Consultation Activities by Aboriginal Group **Information Requests** Response to Information Request #8 (IR-7.31.15-08 of CEAR Document #314) Response to Additional Information Request #13 (AIR-12.04.15-13 of CEAR Document #388) Response to Sufficiency Information Request #2 (IR10-02)
MFN-6.10	Requested more temporal backcasting to establish change over time for important marine species, including but not limited to Dungeness crab and all salmon species which travel through our waters. Stated that multi-season Dungeness crab surveys in the Project footprint	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency has requested additional information on this item in its letter of July 31, 2015 to Port Metro Vancouver [the VFPA] (pages 4 and 7, #9 and 13)."	**Addressed in Response to IR-7.31.15-09:** Provides summaries of information that characterise baseline conditions (referred to as existing conditions in the EIS) in LAAs and RAAs for fish and birds, respectively. **Addressed in Responses to IR-7.31.15-13 and AIR-12.04.15-13:** Provides a further discussion of how VCs (that may be affected by residual adverse effects of the Project) has been affected by past projects and activities.	**Information Requests** Response to Information Request #9 (IR-7.31.15-09 of CEAR Document #314) Response to Information Request #13 (IR-7.31.15-13 of CEAR Document #314)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	and LAA must be completed in order to establish an adequate baseline of current conditions for Dungeness crab.				Response to Additional Information Request #13 (AIR-12.04.15-13 of CEAR Document #388)
MFN-6.11	Requested: 1. Please provide a summary of Musqueam comments on VCs, VC-sub- components, process and interactions, disaggregated from those of other First Nations. 2. Where the Proponent has screened out candidate VCs and VC-subcomponent species identified by Musqueam, please provide how the Proponent and the Crown intends to otherwise address project-specific and cumulative effects on such VC and VC- subcomponent species. Stated that the Proponent has screened out substantial contributions from Musqueam regarding candidate VCs and sub-VCs. Requested a summary of Musqueam requests for VCs, process and interactions, disaggregated from those of other First Nations. The Proponent's "determination" noted at left must be put to the test by the Agency and Musqueam with all information transparently displayed. Requested disaggregated information that provides basis of Musqueam concerns, separate from those of other First Nations.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency did not request additional information for this item since there is already information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to Musqueam comments on VCs, VC-sub-components, process and interactions as well as project-specific and cumulative effects on such VC and VC- subcomponent species. Additionally, the EIS guidelines do not require the information to be disaggregated. However, in #30, page 14, the Agency has requested: "Provide a rationale for the conclusions of the effects assessment for the current use of lands and resources for traditional purposes by Aboriginal peoples where the conclusions are reported as "no effect" or "negligible". Presenting the effects assessment on a per group basis may help clarify the various conclusions."	**Addressed in Response to IR-7.31.15-30:** Responses to IR-7.31.15-30 and AIR-12.04.15-30, as requested by the CEA Agency, provide further rationale for the conclusions of the effects assessment for Current Use by Indigenous peoples. **Addressed in Responses to IR10-02, IR10-06, IR10-08, IR10-13, and IR10-15:** The VFPA's responses to IR10-02, IR10-06, IR10-08, IR10-13, and IR10-15, as requested by the Review Panel, further discuss aspects of the current use effects assessment.	**Information Requests** Response to Information Request #30 (IR-7.31.15-30 of CEAR Document #314) Response to Additional Information Request #30 (AIR-12.04.15-30 of CEAR Document #388) Response to Sufficiency Information Request #2 (IR10-02) Response to Sufficiency Information Request #06 (IR10-06) Response to Sufficiency Information Request #08 (IR10-08) Response to Sufficiency Information Request #13 (IR10-13) Response to Sufficiency Information Request #15 (IR10-15)
MFN-6.12	Requested a (disaggregated) clear listing of all Musqueam concerns with the EA process and the Project to date. If such information is not available due to aggregated meetings and insufficient information collection by the Proponent, the CEA Agency should require the Proponent to undertake additional one-to-one meetings with Musqueam prior to the acceptance of the EIS as complete by the CEA Agency staff and Review Panel.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The EIS guidelines do not require the information to be disaggregated. Information on Musqueam concerns has been provided in the EIS, however it appears that Musqueam disagrees with what has been provided by Port Metro Vancouver [the VFPA]. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."		
MFN-6.13	Stated that the Proponent should clarify on the Access Agreements (use, management, and protection)	15-Jun-2015, Letter to the CEA Agency (CEAR	**15-Oct-2015, Letter from the CEA Agency:** "Should Musqueam have any concerns with their Aboriginal Traditional Knowledge, please discuss with the Panel Secretariat prior to	**Additional information provided by the VFPA:** The VFPA has handled Musqueam ITK in accordance with appropriate applicable agreements between Musqueam and the VFPA.	

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	of Musqueam ATK during and after the EA to ensure confidentiality. Please confirm the Access Agreement between Proponent and Musqueam.	Document #241)	submitting Aboriginal Traditional Knowledge information to the review panel process. The Agency expects that any information provided to the Agency or Panel by Port Metro Vancouver [the VFPA] regarding Musqueam Aboriginal Traditional Knowledge is done so in accordance with appropriate agreements between Musqueam and Port Metro Vancouver [the VFPA]."		
MFN-6.14	Stated that the Proponent should be required to ground truth its initial findings on ecosystem zonation in the RAA with ATK holders prior to the EIS being considered complete. Requested that the Proponent include more information on Aboriginal traditional knowledge and perspectives regarding ecosystem health and integrity; this is currently lacking in the draft EIS. Requested that the Proponent indicate sections of the EIS where the Proponent indicates how Musqueam traditional and local knowledge has been used to reach significance determination or, if such information is not present, revise the EIS accordingly.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency has requested additional information on Aboriginal Traditional Knowledge in its letter of July 31, 2015 to Port Metro Vancouver [the VFPA] (page 3, #8)."	**Addressed in Response to IR-7.31.15-08:** Provides a description of where and how ITK has been used to support the selection of VCs, baseline descriptions, the assessment of effects including the identification of mitigation measures, and in the determination of significance of adverse environmental effects. **Addressed in Response to MSA IR-02.24.16-4:** Discusses the application of ITK in the MSA. **Addressed in Response to IR10-02:** The VFPA's response to IR10-02, as requested by the Review Panel, provides further information concerning how available Indigenous knowledge was incorporated into the EIS and MSA.	**Information Requests** Response to Information Request #8 (IR-7.31.15-08 of CEAR Document #314) Response to Additional Information Request #4 (MSA IR-02.24.16-4 of CEAR Document #386) Response to Sufficiency Information Request #2 (IR10-02)
MFN-6.15	Requested either a justification of why observed change by First Nations for factors associated with ecosystem health and integrity is not included in the EIS, or (much preferred) reconsideration by the Proponent of inclusion of these qualitative, context rich ATK materials into a revised EIS, is required.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency has requested additional information regarding Aboriginal Traditional Knowledge in its letter of July 31, 2015 to Port Metro Vancouver [the VFPA] (page 3, #8)."	**Addressed in Response to IR-7.31.15-08:** Provides a description of where and how ITK has been used to support the selection of VCs, baseline descriptions, the assessment of effects including the identification of mitigation measures, and in the determination of significance of adverse environmental effects. **Addressed in Response to IR10-02:** The VFPA's response to IR10-02, as requested by the Review Panel, provides further information concerning how available Indigenous knowledge was incorporated into the EIS and MSA.	**Information Requests** Response to Information Request #8 (IR-7.31.15-08 of CEAR Document #314) Response to Sufficiency Information Request #2 (IR10-02)
MFN-6.16	Requested information regarding how the definition of spatial boundaries have incorporated Musqueam traditional knowledge, traditional and contemporary use information as well as Musqueam ecological, technical and social and cultural considerations.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency has requested additional information on this item in its letter of July 31, 2015 to Port Metro Vancouver [the VFPA] (page 3, #8). Depending on the response from Port Metro Vancouver [the VFPA] to #8 this could be an issue to identify through the Panel's sufficiency review."	**Addressed in Response to IR-7.31.15-08:** Provides a description of where and how ITK has been used to support the selection of VCs (including their spatial boundaries), baseline descriptions, the assessment of effects including the identification of mitigation measures, and in the determination of significance of adverse environmental effects. Response to MSA IR-02.24.16-4 discusses the application of ITK in the MSA. **Addressed in Response to IR10-02:** The VFPA's response to IR10-02, as requested by the Review Panel, provides further information concerning how available Indigenous knowledge was incorporated into the EIS and MSA.	**Information Requests** Response to Information Request #8 (IR-7.31.15-08 of CEAR Document #314) Response to Additional Information Request #4 (MSA IR-02.24.16-4 of CEAR Document #386) Response to Sufficiency Information Request #2 (IR10-02)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-6.17	Requested information showing how Musqueam ATK has factored into decision on temporal boundaries, and also provide rationale where Musqueam advice on temporal boundaries have been received but not incorporated into the EA.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency has requested additional information on this item in its letter of July 31, 2015 to Port Metro Vancouver [the VFPA] (page 3, #8). Depending on the response from Port Metro Vancouver [the VFPA] to #8 this could be an issue to identify through the Panel's sufficiency review."	**Addressed in EIS Section 8.1.3.2:** Notes that temporal boundaries defined for the assessment encompass the periods during which the Project is expected to interact with ICs and VCs via effects pathways. These boundaries were determined based on the Project's temporal limits (i.e., timing and duration), including the major phases of construction (including decommissioning of temporary construction-related facilities) and operation (including maintenance activities). Important temporal characteristics are described in the existing conditions section for each VC. Where relevant, community knowledge and ITK factored into the descriptions of these temporal boundaries. **Addressed in Response to IR-7.31.15-08:** Provides a description of where and how ITK has been used to support the selection of VCs (including their temporal aspects where applicable), baseline descriptions, the assessment of effects including the identification of mitigation measures, and in the determination of significance of adverse environmental effects. Response to MSA IR-02.24.16-4 discusses the application of ITK in the MSA. **Addressed in Response to IR10-02:** The VFPA's response to IR10-02, as requested by the Review Panel, provides further information concerning how available Indigenous knowledge was incorporated into the EIS and MSA.	**EIS** 8.1.3.2 Temporal Boundaries **Information Requests** Response to Information Request #8 (IR-7.31.15-08 of CEAR Document #314) Response to Additional Information Request #4 (MSA IR-02.24.16-4 of CEAR Document #386) Response to Sufficiency Information Request #2 (IR10-02)
MFN-6.18	Stated that spatial boundary for project-specific and cumulative effects on key VCs such as marine resources and CULRTP should account for need for an adequate spatial boundary to consider the effects of linear project components, both marine and terrestrial, (marine shipping, rail and road traffic), as well as the project- specific and cumulative effects (including noise and vibration effects which are not limited to the LAA) on mobile marine species (e.g. fish, migratory birds).	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency has requested additional information on Aboriginal Traditional Knowledge in its letter of July 31, 2015 to Port Metro Vancouver [the VFPA] (page 3, #8). Depending on the response from Port Metro Vancouver [the VFPA] to #8 this could be an issue to identify through the Panel's sufficiency review. Additionally, the Agency is expecting to receive the Marine Shipping addendum from Port Metro Vancouver [the VFPA] which may address some of MFN's concerns on marine shipping. The Marine Shipping addendum will be made available for comment on completeness. Information may be available in this addendum to address other concerns such as mobile marine species."	**Addressed in EIS Section 8.1.3.1:** Spatial boundary selection is discussed in EIS Section 8.1.3.1. Spatial assessment boundaries were identified for each VC based on the spatial characteristics of the Project and the VC (e.g., location, distribution, range), and the areas within which Project-VC interactions and effects are expected to occur. When determining the spatial boundary, the Project team also considered, as applicable, available community knowledge and ITK, information on current land and resource use by Indigenous groups, and other pertinent ecological, technical, social, and cultural considerations, as well as input from government, Indigenous groups, and the public. When the RAA differs from the area in which the residual effects of the Project on the VC are likely to combine with the effects of other projects and activities to result in a cumulative effect on the VC, a fourth type of spatial boundary, the cumulative effects assessment area, is defined. The rationale for selection of the spatial boundaries for the LAA, RAA, and, where applicable, the cumulative effects assessment area, is provided for each VC in the effects assessment sections. **Addressed in MSA Section 6.2.1:** In the MSA, the spatial boundaries of the assessment are discussed in MSA Section 6.2.1. The spatial boundary for the activities associated with marine shipping, referred to as the marine shipping area, is described in MSA Section 4.1 Marine Shipping Area. The effects assessment considers the potential effects of marine shipping associated with the Project on the environment in the context of defined spatial boundaries. Spatial boundaries vary by component and potential interactions of shipping activities with that component, and reflect the following: • Natural distribution of a component or sub-component; • Area in which a component or sub-component functions and within which an effect may be experienced; and	**EIS** 8.1.3.1 Spatial Boundaries **MSA** 6.2.1 Spatial Boundaries **Information Requests** Response to Information Request #8 (IR-7.31.15-08 of CEAR Document #314)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				• Area directly affected by marine shipping activities. The spatial boundaries of the assessment consider the VC-specific LAA or the RAA. The LAA represents the area where the component and associated sub-components are likely to be affected by marine shipping associated with the Project. This is generally represented by a zone or corridor centred on the marine shipping lanes. The RAA provides the regional context for the assessment and, in most cases, also represents the area extending beyond the LAA boundary where the direct and indirect influence of other projects and activities could interact with specific effects of marine shipping associated with the Project, and cause cumulative effects. The extent of, and rationale for, each spatial boundary is provided in each assessment section. **Addressed in Response to IR-7.31.15-08:** Provides a description of where and how ITK has been used to support the selection of VCs, baseline descriptions, the assessment of effects including the identification of mitigation measures, and in the determination of significance of adverse environmental effects.	
MFN-6.19	Stated that due to the failure of the Proponent to collect detailed baseline information from Musqueam, the EIS lacks: • Musqueam-specific information related to preferred harvest timing, methods and locations of Musqueam harvesters/fishers; • Musqueam harvesters'/fishers' views on potential interactions between exercise of rights-based activities and the Project; Musqueam harvesters'/ fishers' views on potential impacts on exercise of rights not currently practiced due to conservation or safety closures but that Musqueam would seek to exercise in the future. Stated that there has been no meaningful research or data collection (of Musqueam Traditional Knowledge or Musqueam views) to serve as basis for correct characterization of "current conditions" baseline information, e.g. • how many vessel hours per year Musqueam are on the water for harvesting purposes; • community-based aspirational harvest quotas, i.e., "sufficiency of resource" to meet Musqueam's food/social/ceremonial requirements; • Musqueam experience of historical and current alienation	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in Responses to IR10-06 and IR10-13:** The VFPA's responses to IR10-06 and IR10-13, as requested by the Review Panel, provide additional information concerning the rationale for the current use effects assessment conclusions. **Addressed in Response to IR-7.31.15-08:** Provides a description of where and how ITK has been used to support the selection of VCs, baseline descriptions, the assessment of effects including the identification of mitigation measures, and in the determination of significance of adverse environmental effects. Response to MSA IR-02.24.16-4 discusses the application of ITK in the MSA. **Additional information provided by the VFPA:** On December 18, 2013, the VFPA and Musqueam signed a funding agreement to support Musqueam's completion of a RBT2-specific use study. On August 19, 2014, Musqueam provided the VFPA with a report titled Draft Contemporary Musqueam Use of the Southern Fraser Delta (Woolman 2014); and on October 7, 2014, Musqueam provided the VFPA with a report titled Traditional Musqueam Use of the Southern Fraser Delta (Ham 2014). The VFPA met with Musqueam on November 19, 2014 to provide information regarding the assessment of potential Project effects and cumulative effects on Current Use; and to identify any additional information to inform the assessment. The presentation and discussion included content regarding the proposed methodology for this assessment, the VFPA's understanding of existing conditions, based on the information provided by Musqueam, and preliminary conclusions of the assessment. On December 9, 2014, the VFPA provided Musqueam with advance drafts of the existing conditions sections for chapters of the EIS: "Potential or Established Aboriginal and Treaty Rights and Related Interests, and including current use of lands and resources for traditional purposes" and "Aboriginal Commercial Fishing and Seafood Harvesting." The VFPA requested that Musqueam confirm the accuracy of the information	**Information Requests** Response to Sufficiency Information Request #06 (IR10-06) Response to Sufficiency Information Request #13 (IR10-13) Response to Information Request #8 (IR-7.31.15-08 of CEAR Document #314) Response to Additional Information Request #4 (MSA IR-02.24.16-4 of CEAR Document #386)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	from areas of Roberts Bank due to industrialization; Musqueam ITK regarding effects of existing causeway terminal on fishery, i.e., reference to lack of tidal flows and increasing sedimentation in both of these areas as primary reason for less productive conditions in these areas, and resultant alienation from fishing grounds.			presented and identify any sensitive information that should be removed from the final EIS. Comments on the draft sections were received from Musqueam on January 15, 2015 and January 23, 2015 respectively, and changes made to the sections as appropriate. The "Aboriginal Commercial Fishing and Seafood Harvesting" section was provided again to Musqueam to confirm the substantial changes made to the section based on Musqueam's comments, and further comments from Musqueam were integrated into the final EIS. On March 26, 2015, the VFPA provided Musqueam with a table outlining all Musqueam's comments on the draft sections, responses to each comment from the VFPA, and a description of subsequent changes made to the sections in the EIS. In response to a request from Musqueam, on March 15, 2016, the VFPA signed a funding agreement to support Musqueam's completion of a marine shipping-specific use study. On May 24, 2016, Musqueam provided the VFPA a study titled Musqueam Marine Shipping Effects Assessment report (Firelight 2016). On June 9, 2016, the VFPA provided Musqueam with the draft existing conditions sections for components considered in the AIMSA (i.e., Human Health, Marine Commercial Use, Outdoor Recreation, Archaeological and Heritage Resources, and Current Use), and requested Musqueam confirm the accuracy of the information presented and identify any sensitive information that should be removed from the final AIMSA. Musqueam provided comments on the documents on July 15, 2016 which were integrated into the draft chapters of the AIMSA as appropriate. On June 20, 2016 the VFPA and Musqueam met to discuss the Musqueam Marine Shipping Effects Assessment report, and the process for integrating this report into the final AIMSA. On August 3, 2016, the VFPA provided the full draft AIMSA for Musqueam's review and comment, including the existing conditions sections shared earlier and all effects assessment chapters, and Musqueam responded with comments on September 15, 2016. Musqueam's comments were integrated into the final AIMSA as appropriate. On September 30, 2016, the VFPA provided Musqueam with a table including all Musqueam's comments on the draft sections, responses to each comment from the VFPA, and a description of subsequent changes made to the sections.	
MFN-6.20	Stated that Section 32 of the EIS does not integrate the ITK of Musqueam fishers, despite their profoundly deep knowledge of the Fraser River Estuary, into the assessment of Project effects.	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information. **05-Dec-2014, Letter from the VFPA:** Committed to providing Musqueam with advance drafts of EIS sections for Musqueam review: • Existing conditions for Current Use for Musqueam; • Existing conditions for proven and asserted Aboriginal rights for Musqueam; and • Existing Socio-Economic conditions for Musqueam (already provided). **09-Dec-2014, Letter from the VFPA:** Shared the draft existing conditions sections.	**Addressed in EIS Section 32.2.4.2 and Response to IR10-06:** The ITK provided to the VFPA by the Musqueam First Nation by the time of EIS submission is summarised in Section 32.2.4.2. Musqueam First Nation representatives reviewed this summary before EIS submission, and their comments were incorporated. **Addressed in Response to IR-7.31.15-08:** Provides a description of where and how ITK has been used to support the selection of VCs, baseline descriptions, the assessment of effects including the identification of mitigation measures, and in the determination of significance of adverse environmental effects. **Addressed in Response to IR10-02:** The VFPA's response to IR10-02, as requested by the Review Panel, provides further information concerning how available Indigenous knowledge was incorporated into the EIS and MSA.	**Information Requests** Response to Information Request #8 (IR-7.31.15-08 of CEAR Document #314) Response to Sufficiency Information Request #2 (IR10-02) Response to Sufficiency Information Request #6 (IR10-06)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			Noted that the draft has incorporated information contained in the two RBT2-related studies (Woolman 2014, Ham 2014) that were provided to the VFPA pursuant to the Traditional Use Study Funding Agreement signed 17-Dec-2013. • Musqueam Current Use; • Musqueam [existing conditions] for proven and asserted Aboriginal rights; and • Indigenous Commercial Fishing and Seafood Harvesting. Stated that it is the VFPA' intention to confirm with Musqueam First Nation that the information contained in this draft is accurately presented and whether any revisions, additions or deletions are required in advance of finalizing and submitting the EIS to the CEA Agency. Stated that in addition to errors and/or omissions, should there be any specific information or reference that should be removed due to sensitivity of content, the VFPA requests that Musqueam inform us of this upon your review to ensure it is excluded from the final EIS. **15-Jan-2015, Email from Musqueam:** Provided comments on EIS Section 32.0, Current Use. **23-Jan-2015, Email from Musqueam:** Provided comments on EIS Appendix 18-B Existing Socio-Economic Conditions of Musqueam First Nation Community. **01-Feb-2015, Email from the VFPA:** Attached the final Existing Conditions of the Musqueam First Nation Community report. Stated that this report has incorporated the changes requested by Musqueam. As previous discussed, now with Musqueam's consent, the attached document will be included in the EIS. **25-Mar-2015, Letter from the VFPA:** Thanked Musqueam for the comments they provided on the draft EIS sections, and provided a tracking table that listed the comments provided by Musqueam, the response provided by [the VFPA], and a description of any subsequent changes made to these documents.		
MFN-6.21	Requested a list of all VCs that were requested by Musqueam and	15-Jun-2015, Letter to the CEA Agency	**15-Oct-2015, Letter from the CEA Agency:** "The EIS guidelines do not require the information to be disaggregated. The Panel will determine whether it requires additional information or clarification with respect to VCs to inform its sufficiency review."	agencies (see EIS Section 7.1.1), Indigenous groups (see EIS Section 7.2.2), and public and local government (see EIS Section 7.3.2). These comment tracking tables include specific references to potential VCs, related processes and interactions, and the nature and sensitivity of the Roberts Bank area during the Project's Pre-EIS submission stage. The comment tracking tables identify the VFPA's response to VC-related comments and provide explanations for those situations in which a particular issue is not addressed by a selected VC or has not been considered in the assessment.	7.1.1 Pre-Environmental Impact Statement Submission Engagement and Consultation 7.2.2 Pre-EIS Submission Consultation Process 7.3.2 Pre-EIS Submission Engagement and Consultation Activities 8.1.1 Issues Scoping 8.1.2 Selection of Valued Components
MFN-6.22	Requested a tabulated set of responses to Musqueam for VCs and related Key Indicators (KI) that includes responses that are specific to Musqueam concerns. Stated that the intention of this exercise will be – prior to the determination of whether the EIS is complete or not – to assess the credibility of the rationale for exclusion of what may be critical VCs. Where the explanations are not credible, Musqueam will call upon the Agency to withhold a finding of completeness until additional VCs can be adopted and fulsomely integrated into a revised EIS.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency did not request additional information for this item since there is already information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to Musqueam comments on VCs, VC-sub-components and related Key Indicators to inform its sufficiency review. A discussion of is more appropriately considered through the Panel's sufficiency review. Additionally, the EIS guidelines do not require the information to be disaggregated."	**Addressed in EIS Section 8.0:** During the Project's EIS preparation stage, comment tracking tables were developed that summarise key comments provided by regulatory agencies (see EIS Section 7.1.1), Indigenous groups (see EIS Section 7.2.2), and public and local government (see EIS Section 7.3.2). These comment tracking tables include specific references to potential VCs, related processes and interactions, and the nature and sensitivity of the Roberts Bank area during the Project's Pre-EIS submission stage. The comment tracking tables identify the VFPA's response to VC-related comments and provide explanations for those situations in which a particular issue is not addressed by a selected VC or has not been considered in the assessment. Issues identified through the scoping process described above informed the selection of appropriate VCs for the Project's effects assessment. The selection of VCs followed a three-step process, which is summarised in EIS Figure 8-1 and described below. Process outcomes, including the rationale for inclusion or exclusion of each candidate VC, is summarised in EIS Appendix 8-A Valued Component Selection Rationale. In addition, each VC effects assessment section provides an account of the VC-specific selection process (see EIS Sections 11.0 to 16.0 for biophysical effects assessments, and EIS Sections 19.0 to 28.0 for the social and economic effects assessments. Although not identified as a VC, the effects of the Project on Current Use were assessed (see EIS Section 32.2).	**EIS** 7.1.1 Pre-Environmental Impact Statement Submission Engagement and Consultation 7.2.2 Pre-EIS Submission Consultation Process 7.3.2 Pre-EIS Submission Engagement and Consultation Activities 8.1.1 Issues Scoping 8.1.2 Selection of Valued Components
MFN-6.23	Requested clarification on 1. How VFPA assumed that CULRTP would not be considered a VC in face of Musqueam concerns; and 2. Implications for the assessment of CULRTP given that this EA has not treated CULRTP as a VC. Musqueam calls for the Agency to require a re- assessment of effects with CULRTP as a VC; if the Agency is not predisposed to this requirement, we call for direct consultation with the Agency so that Musqueam can properly illustrate the need for adoption of CULRTP as a VC, and outline the implications for the defensibility of the EA if this is	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "This appears to be an item better addressed to Port Metro Vancouver [the VFPA] given that they have chosen how to determine and characterize valued components. However, since information has been provided on the topic this is more of a sufficiency issue for the Panel to consider and not a completeness issue. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review. As such, no additional information was asked of VFPA."	**Additional information provided by the VFPA:** The identification of a component as a "Valued Component" (VC) is based on the definition of environmental effects in Section 5 of *CEAA, 2012*, not on whether a component is valued. Section 5 of *CEAA, 2012* identifies factors for which environmental effects must be assessed under that statute, including under subsection 5(1)(c), which relates to the effects of a change to the environment on Indigenous people. If residual effects to these factors are identified, the significance of these residual effects must be determined, and cumulative effects assessed, per Section 19(1) of *CEAA, 2012*. The *EIS Guidelines* identified how Section 5 environmental effects were to be assessed in sections 10.1, 11.1, 12.1, and 13.1. The requirements for the assessment of Section 5 environmental effects do not apply to the assessment of rights. Rather, the requirements for the assessment of potential impacts to the exercise of rights stems from common law requirements relating to the Crown's duty to consult and accommodate. The *EIS Guidelines* lays out the requirements for the rights assessment in sections 9.2, 10.2, 11.2, 12.2 of the Guidelines,	

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	not a requirement put forward to the Proponent.			which are different from those relating to Section 5 factors (as above, sections 9.1, 10.1, 11.1, 12.1, 13.1). The determination of significance and assessment of cumulative effects, while required for Section 5 factors per Section 19(1) of *CEAA, 2012*, are not required for rights (other than indirectly through the assessment of effects on VCs that are linked to the exercise of rights). Current Use is a Section 5 *CEAA, 2012* factor (under subsection 5(1)(c)), and was accordingly assessed using the VC methodology to meet the requirements of the *EIS Guidelines*. In addition, as per *the EIS Guidelines*, the VC methodology was not applied to the rights assessment. Because the Current Use and rights assessments were embedded within the same EIS chapter, but subject to different assessment methods, the chapter was not referred to as a "VC" assessment. This is true even though a portion of the EIS Chapter assessing Current Use used the VC methodology, and the results were applied to the rights assessment.	
MFN-6.24	Stated that there was a lack of incorporation of VC-subcomponent species of high importance to Musqueam cultural, social and right-based activities into the assessment. Stated that the list of VCs, sub-VCs and sub-VC species provided in the EIS does not accurately reflect Musqueam requests for white sturgeon and eulachon to be treated as a sub-VC species of study, as well as several other VCs of concern. Stated that during the scoping phase of the EA, Musqueam placed numerous requests on the record for white sturgeon and eulachon to be directly assessed as standalone VC-subcomponent species. Stated that these two culturally significant species were not directly assessed by the Proponent in the EIS.	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 13.0:** Potential Project-related effects on eulachon have been assessed through the use of representative forage fish species (see EIS Sections 13.6.2.1 and 13.6.3.3). Potential Project-related effects on white sturgeon have been assessed in the EIS through the use of representative Pacific salmon species (see EIS Sections 13.6.2.1, 13.6.2.2, and 13.6.3.1). **Addressed in Response to AIR 12.04.15-09:** AIR 12.04.15-09 outlines in detail the selection process for VCs, Sub-components, and representative species and rationale for selection. Discussion of how sturgeon and eulachon were captured in the assessment (i.e., by proxy) is provided. **Addressed in Response to IR5-15:** In its response to IR5-15, issued by the Review Panel on June 6, 2017 (CEAR Document #975), the VFPA specifically discusses existing conditions related to eulachon and describes the status and management practices associated with the species. Rationale as to how eulachon were assessed via use of Pacific herring and surf smelt as representative species, as well as similarities between species as they pertain to existing conditions (e.g., life history and habitat requirements), the mechanisms through which the Project may affect eulachon, as well as effectiveness of mitigation, are presented in AIR-12.04.15-09 of CEAR Document #388, including Appendix AIR9-A Table 2; and in IR5-15 response (CEAR Document #1078). Potential effects on eulachon (as represented by Pacific herring and surf smelt) are assessed as minor, based on the low potential of eulachon to interact with the Project during terminal construction (adult eulachon presence in the LAA has not been confirmed, and eulachon larvae rear in the Strait of Georgia outside LAA boundaries). With implementation of mitigation measures (including adherence to the crab fisheries sensitive window and implementation of Construction Environmental Management Plans), no loss in eulachon productivity is anticipated. **Addressed in Response to IR5-15:** In its response to IR5-15, issued by the Review Panel on June 6, 2017 (CEAR Document #975), the VFPA specifically discusses existing conditions related to sturgeon and describes the status and management practices associated with the species. Rationale as to how sturgeon were	**EIS** 13.0 Marine Fish **Information Requests** Response to Additional Information Request #9 (AIR-12.04.15-09 of CEAR Document #388) Response to Sufficiency Information Request #15 (IR5-15 of CEAR Document #1078)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				assessed through the use of Chinook and chum salmon as representative species, as well as similarities between species as they pertain to existing conditions (e.g., life history and habitat requirements), the mechanisms through which the Project may affect sturgeon, as well as effectiveness of mitigation, are presented in AIR-12.04.15-09 of CEAR Document #388, including Appendix AIR9-A Table 2; and in IR5-15 response. Effects on Pacific salmon associated with changes in water quality and changes in biotic interactions are considered negligible.	
MFN-6.25	Stated that there was inappropriate use of high-level preliminary overview documents as substitute for proper baseline information. • To date, VFPA has insisted on treating Musqueam's preliminary, partial, and spatially- and scope-constrained reports on contemporary use as the full and final extent of Musqueam input into the Proponent's assessment of Project effects on our Aboriginal rights and current use for traditional purposes. From the beginning, Musqueam has informed the Proponent that these preliminary drafts were intended to provide VFPA with background information to form a starting point for consultations. These preliminary drafts were never intended to be relied upon as a source for assessing impacts to our rights, as VFPA has done in the EIS	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 32.0:** A full list of information sources used to prepare the EIS Section 32.2 existing conditions is presented in EIS Section 32.2.3, including but not limited to Project-specific information provided to the VFPA from Indigenous groups in direct consultation with the VFPA, and review of ITK and studies of Current Use, and traditional use.	**EIS** 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes
MFN-6.26	Stated that Section 32 of the EIS does not meet federal information requirements, as set out in the EIS Guidelines and related federal EA guidance documents, to assess project-specific and cumulative effects on Musqueam Aboriginal rights and associated CULRTP. Concerned around the methodology used for assessing Musqueam's current use of lands and resources for traditional purposes. Concerned about the methodology used to identify mitigation activities and the incorrect analysis on post-mitigation residual effects of the Project. Stated that the immitigable nature of full displacement of MFN's ability to	03-Nov-2016, Letter to Panel (CEAR Document #776) 15-Nov-2017, Letter to Panel (CEAR Document #1098)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 32.1:** Describes how EIS Section 32.0 as a whole analyses potential effects to Current Use and potential adverse impacts to the ability to exercise asserted or established rights in a way that is responsive to both common law requirements regarding asserted and established Aboriginal and treaty rights in Canada, pursuant to Section 35 of the *Constitution Act*, 1982, and the statutory requirements of subsection 5(1) (c) of the *Canadian Environmental Assessment Act (CEAA), 2012*. These common law and statutory requirements are reflected in the *EIS Guidelines* and were addressed by the VFPA in Section 32.2 (statutory requirements for Current Use) and Section 32.3 (common law requirements for rights). Refer to the response to MFN-6.23 in this table. **Addressed in EIS Section 32.2 and responses to IR10-06 through IR10-12:** The VFPA is of the view that potential Project-related effects on Musqueam First Nation's Current Use can be mitigated to a negligible level. A significance determination was only required on measurable residual effects. A cumulative effects assessment was only carried out	**EIS** 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.1 Component Overview and Regulatory Setting 32.2 Current Use of Land and Resources for Traditional Purposes Assessment 32.3 Assessment of Potential Impacts on the Exercise of Asserted or Established Aboriginal and Treaty Rights **Information Requests** Response to Sufficiency Information Request #06 (IR10-06) Response to Sufficiency Information Request #07 (IR10-07)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	exercise the rights-based practice/traditional use, is ignored. Stated that the Proponent has effectively "skipped over" the implications of immitigable residual effects of the Project on Musqueam CULRTP, and has consequently failed to adequately fulfil the EIS Guidelines requirements for: • a cumulative effects assessment on Musqueam CULTRTP; • a significance determination on total Project-specific and cumulative effects on Musqueam CULTRTP; and • a proper consideration of the seriousness of adverse project-specific and • cumulative effects on Musqueam Aboriginal rights and title. Concerned that the EIS' assessment in Section 32, *Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes* ("Section 32"), of Musqueam rights and current use of lands and resources for traditional purposes are inadequate and flawed. Concerned that the EIS assessment fails to provide any "contextual" analysis related to the seriousness of adverse effects on Aboriginal rights or incorporate the Aboriginal perspective, as required under common law. Expressed that marine shipping effects, facility-specific effects, and other cumulative effects causing agents must be considered in combination to understand the net effects on Musqueam rights and current use of lands and resources for traditional purposes ("CULRTP").			when a residual adverse effect of the Project (regardless of significance) was predicted and the residual adverse effect was considered likely to interact cumulatively with the effects of other projects and activities that have been or will be carried out. Refer to the response to MFN-6.1 in this table. **Addressed in EIS Section 32.3:** The EIS specifically acknowledges, in Section 32.3.2.2, a potential impact to the Musqueam First Nation's ability to exercise the asserted Aboriginal right to harvest crab for food, social, or ceremonial purposes based on potential changes in access to a primary crab harvesting location. This impact is expected to be accommodated by the measures identified in Sections 32.3.2.2 and 32.3.3 to avoid, reduce or otherwise address predicted impacts on the exercise of rights.	Response to Sufficiency Information Request #08 (IR10-08) Response to Sufficiency Information Request #09 (IR10-09) Response to Sufficiency Information Request #10 (IR10-10) Response to Sufficiency Information Request #11 (IR10-11) Response to Sufficiency Information Request #12 (IR10-12)
MFN-6.27	Requested that the following be documented collaboratively with the Indigenous group: a. Potential Project-specific and cumulative impacts on Musqueam lifestyle, culture, governance and quality of life of Indigenous people, including elements of cultural or spiritual importance	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Additional information provided by the VFPA:** The VFPA has reviewed this letter and understands it to be directed to the Panel. The VFPA has no further information to provide.	

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	regarding Indigenous groups' connections to water and land, transfer of knowledge, and customs, traditions or practices; b. Potential Project-specific and cumulative impacts on the ability of Musqueam to practice rights at preferred locations and in their preferred manner, including, for example, how the predicted increase in traffic and ship calls at the Roberts Bank Terminal may change the ability of Indigenous groups access to areas like the Tsawwassen foreshore, Canoe Pass and the Fraser River for the exercise of rights; c. an updated analysis of the potential impacts on the exercise of rights that are not currently practiced by Indigenous groups, such as the harvesting of shellfish, which cannot be harvested due to sanitary closures, or the harvesting of any species which is not currently harvested due to conservation concerns. d. the views of each Indigenous group on the conclusions made by the Proponent with respect to: i. potential impacts of the Project and marine shipping associated with the Project on rights; and ii. the seriousness of such potential impacts to rights.				
MFN-6.28	Requested a description of the extent to which existing and reasonably foreseeable future development is affecting each Indigenous group's ability to practice their rights within the proposed Project and marine shipping area(s).	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 32.0 and AIMSA – MFN and TWN Section 7.0:** Descriptions of Musqueam First Nation's perspectives on existing impacts to Musqueam's ability to exercise asserted or established rights from existing projects and activities is captured in EIS Section 32.2.4.2 and AIMSA Section 7.2.1. The Project is expected to impact Musqueam First Nation's ability to exercise the asserted Aboriginal right to harvest crab for food, social, or ceremonial purposes. This impact is expected to be accommodated by the measures identified in Section 32.3.3 to avoid, reduce or otherwise address predicted impacts on the exercise of rights. Marine shipping associated with the Project is expected to result in a negligible-to-minor impact on Musqueam's access to locations within the marine shipping area for the exercise of asserted rights (AIMSA Section	**EIS** 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes 32.3 Assessment of Potential Impacts on the Exercise of Asserted or Established Aboriginal and Treaty Rights **AIMSA – MFN and TWN** 7.0 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				7.8.2). This impact is expected to be accommodated by the measures suggested by the VFPA in AIMSA Section 7.8.3.	7.2.1 Musqueam First Nation, Existing Conditions 7.8.2 Results of the Rights Assessment 7.8.3 Suggested Mitigation Measures
MFN-6.29	Musqueam submitted a copy of the *Musqueam Knowledge and Use Study of the Roberts Bank Terminal 2 Project* to the Review Panel for consideration in the evaluation of the Project's potential impacts on Musqueam rights and current use of lands and resources for traditional purposes ("CULRTP"). The Study concluded that the Project is likely to result in residual adverse effects to Musqueam lands and waters, use of lands and waters, practice of Aboriginal rights (including culture), and Musqueam well-being.	15-Nov-2017, Letter to Panel (CEAR Document #1098)	The VFPA has reviewed this letter and provides the following additional information.	**Additional information provided by the VFPA:** This study referred to by Musqueam in the comment was funded by the VFPA after the submission of the EIS, and specifically to provide baseline information for Musqueam in relation to marine shipping associated with the Project (i.e., for the AIMSA). Most of the information presented in the study pertained to the Project and less to marine shipping associated with the Project. Moreover, the information pertaining to the Project was, in the VFPA's view, largely consistent with the content presented for Musqueam in EIS Section 32.2.4.2, which was based on an earlier Project-specific study completed by Musqueam. These points of consistency are identified in the existing conditions summary for Musqueam in AIMSA Section 7.2.1. The VFPA recognises and respects that Musqueam First Nation may not agree with the VFPA's predictions of negligible residual effects on Current Use (and the exercise of asserted or established Musqueam rights).	**EIS** 32.2 Current Use of Land and Resources for Traditional Purposes **AIMSA – MFN and TWN** 7.2.1 Musqueam First Nation, Existing Conditions
MFN-6.30	Requested that the Panel issue a formal Information Request to VFPA to assess cumulative effects related to Musqueam's CULRTP, and that this request be required to be fully addressed by the Proponent prior to proceeding to public hearings.	15-Nov-2017, Letter to Panel (CEAR Document #1098)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 32.0:** Presents assessment required by the *Updated EIS Guidelines* related to Aboriginal rights and Current Use. Refer to the response to MFN-6.23 in this table regarding the different methods used to assess Current Use and rights. **Addressed in the Responses to IR10-06 through IR10-12:** A cumulative effects assessment was only carried out when a residual adverse effect of the Project (regardless of significance) was predicted and the residual adverse effect was considered likely to interact cumulatively with the effects of other projects and activities that have been or will be carried out. Refer to the response to MFN-6.1 in this table for the methods applied VC assessments, which were also applied to Current Use.	**EIS** 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes **Information Requests** Response to Sufficiency Information Request #06 (IR10-06) Response to Sufficiency Information Request #07 (IR10-07) Response to Sufficiency Information Request #08 (IR10-08) Response to Sufficiency Information Request #09 (IR10-09) Response to Sufficiency Information Request #10 (IR10-10) Response to Sufficiency Information Request #11 (IR10-11) Response to Sufficiency Information Request #12 (IR10-12)

Table 7: Engagement and Consultation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-7.1	Concerned with the time requirements for consultation with VFPA on RBT2, and criticism of short CEA Agency timelines. Requested more information related to the timing of the EA process and Review Panel.	18-Oct-2013, Meeting 21-Apr-2017, Phone call	**18-Oct-2013, Meeting:** Stated that the VFPA does not have control over CEA Agency timeframes, but does have control over VFPA-led consultation and can work with Musqueam to develop a process that is mindful of such concerns. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. **21-Apr-2017, Phone call:** Undertook to see if more information is available. **24-Apr-2017, Email from the VFPA:** Stating the Project team does not have the information requested and suggested contacting the Review Panel Manager, for whom contact information was provided.	**Addressed in EIS Appendix 7.2-B (#15):** Since January 2011, the VFPA has consulted with Indigenous groups regarding Project planning, components and activities, selection of VCs, the potential effects of the Project, proposed mitigation measures, and potential changes to the environment related to the Project. The VFPA also held technical workshops with Indigenous groups at which the VFPA and technical specialists engaged directly with members of Indigenous groups, discussing specific areas of Indigenous interest and reviewing related technical topics. The intent of the fall 2014 workshops, as described in EIS Section 7.2.2 and detailed in EIS Appendix 7.2-A, was to provide preliminary EIS results and proposed mitigations and obtain feedback in a simplified presentation and plain language format. Materials were provided to Indigenous groups approximately two weeks in advance of workshops, to provide time to read the material so that questions and comments could be raised in the workshops. The VFPA also provided an opportunity to provide further comment following the workshops. Most questions asked during consultation are addressed in this appendix. Some questions, comments and requests were addressed at the workshops or through follow up communications. The process identified for responding to Indigenous interests and/or issues is provided in the EIS. The VFPA continues to be open to hear concerns and will notify Indigenous groups when the EIS is submitted. **Additional information provided by the VFPA:** Timelines associated with the Federal EA process are set in the *CEAA, 2012*. The CEA Agency has met separately with Musqueam to allow for an opportunity to discuss and raise concerns about the process.	**EIS** 7.0 Engagement and Consultation 7.2.2 Pre-EIS Submission Consultation Process Appendix 7.2-A Consultation Activities by Aboriginal Group Appendix 7.2-B Aboriginal Groups Interests and Issues Table
MFN-7.2	Concerned that VFPA's commitment to build a relationship with Musqueam has not progressed to date and is not adequate. Requested that this message be taken to VFPA.	18-Oct-2013, Meeting	**18-Oct-2013, Meeting:** Acknowledged that building relationships take time. The VFPA is committed to a relationship with Musqueam, noting that discussions relating to the broader relationship extend beyond the timeframe of this EA process. The VFPA is involved with projects in the Port's jurisdiction, and would like to do so in a way that is the best for the Musqueam community.	**Additional information provided by the VFPA:** The VFPA remains committed to working with Musqueam to build a productive and positive working relationship and welcomes further discussion with Musqueam with respect to this matter. On 04-Sep-2018, the VFPA and Musqueam signed a RBT2 Negotiation Protocol Agreement. The VFPA and Musqueam agree to work together to negotiate in good faith a Mutual Benefits Agreement for the Project.	
MFN-7.3	Stated that what is said in the meeting is preliminary and is not to be used in the EIS unless reviewed and approved by Musqueam.	19-Nov-2014, Health & Aboriginal Rights Workshop - MFN	**19-Nov-2014, Workshop:** Agreed to share the record from this meeting with Musqueam for review. Requested that Musqueam review the record to advise of items that should not be included.	**Additional information provided by the VFPA:** The VFPA's records of questions raised in the workshops were provided to Musqueam on November 3, 2014. A full record of questions and answers from the workshop was sent to Musqueam on April 19, 2016. The VFPA did not use any information provided by Musqueam unless they approved. Musqueam was provided with a draft of their current use profile for review and comment before submittal of the EIS. The VFPA also discussed issues and	

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				concerns attributed to Musqueam in the EIS with Musqueam prior to submittal of the EIS. Further to Musqueam's request for review of draft statements proposed for inclusion in the EIS regarding Musqueam and/its Aboriginal rights, and in follow up to the VFPA's December 5th letter, the VFPA provided Musqueam with an advance draft of the sections "Potential or Established Aboriginal and Treaty Rights and Related Interests, and including current use of lands and resources for traditional purposes" (with accompanying map) and "Aboriginal Commercial Fishing and Seafood Harvesting" for review and comment. At Musqueam's request, an extension was provided to ensure Musqueam was able to review the content. Musqueam provided comments on January 15, 2015.	
MFN-7.4	Stated that the pace of information is quick given that not all participants attended previous meetings and workshops. Concerned that the format isn't meaningful and that presenters are not able to answer all questions.	19-Nov-2014, Health & Aboriginal Rights Workshop - MFN	**19-Nov-2014, Workshop:** Acknowledged that the presenters may not have answers to all the questions posed, but will answer to the best of their ability at the workshop. For those questions not answered in person, the VFPA will provide written answers after the workshop. The VFPA is open to receiving questions and feedback in whatever format Musqueam prefers including after the workshop.	**Additional information provided by the VFPA:** Presentations were continuously modified based on feedback received during meetings and workshops. Areas where there were more questions or concerns, additional workshops were scheduled. The VFPA provided a workshop on crabs and the proposed crab closure on August 22, 2016 and February 23, 2017. The VFPA held issues workshops with Musqueam on July 19, 2016 and September 12, 2016 regarding topics of interest to Musqueam, including coastal geomorphology, eulachon, crab, salmon, fisheries, and human health. Technical experts were available at these workshops to respond to questions.	
MFN-7.5	Requested that consultation continue even if agreement on an Impact Benefit Agreement "IBA" is not reached.	29-Jun-2015, Meeting	**29-Jun-2015, Meeting:** Stated that ongoing consultation will occur with or without an IBA, through the review process, permitting and approvals process and with regard to mitigation.		
MFN-7.6	Requested that TC, DFO, and the CEA Agency attend consultation meetings with Musqueam.	22-Jan-2016, Meeting	**22-Jan-2016, Meeting:** Recorded comment for consideration by the Project team.	**Additional information provided by the VFPA:** The VFPA advised the CEA Agency of Musqueam's request at a meeting in Ottawa on 26-Jan-2016.	
MFN-7.7	Concerned that Musqueam is lumped in the EIS with other First Nations. Concerned with the approach taken by VFPA on consultation with such a large number of groups. Criticised the workshop format and requested for one-on-one meetings. Requested that future workshop be held with Musqueam representatives only.	08-Jan-2015, Meeting 29-Jun-2015, Meeting 22-Jan-2016, Meeting 15-May-2017, Phone call	**08-Jan-2015, Meeting:** Noted that since Musqueam raised this issue last, it has only met with Musqueam one-on-one. **29-Jun-2015, Meeting:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. **22-Jan-2016, Meeting:** Recorded comment for consideration by the Project team. **15-May-2017, Phone call:** Undertook to schedule the subsequent workshop with Musqueam only.	**Addressed in EIS Section 7.2:** The CEA Agency identified the Indigenous groups that may potentially be affected by the Project and listed them in the *EIS Guidelines*. The CEA Agency also determined the depth of the duty to consult with each Indigenous group, and Musqueam was consulted as part of this process. The CEA Agency identified Musqueam as requiring a "high" depth of consultation. As described in EIS Section 7.2 and EIS Appendix 7.2-A, the VFPA has consulted with Musqueam in the same fashion as Tsawwassen First Nation, which was also identified by the CEA Agency as requiring high consultation.	**EIS** 7.0 Engagement and Consultation 7.2 Aboriginal Engagement and Consultation 7.2.1.2 Identification of Aboriginal Groups Appendix 7.2-A Consultation Activities by Aboriginal Group

			12-Jun-2017, Phone call: The VFPA and Musqueam confirmed details for the workshop scheduled for 16-Jun-2017. **16-Jun-2017, Workshop:** The VFPA held a workshop with Musqueam representatives only that provided a Project update and included the topics of crab mitigation and habitat offsetting or on-site mitigation.		
MFN-7.8	Requested to review the draft EIS sections of importance to Aboriginal groups, prior to submission of the EIS.	17-Nov-2014, Meeting 19-Nov-2014, Health & Aboriginal Rights Workshop - MFN	**05-Dec-2014, Letter from the VFPA:** Committed to providing Musqueam with advance drafts of EIS sections for Musqueam review: • Existing conditions for Current Use for Musqueam; • Existing conditions for proven and asserted Aboriginal rights for Musqueam; and • Existing Socio-Economic conditions for Musqueam (already provided). **09-Dec-2014, Letter from the VFPA:** Shared the draft existing conditions sections: • Musqueam Current Use; • Musqueam [existing conditions] for proven and asserted Aboriginal rights; and • Indigenous Commercial Fishing and Seafood Harvesting. **15-Jan-2015, Email from Musqueam:** Provided comments on EIS Section 32.0, Current Use. **23-Jan-2015, Email from Musqueam:** Provided comments on EIS Appendix 18-B Existing Socio-Economic Conditions of Musqueam First Nation Community. **01-Feb-2015, Email from the VFPA:** Attached the final Existing Conditions of the Musqueam First Nation Community report. Stated that this report has incorporated the changes requested by Musqueam. As previous discussed, now with Musqueam's consent, the attached document will be included in the EIS. **25-Mar-2015, Letter from the VFPA:** Thanked Musqueam for the comments they provided on the draft EIS sections, and provided a tracking table that listed the comments provided by Musqueam, the response provided by [the VFPA], and a description of any subsequent changes made to these documents.		
MFN-7.10	Stated that Musqueam does not view today's meeting or any past meetings about the RBT2 Project as consultation. Rather, they are information sharing, exchanging and gathering sessions only. Expressed disconnect between the consultation Musqueam feels it is having	07-Oct-2014, Preliminary EIS Results Workshop #1 29-Oct-2014, Preliminary EIS	**07-Oct-2014, Workshop:** Recorded comment for consideration by the Project team. **29-Oct-2014, Workshop:** Recorded comment for consideration by the Project team. **17-Nov-2014, Meeting:**	**Additional information provided by the VFPA:** This concern has been noted in the EIS. Musqueam was involved in pre-consultation for the Project as described in EIS Section 7.2.2. The VFPA has consulted with Musqueam in individual and group settings, and Musqueam has been provided with the opportunity to consult according to their preference. The	**EIS** 7.0 Engagement and Consultation 7.2.2 Pre-EIS Submission Consultation Process

	to date with the CEA Agency's assessment of Musqueam to be on the deep end.	Results Workshop #4 17-Nov-2014, Meeting 19-Nov-2014, Health & Aboriginal Rights Workshop – MFN	Stated that the VFPA believes consultation has occurred and asks how Musqueam would like consultation to proceed. **05-Dec-2014, Letter from the VFPA:** Meetings as "Consultation" or information sharing as discussed above, PMV's [the VFPA] primary objective in engagement with Musqueam is to build a successful, long-term relationship based on mutual trust and understanding. A secondary objective, in PMV's [the VFPA] role as the Proponent of the Project, is undertaking engagements with Indigenous peoples and to gather information to inform the EA process. This latter engagement is undertaken at the direction of the CEA Agency and in the context of the regulatory process to which PMV [the VFPA] and the Project are subject. For example, section 9.2 of the *EIS Guidelines* states: "For the purposes of developing the EIS, the proponent will engage with Aboriginal groups whose potential or established Aboriginal or Treaty Rights and related interests may be affected by the project. In preparing the EIS, the proponent will ensure that Aboriginal groups have access to timely and relevant information that they require in respect of the project and how the project may adversely impact them." **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	VFPA will continue to engage with Musqueam regarding a potential Terms of Reference with regards to consultation. **Addressed in EIS Appendix 7.2-B (#15):** Since January 2011, the VFPA has consulted with Indigenous groups regarding Project planning, components and activities, selection of VCs, the potential effects of the Project, proposed mitigation measures, and potential changes to the environment related to the Project. The intent of the fall 2014 workshops, as described in EIS Section 7.2.2 and detailed in EIS Appendix 7.2-A, was to provide preliminary EIS results and proposed mitigations and obtain feedback in a simplified presentation and plain language format. Materials were provided to Indigenous groups approximately two weeks in advance of workshops, to provide time to read the material so that questions and comments could be raised in the workshops. The VFPA also provided an opportunity to provide further comment following the workshops. Most questions asked during consultation are addressed in this appendix. Some questions, comments and requests were addressed at the workshops or through follow up communications. The process identified for responding to Indigenous interests and/or issues is provided in the EIS. The VFPA continues to be open to hear concerns and will notify Indigenous groups when the EIS is submitted.	Appendix 7.2-A Consultation Activities by Aboriginal Group Appendix 7.2-B Aboriginal Groups Interests and Issues Table
MFN-7.11	Requested funding to participate in consultation activities. Requested funding to complete the draft TUS prepared for the EIS. Stated that it is Musqueam view that the previous report is preliminary, and not comprehensive of Musqueam use. Stated that initial funding and timing were insufficient. Stated that MFN can't keep up with technical team without resources to support their review. Requested a core funding/ Protocol Agreement with VFPA to cover RBT2 and all other projects and funding for a staff position responsible for handling all VFPA referrals. Requested overarching Protocol Agreement with VFPA to include capacity funding to cover the next three years. Requested capacity funding to cover EA technical support, an Aboriginal Rights,	14-Nov-2012, Meeting 30-Aug-2013, Meeting 18-Oct-2013, Meeting 24-Mar-2014, Letter 19-Nov-2014, Health & Aboriginal Rights Workshop – MFN 13-Oct-2015, Letter 22-Jan-2016, Meeting 28-Jan-2016, Letter 29-Feb-2016, Letter 08-Mar-2016, Letter	**14-Nov-2012, Meeting:** Recorded comment for consideration by the Project team. **30-Aug-2013, Meeting:** Recorded comment for consideration by the Project team. **18-Oct-2013, Meeting:** Committed to taking these concerns back to the Port. With respect to the projects related to CCIP, the VFPA initiated discussions in 2011 and that Musqueam are fully engaged and aware of all things happening with RBT2, Habitat Banking, Trade Areas projects and DTRRIP. Asked if there was something it could offer today that could support activities in the interim, before a larger agreement is worked out. **22-Jan-2016, Meeting:** Responded the VFPA could not offer that amount of funding. Requested more information about the level of effort and support required to undertake a marine shipping study. Asked for more information on what rights are being impacted and what current use activities Musqueam has in the marine shipping area. With this information the VFPA	**Additional information provided by the VFPA:** In 2013, the VFPA provided funding for a TUS and additional funding for Musqueam's participation. The VFPA and Musqueam signed an agreement on 17-Dec-2013, in which the VFPA agreed to provide Musqueam funding for a final Musqueam TUS. Musqueam provided the VFPA with Traditional Musqueam Use of the Southern Fraser Delta (Leonard Ham 2014) on 07-Oct-2014 and Contemporary Musqueam Use of the South Fraser Delta (Jason Woolman 2014) on 19-Aug-2014. On 31-Jul-2014, the VFPA responded to Musqueam letter of 24-Mar-2014 and offered funding for RBT2 for the period 01-Aug-2014 to 31-Mar-2015. On 22-Aug-2014, Musqueam requested additional funds; the VFPA agreed to the amount requested by Musqueam but Musqueam did not accept the terms of the agreement. Discussions around an overarching Protocol Agreement between Musqueam and the VFPA stalled in 2014 and did not resume. On 11-May-2015, the VFPA offered Musqueam participation funding for RBT2, which was accepted and provided. In response to Musqueam's request of 13-Oct-2015 for funding, at a meeting on 16-Oct-2015 and in a letter on 25-Nov-2015, the VFPA offered funding to support Musqueam's ongoing	**Musqueam Knowledge Studies** Contemporary Musqueam Use of the South Fraser Delta Preliminary Draft (Woolman, J., 2014) Traditional Musqueam Use of the Southern Fraser Delta (Ham, L., 2014) Musqueam First Nation Marine Shipping Effects Assessment Port Metro Vancouver's Proposed Roberts Bank Terminal 2 Project (Tam, J. and R. 	Interests and Use Study, and Marine Shipping. Requested capacity funding to include a cumulative effects assessment and marine shipping study. Requested funding for RBT2 EA participation and engagement funding. Rejected offer of funding for marine shipping study de-coupled from other funding requests. Accepted offer of funding for marine shipping effects assessment noting requirement of additional funding to facilitate engagement on the Project. Requested a facility-specific Aboriginal Rights, Interests and Use Study (ARIUS). Stated that it is Musqueam's understanding the Agency has also noted this gap and has requested that a proper assessment (including proper characterizing of baseline and effects) be conducted of effects on Musqueam CULRTP. Requested additional funding; funding provided to date is inadequate for a group identified on the "high" end of the consultation spectrum. Requested that an Aboriginal Rights, Interests, and Use Study (ARIUS) that addresses both Project-specific and cumulative effects on Musqueam Aboriginal rights and associated CULRTP. Reiterated need for ARIUS and consideration of cumulative effects on MFN current use of lands and resources for traditional purposes and Aboriginal rights and interests. Requested funding to cover costs associated with hosting upcoming workshops. Requested that the Proponent be required to fund and initiate collaborative work with Musqueam as soon as possible, with the objective of providing this information as a supplemental filing to the Panel by a mutually determined deadline. Stated the funding offered to date has been allocated already and requested VFPA fund upcoming meetings and workshops and consider providing additional funding for review of	15-Mar-2016, Letter 23-May-2016, Letter & Musqueam Marine Shipping Effects Assessment 14-Jun-2016, Letter 20-Jun-2016, E-mail 29-Jun-2016, E-mail 10-Aug-2016, Meeting with Administrative Staff 16-Oct-2016, Meeting 03-Nov-2016, Letter to Panel (CEAR Document #776) 25-Jan-2017, Phone call 27-Jun-2017, Meeting with Administrative Staff 04-Jul-2017, Phone call 06-Jul-2017, Phone call 10-Jul-2017, E-mail 07-Jul-2017, Meeting 18-July-2017, Meeting	can undertake an addendum assessment on those activities. Committed to formally responding to a written request. Stated that the VFPA has no concern with Musqueam completing the traditional use report. No draft reports from any Indigenous groups were made public. The assumption is that Musqueam does not want the final report put on the registry. Requested a final report in accordance with the agreement with Musqueam. **08-Apr-2016, Letter from the VFPA:** The VFPA does not view the proposed Project-specific work to be warranted, as Musqueam previously provided two reports to the VFPA related to Musqueam contemporary and traditional use ln the Project area (Woolman 2014 and Ham 2014). Information from these reports was included in the EIS, which was submitted to the CEA Agency in March 2015. The VFPA is in discussions with Musqueam regarding the provision of additional participation and study funding, and has agreed to pay [amount redacted] to Musqueam for a marine shipping study. **07-Jul-2016, Letter from the VFPA:** Reiterated its view that an ARIUS is not warranted given the two reports previously submitted by Musqueam for the Project, and its determination that assessment of cumulative effects has been completed and can be found in the EIS. Noted supplemental information on cumulative effects may be found in VFPA responses to IR-7.31.15-13 and AIR-12.04.15-13. **21-Jun-2016, Email from the VFPA:** Requested estimate of cost of hosting workshop for consideration. **05-Jul-2016, Email from the VFPA:** Agreed to cost estimate for hosting upcoming workshop. **10-Aug-2016, Meeting:** Undertook to share the request for funding. **25-Jan-2017, Phone call:** Responded funding has been provided to support Musqueam review of draft consultation plan. **04-Jul-2017, Phone call:** Undertook to further discuss impending Musqueam request for additional funding upon receipt of request in writing. **10-Jul-2017, Email from the VFPA:** Responded it would be helpful to discuss the request for funding and requested to meet. **18-Jul-2017, Meeting:**	involvement in the consultation process for RBT2. The funding was not accepted. At a meeting on 22-Jan-2016, Musqueam indicated that they would require additional participation funding, and on 28-Jan-2016, Musqueam followed up with a written proposal requesting funding for Musqueam leadership and staff costs, funding for internal community meetings, funding for EA and consultation technical support, funding for Musqueam marine shipping effects assessment, and funding for Aboriginal Rights, Interests and Use Study (ARIUS). On 12-Feb-2016, the VFPA responded and offered Musqueam funding for a marine shipping study (as requested), and indicated the VFPA is considering the remainder of the proposal. Musqueam rejected the offer on 29-Feb-2016. On 02-Mar-2016 responded to Musqueam letter of 29-Feb-2016 asking Musqueam to reconsider its rejection of the VFPA's funding offer for marine shipping effects assessment. On 08-Mar-2016 Musqueam accepted the VFPA offer of funding for marine shipping effects assessment. Accordingly, on 11-Mar-2016 the VFPA sent a funding agreement which was signed by Musqueam on 15-Mar-2016. On 08-Apr-2016 responded to the remainder of Musqueam's funding requests of 28-Jan-2016 (leadership and staff costs, internal community meetings, EA and consultation technical support and ARIUS) with an offer of funding for leadership and staff costs. On 23-May-2016 Musqueam reiterated the need for ARIUS and consideration of cumulative effects on Musqueam Current Use. On 14-Jun-2016 Musqueam accepted the funding offer for leadership and staff costs as an interim measure for additional resources. Leading up to the Issues Workshops of 19-Jul-2016 and 12-Sep-2016, and RBT2 Community Open House of 21-Nov-2016, the VFPA agreed to cover Musqueam costs of hosting the events, to be payable upon receipt of invoice. Subsequently invoices were issued by Musqueam and paid by the VFPA. On 07-Jul-2016 responded to Musqueam letters of 23-May-2016 and 14-Jun-2016 reiterating its view that an ARIUS is not warranted given the two reports previously submitted by Musqueam for the Project, and its determination that assessment of cumulative effects has been completed and can be found in the EIS. Noted supplemental information on cumulative effects may be found in VFPA responses to IR-7.31.15-13 and AIR-12.04.15-13. Enclosed funding agreement. Musqueam signed the funding agreement on 15-Jul-2016. Met on 17-Jul-2017 and discussed Musqueam request for additional capacity funding sent 10-Jul-2017. The VFPA asked how Musqueam had utilised previous funding, noting the amount agreed to that is inclusive of items proposed in the recent request. The VFPA and Musqueam discussed agreed to activities per the consultation plan. The VFPA requested a separate item linked to deliverables and for scope to be provided for the requested studies; Musqueam to make revisions and send to the VFPA. **Addressed in EIS Section 32.0:**	

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	documents such as the draft consultation plan. Expressed funding provided to date is inadequate based on what MFN has determined their needs to be and that the EA process has taken longer than expected; consultation activities are more numerous than expected. Requested funding for technical meetings, boat tours, legacy benefits discussions and comments, engagement and information sharing meetings, review of permits and information requests, ARIUS, cumulative impacts study. Indicated they would not be providing comments/input in writing until the 10-Jul-2017 request for additional capacity funding had been sorted out.		Requested Musqueam provide something to the VFPA showing how the amount agreed to in July 2016 had been spent to-date given the funding was intended to cover costs of consultation activities outlined in the recent request. Musqueam undertook to do so.	Presents assessment required by the *Updated EIS Guidelines* related to Aboriginal rights and Current Use. **Further information provided by the VFPA:** Refer to the response to MFN-6.23 in the table above regarding the different methods used to assess Current Use and rights.	
MFN-7.12	Requested a boat tour of the Project area. Stated that the boat tour is intended to show VFPA some areas of importance that have been traditionally and are currently used by Musqueam; purpose is information collecting, and to provide another way in which Musqueam can raise concerns regarding the Project. Information and concerns raised by Musqueam at the boat tour are not exhaustive; site visit is not intended for Musqueam to provide an impact statement or to suggest mitigation measures. Requested electronic copies of the materials provided in hard copy at boat tour. Requested second boat tour of the Project area for other representatives.	21-Apr-2017, Phone call 12-Jun-2017, Letter 13-Jun-2017, Phone call 16-Jun-2017, Meeting with Administrative Staff	**21-Apr-2017, Phone call:** Undertook to coordinate a boat tour of the Project area. **26-Apr-2017, Email from the VFPA:** Followed up on the recent phone call and request. Asked Musqueam to provide some options for preferred date/time and advise of the number of attendees expected. **15-May-2017, Email from the VFPA:** Discussed scheduling the boat tour for the week of 12-Jun-2017 with Musqueam. **28-May-2017, Email from the VFPA:** Requested a call to discuss and confirm plans for the boat tour planned for 12-Jun-2017. **07-Jun-2017, Email from the VFPA:** Requested Musqueam confirm attendees for the boat tour. **09-Jun-2017, Email from the VFPA:** Summarised logistics for the boat tour and provided a map showing pick-up and drop-off locations. **12-Jun-2017, Boat Tour:** Attended a boat tour of Roberts Bank with Musqueam. **13-Jun-2017, Email from the VFPA:** Provided electronic copies of materials from the boat tour and committed to help coordinate a second boat tour of the Project area. **20-Jun-2017, Phone call:** Confirmed plans for the second boat tour scheduled for 10-Jul-2017. **06-Jul-2017, Email from the VFPA:** Summarised logistics for the second boat tour and provided a map showing pick-up and drop-off locations.		

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			10-Jul-2017, Boat Tour: Attended second boat tour of Roberts Bank with Musqueam.		
MFN-7.13	Requested a lunch and learn with staff on the topic of the Project.	21-Apr-2017, Phone call	**21-Apr-2017, Phone call:** Undertook to coordinate a lunch and learn on the Project. **26-Apr-2017, Email from the VFPA:** Followed up on the recent phone call and request. Asked Musqueam to provide some options for preferred date or time and suggested additional discussion to determine lunch and learn topics of interest to Musqueam. **08-May-2017, Email from the VFPA:** Discussed potential topics of interest (fish and fish habitat and mitigation such as eelgrass site) and scheduling the event in early June. Agreed to have the lunch catered by a Musqueam member, to be paid for by the VFPA. **13-Jun-2017, Email from the VFPA:** Stated that the Lunch and Learn is tentatively scheduled for 10-Jul-2017 and requested confirmation. **26-Jun-2017, Phone Call:** Discussed RBT2 consultation activities. Musqueam indicated preference to postpone the Lunch and Learn until September 2017; agreed to do so. **27-Jun-2017 Meeting:** Met with Musqueam and confirmed VFPA understanding of Musqueam preference to postpone the Lunch and Learn to September 2017. [Musqueam will inform the VFPA of when they would like to hold a Lunch and Learn].		
MFN-7.14	Stated that it is unreasonable, and at odds with meaningful consultation, to fire off information demand letters in regards to marine shipping. Stated that VFPA knows that Musqueam is constrained for capacity. Concerned with limitations associated with the timeline and budget for the Musqueam Marine Shipping Effects Assessment.	11-Dec-2015, Letter 20-Jun-2016, Meeting	**11-Dec-2015:** Recorded comment for consideration by the Project team. **20-Jun-2016, Meeting:** Acknowledged the timeline challenges. Stated that it's the VFPA's intention is to share the effects assessment, and incorporate Musqueam's comments into the document submitted. **30-Sep-2016, Letter from the VFPA:** Responded that comments have been included and incorporated in the AIMSA, and will also be submitted directly to the Review Panel and posted on the public registry. Enclosed AIMSA Appendix 2-B showing the issues raised by Musqueam First Nation and the VFPA's responses.	**Addressed in AIMSA – MFN and TWN, Appendix 2-B (#3):** The VFPA acknowledges the challenges associated with preparing additional information for the marine shipping effects assessment, and has extended timelines, in line with Musqueam's request, for opportunities to provide information or comments. The VFPA provided the Musqueam with the funding amount requested.	**AIMSA – MFN and TWN** Appendix 2-B Aboriginal Issues and Interests
MFN-7.15	Stated that Musqueam should be consulted on the high level not moderate level. Stated that the consultation approach sent to Musqueam must be revisited. Referenced case law along with Sparrow and stated that no other First Nation	11-Feb-2014, Letter to the CEA Agency (CEAR Document #155)	**05-Dec-2014, Letter from the VFPA:** Thanked Musqueam for meeting with the VFPA on 19-No-2014. Stated that the VFPA is writing to provide further responses to some of the requests you have made and the questions or concerns you have raised.	**Addressed in EIS Section 7.2:** The CEA Agency identified the Indigenous groups that may potentially be affected by the Project and listed them in the *EIS Guidelines*. The CEA Agency also determined the depth of the duty to consult with each Indigenous group, and Musqueam was consulted as part of this process. The CEA Agency identified Musqueam as requiring a "high" depth of consultation. As	**EIS** 7.0 Engagement and Consultation 7.2 Aboriginal Engagement and Consultation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	should be assessed high other than Tsawwassen First Nation.	19-Nov-2014, Health & Aboriginal Rights Workshop - MFN	[The VFPA] fully acknowledges and respects the critically important decision of the Supreme Court of Canada in Sparrow. We have read and absorbed the findings of the Court. We recognise the importance of this decision to Musqueam and we further recognise the importance placed by Musqueam on its fishing rights. [The VFPA] is also aware of and respects the many and various court decisions that have subsequently applied and expanded on the seminal decision in Sparrow. [The VFPA] wishes to meaningfully engage with Musqueam in order to fully understand Musqueam's perspective and views regarding (i) its Aboriginal rights, including title, (ii) potential impacts on those rights arising from the Project and (iii) potential means by which such adverse effects may be avoided, mitigated, or otherwise accommodated. In doing so, we are cognizant and respectful of the findings of the Supreme Court in the Sparrow decision. At the same time, [the VFPA] does not believe that engaging in extensive legal debate is conducive to a productive engagement process and/or healthy relationship-building. [The VFPA] does not control or dictate the requirements of the CEA Agency's process. To the contrary, [the VFPA] is subject to the regulatory requirements imposed on it by the CEA Agency and other regulators. However, [the VFPA] views the regulatory standards imposed on it as only the minimum requirements which must be met. There is no restriction on [the VFPA] and Musqueam agreeing to go above and beyond the minimum regulatory requirements. This is another reason that we would like to move beyond the legal debate and instead focus on a more substantive and concrete discussion around the Project, its potential impacts, and potential means to avoid, mitigate, or otherwise accommodate any potential impacts. We hope that you share our objective in this regard.	described in EIS Section 7.2 and EIS Appendix 7.2-A, the VFPA has consulted with Musqueam in the same fashion as Tsawwassen First Nation, which was also identified by the CEA Agency as requiring high consultation.	7.2.1.2 Identification of Aboriginal Groups Appendix 7.2-A Consultation Activities by Aboriginal Group

			and the "Review Panel and Aboriginal Consultation Process Diagrams Handout" http://www.ceaaacee.gc.ca/050/documents/p80054/1 00179E.pdf. Please see the letter the Agency sent to the Musqueam on January 23, 2015, for the Crown's view on justification in the context of the EA process.		
MFN-8.5	Requested that "knowledge of Aboriginal and treaty rights regarding section 35 of the constitution and subsequent case law" be added to section 4.1 of the TOR.	19-Sep-2014, Letter to the CEA Agency (CEAR Document #129)	**24-Apr-2015, Letter from the CEA Agency:** "Musqueam are welcome to submit potential panel candidates to the Agency. Panel Members must be unbiased and free from conflict of interest relative to the Project, and have knowledge or experience relevant to its potential environmental effects. Please provide suggested names and CVs to Debra Myles or contact Candace Anderson for further information.	**Additional information provided by the VFPA:** The VFPA has reviewed this letter and understands it to be directed to the CEA Agency. The VFPA has no further information to provide.	
MFN-8.6	Requested that "and determine if the proponent has completed due diligence regarding section 35" be added to the TOR.	19-Sep-2014, Letter to the CEA Agency (CEAR Document #129)	**24-Apr-2015, Letter from the CEA Agency:** "The purpose of the Agency's completeness review is not to determine if the proponent has completed the requirements for consultation at this point in the process. The completeness review is to confirm that the information identified in the Environmental Impact Statement (EIS) guidelines (available here: http://www.ceaa-acee.qc.ca/050/documents/p80054/97463E.pdf) has been provided by the Proponent in the EIS. The EIS Guidelines require the proponent to include information related to potential impacts on Aboriginal rights. The Agency will make the EIS available for a review and comment period.	**Additional information provided by the VFPA:** The VFPA has reviewed this letter and understands it to be directed to the CEA Agency. The VFPA has no further information to provide.	
MFN-8.7	Requested that section 4.0 of the TOR include adequate time to review and comment on the EIS.	19-Sep-2014, Letter to the CEA Agency (CEAR Document #129)	**24-Apr-2015, Letter from the CEA Agency:** "The Review Panel will conduct the EIS sufficiency review, which will include a comment period, following its appointment.	**Additional information provided by the VFPA:** The VFPA has reviewed this letter and understands it to be directed to the CEA Agency. The VFPA has no further information to provide.	
MFN-8.8	Requested that section 4.12 be added to include "and if indicated or requested conduct a First Nations hearing." Stated that the review panel will allow additional time for First Nations to respond to the EIS where necessary.	19-Sep-2014, Letter to the CEA Agency (CEAR Document #129)	**24-Apr-2015, Letter from the CEA Agency:** "The Review Panel will determine and issues its procedures for the sufficiency review and the public hearing. The Review Panel shall, where practicable, hold the public hearing sessions in the area(s) closest to the Project, including Aboriginal communities, to provide convenient access for potentially affected Aboriginal groups and local communities. The timeframes set out for comment periods by the Review Panel are at their discretion. The Review Panel must provide a fair and equitable process for all parties.	**Additional information provided by the VFPA:** The VFPA has reviewed this letter and understands it to be directed to the CEA Agency. The VFPA has no further information to provide.	
MFN-8.9	Requested that section 4.19 also include "including section 35 consultation requirements regarding First Nations rights."	19-Sep-2014, Letter to the CEA Agency (CEAR Document #129)	**24-Apr-2015, Letter from the CEA Agency:** "The Review Panel may request the services of independent non-government experts to provide advice on any issue within its Terms of Reference, including issues that relate to Aboriginal rights."	**Additional information provided by the VFPA:** The VFPA has reviewed this letter and understands it to be directed to the CEA Agency. The VFPA has no further information to provide.	
MFN-8.10	Requested that section 4.21 also include "if requested and	19-Sep-2014, Letter to the	**24-Apr-2015, Letter from the CEA Agency:**	**Additional information provided by the VFPA:**	

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	where necessary a First Nation can submit information."	CEA Agency (CEAR Document #129)	"The Review Panel is expected to conduct the environmental assessment in a fair manner. The Review Panel may provide an opportunity for all participants to review and comment on the information that is requested by the Review Panel or is otherwise submitted."	The VFPA has reviewed this letter and understands it to be directed to the CEA Agency. The VFPA has no further information to provide.	
MFN-8.11	Requested that section 4.22 and 4.23 also include "public and First Nations hearings."	19-Sep-2014, Letter to the CEA Agency (CEAR Document #129)	**24-Apr-2015, Letter from the CEA Agency:** "The Review Panel will determine and issue its procedures for the sufficiency review and the public hearing. The Review Panel shall, where practicable, hold the public hearing sessions in the area(s) closest to the Project, including Aboriginal communities, to provide convenient access for potentially affected Aboriginal groups and local communities."	**Additional information provided by the VFPA:** The VFPA has reviewed this letter and understands it to be directed to the CEA Agency. The VFPA has no further information to provide.	
MFN-8.12	Stated that the Proponent should refer and consult the updated guidance on the use of Aboriginal Traditional Knowledge in *CEAA 2012.* Stated that the Proponent refers to the 2013 archived version. Proponent should refer and consult the updated guidance on assessing physical and cultural heritage or on any structure, site or thing that is of historical, archaeological, paleontological or architectural significance. In the EIS, the Proponent refers to the 2014- archived version. Requested details on Proponent's use of the consultation to the following documents: 1. "Reference Guide Considering Aboriginal Traditional Knowledge in Environmental Assessments Conducted under the *Canadian Environmental Assessment Act, 2012*" (March 2015) 2. Technical Guidance for Assessing Physical and Cultural Heritage or any Structure, Site or Thing that is of Historical, Archaeological, Paleontological or Architectural Significance under the *Canadian*	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency did not request additional information for this item as it is more appropriately considered through the Panel's sufficiency review. However, the Agency did provide some additional direction to VFPA in its cover letter to IRs on July 31, 2015. The following wording is found on page 2: "As the process proceeds, Port Metro Vancouver [the VFPA] is required to consult updated or new policy and guidance from the Agency and federal or other authorities on topics to be addressed, and to apply these directives, as appropriate, into the environmental assessment. For example, the following Agency guidance documents were updated in March 2015: • Operational Policy Statement - Assessing Cumulative Environmental Effects under the Canadian Environmental Assessment Act, 2012 • Operational Policy Statement - Addressing "Purpose of" and "Alternative Means" under the *Canadian Environmental Assessment Act, 2012* • Technical Guidance for Assessing Physical and Cultural Heritage or any Structure, Site or Thing that is of Historical, Archaeological, Paleontological or Architectural Significance under the *Canadian Environmental Assessment Act, 2012* • Reference Guide Considering Aboriginal Traditional Knowledge in Environmental Assessments Conducted under the *Canadian Environmental Assessment Act, 2012*."	**Additional information provided by the VFPA:** The VFPA has reviewed this letter and understands it to be directed to the CEA Agency. The VFPA has no further information to provide.	

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Environmental Assessment Act, 2012 (March 2015)				
MFN-8.13	Stated that in section 6.2 of EIS, another section should be added 'other regulatory considerations' that refers to R. vs Sparrow (1990) as well as related fishery agreements between Musqueam and DFO. (e.g., Comprehensive Fisheries Agreement between DFO and Musqueam First Nation).	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency did not request additional information for this item as it is more appropriately considered through the Panel's sufficiency review. The Crown is open to hearing about potential impacts to all potential or established rights from Musqueam including any opportunities to minimize or avoid any potential impacts from the proposed project. Musqueam is encouraged to ensure the Panel is aware of your concerns in this regard."		
MFN-8.14	Requested that the Panel now take concrete steps to issue the information requests and direct the Proponent to provide the missing information and analysis referenced in this submission.	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following information.	**Additional information provided by the VFPA:** The independent review panel for the Project began issuing information requests to the VFPA on September 28, 2016 with the issuances of Information Request Package 1 (CEAR Document #557). As of August 1, 2018, the VFPA has received 13 information request packages from the Review Panel which total 349 individual information requests. These information requests seek additional information or clarification on information presented in the EIS and MSA.	
MFN-8.15	Recommended that the Panel build upon the Crown's August 31, 2016 requests for additional information that…represent a step beyond what the Proponent to date has been willing to undertake in terms of an appropriate assessment of Project interactions with, and Project-specific and cumulative effects on, Musqueam's rights-based practices.	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA understands that this comment is directed to the Panel.		
MFN-8.16	Urged the Panel to require that this supplemental information and analysis be filed by the Proponent prior to finding the EIS sufficient to initiate the panel hearing phase of this EA.	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA understands that this comment is directed to the Panel.		
MFN-8.17	Asked for updates on the review process and timelines for the Project.	12-Jun-2017, Roberts Bank Boat Tour #1	**12-Jun-2017, Boat Tour:** Responded with an update on the IR process, upcoming IR packages that are expected and the expectation of a public comment period before the panel hearings.	**Additional information provided by the VFPA:** Additional information concerning the environmental review of the project, including timelines and public comment periods, are updated on the CEA Agency-maintained project Registry: http://www.ceaa-acee.gc.ca/050/evaluations/proj/80054.	

Table 9: Environmental Management Program

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-9.1	Interested in the effectiveness of the Deltaport Third Berth project (DP3) mitigations, and information generated as part of the adaptive management strategy. Asked whether caisson fish refugia was used for DP3 and if so, whether it was effective.	30-Sep-2013, Meeting with Administrative Staff 07-Oct-2014, Preliminary EIS Results Workshop #1	**30-Sep-2013, Meeting:** Recorded comment for consideration by the Project team. **18-Oct-2013, Meeting with Musqueam:** Provided Musqueam with the Adaptive Management Strategy annual reports for DP3 on a USB stick. **07-Oct-2014, Workshop:** Responded that fish refugia were created for DP3 and in the caisson structures of some of the inner harbour terminals as well. Explained that as potential mitigation measures are identified for RBT2, the VFPA will have to determine their efficacy. It was noted that fish refugia has been used before, and is particularly good for some species, and less so for others. Past projects have used adaptive management and monitoring programs to determine efficacy. At this point, fish refugia is one of a few preliminary concepts, and as the Project moves forward the VFPA will consider which ones best meet the offsetting requirements of the Project. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. **17-Jul-2017, Meeting:** The VFPA met with Musqueam First Nation to discuss the proposed Follow-up Program for RBT2 and lessons learned from DP3.	**Additional information provided by the VFPA:** Caisson refugia were installed at Deltaport to improve habitat complexity and enhance fish migration and feeding behaviour. Post construction monitoring is being conducted and results are reported in the Adaptive Management Annual Reports. **Addressed in EIS Appendix 7.2-B (#32):** Onsite habitat selection considered lessons learned from previous habitat creation programs (e.g., DP3). The effectiveness monitoring reports for DP3 increased the understanding of the successes and challenges of previous habitat projects. The VFPA publishes annual reports on the Adaptive Management Strategy for DP3, which are available on VFPA's website: https://www.portvancouver.com/development-and-permits/status-of-applications/deltaport-third-berth-project/. An adaptive management approach will be taken as indicated in EIS Section 33.5 RBT2 Follow-up Program. **Addressed in IR10-11:** The VFPA's response to Information Requirements #IR10-11 as requested by the Review Panel describes how Indigenous groups will be involved in the development, implementation and management of the RBT2 follow-up program.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table **Information Requests** Response to Sufficiency Information Request #11 (IR10-11)
MFN-9.2	Requested a detailed description of contractor contingency plans to address accidents and malfunctions. Requested a rationale for why Aboriginal groups are excluded from consultation in all but two of the proposed Construction Environmental Management Plan sub-plans, or reconsider. Stated that Musqueam expects that Section 33 of the final EIS will include more detail on proposed Construction Environmental Management Plans.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review. However, the Agency notes, in its cover letter to Port Metro Vancouver [the VFPA] on July 31, 2015, that the "assessment of the potential environmental effects of the Project and the measures to mitigate those adverse effects will develop as the environmental assessment proceeds." As such, Musqueam is encouraged to express these concerns to the panel during its sufficiency review for further discussion."	**Addressed in EIS Section 33.2:** To ensure their alignment with all required Project permits, any conditions of approvals, final designs, finalised construction or operation approaches, and site-specific considerations, the Project's EMPs are necessarily developed and finalised nearer to the start of the construction and operation phases. Feedback on applicable Environmental Management Plan sub-plans will be solicited from Indigenous groups potentially affected by the Project. **Addressed in Response to IR10-12:** The VFPA's response to IR10-12, as requested by the Review Panel, further discusses how potential environmental effects during construction and operation on current use, cultural heritage, health and safety of Indigenous peoples are addressed.	**EIS** 33.2 Environmental Management Plans **Information Requests** Response to Sufficiency Information Request #12 (IR10-12)
MFN-9.3	Stated that more details on a Proponent-proposed follow-up plan ("the RBT2	15-Jun-2015, Letter to the CEA Agency (CEAR	**15-Oct-2015, Letter from the CEA Agency:** "The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will	**Addressed in EIS Section 33.5:** Similar to the Adaptive Management Strategy for DP3, as described in EIS Section 33.5, the VFPA is committed to developing and implementing a	**EIS** 33.5 Follow-Up Program **Information Requests**

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Follow-up Program document") is required. Stated that the current document provided in place of a Follow-up Program is a very preliminary, high-level document, "Proposed Draft Follow-up Program Elements" that falls short of a clearly detailed follow-up plan or program document. Stated that this document must include the role of Musqueam in development and implementation of follow-up measures. Interested in the Adaptive Management Program proposed for RBT2 and its methodology.	Document #241) 16-Jun-2017, Meeting with Administrative Staff	determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review. However, the Agency did provide some additional direction to VFPA in its cover letter to on July 31, 2015. The following wording is found on page 3: "A follow-up program is designed to verify the accuracy of the effects assessment and to determine the effectiveness of the measures implemented to mitigate the adverse effects of the project. The assessment of the potential environmental effects of the Project and the measures to mitigate those adverse effects will develop as the environmental assessment proceeds. Port Metro Vancouver [The VFPA] is advised to apply the applicable requirements of section 11.4 of the EIS Guidelines to each adverse environmental effect prediction to verify its accuracy and evaluate each mitigation measure to determine its effectiveness. These components of the follow-up program are then to be carried forward as commitments of the proponent." **16-Jun-2017, Meeting:** Recorded comment for consideration by the Project team. **17-Jul-2017, Meeting:** The VFPA met with Musqueam First Nation to discuss the Follow-up Program. The Program includes an Adaptive Management Strategy. The VFPA is seeking input from Musqueam First Nation on the Follow-up Program.	Follow-up Program for the Project. The purpose of the Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project. To ensure the Program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the EIS. The Follow-Up Program will include: • An evaluation of the adequacy of existing data to provide a benchmark against which to test Project-related effects; • A monitoring design drawing on the measurable parameters identified to be field-tested; • A methodological approach for using field-collected data to measure and verify the accuracy of the effects predicted in the EIS; • A reporting framework that defines frequency of reporting, distribution and feedback mechanisms; and • Details of the VFPA's approach to adaptive management for the Project through construction and operation. The Follow-Up Program will be developed in consultation with federal agencies, including the CEA Agency, DFO, and Environment Canada. Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on the program and approving agencies have an opportunity to evaluate and approve the Program. Feedback from Indigenous groups regarding the draft Program will be sought through the VFPA's ongoing engagement initiatives. **Addressed in IR10-11:** The VFPA's response to Information Requirements #IR10-11 as requested by the Review Panel describes how Indigenous groups will be involved in the development, implementation and management of the RBT2 follow-up program.	Response to Sufficiency Information Request #11 (IR10-11)
MFN-9.4	Requested a clear description of other technically and economical feasible mitigation measures and why they were rejected.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency has requested additional information regarding mitigation measures in its letter of July 31, 2015 to Port Metro Vancouver [the VFPA] (page 6, #12)."	**Addressed in Response to IR-7.31.15-12:** Provides a discussion of mitigation measures considered by the VFPA, including those considered and rejected.	**Information Requests** Response to Information Request #12 (IR-7.31.15-12 of CEAR Document #314)
MFN-9.5	Stated that the two forms of mitigation proposed in the MSA have been left undefined as little more than a plan to consult on developing a plan: • "Consultation on the development of a potential marine shipping activities communication plan"	23-May-2016, Letter 15-Sep-2016, Email	**07-Jul-2016, Letter from the VFPA:** With respect to the Musqueam conclusions noted in the Implications of MMSEA to the MSA to the EIS (MSA) section of your letter, we welcome further discussion with respect to your concerns related to the understanding of current context of CULRTP, and the evaluation of efficacy of proposed mitigations. We would be happy to discuss Musqueam's perspectives and ideas in relation to the marine shipping activities communication plan and measures that would be aimed at reducing the impact of the international shipping lanes to fishing by Indigenous groups. We value Musqueam's input and are of the view	**Addressed in Response to IR-7.31.15-12:** Explains how the mitigation measures proposed in the EIS are meant to reduce significance, and discusses the anticipated effectiveness of the proposed mitigation measures. As noted in that response, combined with other mitigation measures proposed for the potential effect, this mitigation is anticipated to be effective.	**AIMSA – MFN and TWN** 7.0 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights 7.4 Suggested Mitigation Measures **Information Requests** Response to Information Request #12 (IR-7.31.15-

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	• "Consultation with the affected Aboriginal groups to identify measures that would reduce the impact of the international shipping lanes to fishing by Aboriginal groups" Stated that a "plan to consult to make a plan" is not proper mitigation as the potential efficacy of such undefined measures are impossible to determine. Stated that Musqueam avoidance of large vessel traffic areas, and/or evasive manoeuvres to avoid collisions with large vessels or associated wake from large vessels is not just a form of mitigation to avoid accidents and collisions, but also a residual adverse effect of diminishment of harvesting opportunities. Disagreed with characterization of yet-to-be-defined mitigation as highly effective for addressing stated residual effects, i.e. Stated that the proposed mitigation of 'safety communications' cannot constitute a form of effective mitigation against the diminishment of opportunity on the behalf of Musqueam fishers to exercise their right to fish as a result of increased shipping traffic in harvesting areas.		that by working together in the development of mitigation measures, the process and the mitigation itself is enhanced. **30-Sep-2016, Letter from the VFPA:** Responded that comments have been included and incorporated in the AIMSA, and will also be submitted directly to the Review Panel and posted on the public registry. Enclosed an excerpt from the AIMSA (Appendix 2-B Aboriginal Issues and Interests) showing your September 15, 2016 comments on the final draft AIMSA and the VFPA's response to those comments. "The VFPA is confident in the effectiveness of the suggested mitigation measures described in the AIMSA, but has noted Musqueam's views on these suggested measures in Section 7.4. These measures are the same as those described in the MSA. By way of this comment, the VFPA notifies the CEA Agency and the Review Panel of Musqueam First Nation's views on the suggested mitigation measures."		12 of CEAR Document #314)
MFN-9.6	Stated inappropriate use of "future discussions" as full successful mitigation for adverse displacement	23-May-2016, Letter & Musqueam Marine	**23-Nov-2016:** Recorded comment for consideration by the Project team.	**Addressed in Response to IR-7.31.15-12:** Explains how the mitigation measures proposed in the EIS are meant to reduce significance, and discusses the anticipated effectiveness of the proposed mitigation measures. As noted in that response, combined with	**Information Requests** Response to Information Request #12 (IR-7.31.15-

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	effects of the Project on Musqueam Current Use of Lands and Resources for Traditional Purposes (i.e., crab harvesting): • Using a methodologically unsound practice, the Proponent has treated its own yet-to-be determined or defined proposal for "future discussions" related to accommodation/compensation measures, as a form of mitigation that the Proponent suggests would, sight unseen, offset all adverse residual effects on Musqueam CULRTP (and related rights-based practices. This is an unacceptable approach to both the conduct of an EA and the assessment of adverse impacts of the Project on Musqueam rights and title, and therefore constitutes a serious gap in the EIS.	Shipping Effects Assessment 03-Nov-2016, Letter to Panel (CEAR Document #776)		other mitigation measures proposed for the potential effect, this mitigation is anticipated to be effective.	12 of CEAR Document #314)
MFN-9.7	Suggested a smartphone app be developed to allow activities, such as hauling the traps, to take place when the area is not being used by ships at the Terminal and would not cause a navigation hazard; noted could also be used to police and monitor the activities going on to reduce violations currently happening. Suggested a light-notification system at the top of the Terminal	23-Feb-2017, Meeting with Community Members / Commercial Crabber and MFN Staff re: crabbing	**23-Feb-2017, Meeting:** Recorded comment for consideration by the Project team. **12-Apr-2018, Letter from the VFPA:** Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the RBT2 Crab Mitigation Summary Overview, which detailed the following: • Mitigation measures to avoid or reduce effects to crab as outlined in the EIS; and • Additional crab harvesting related mitigation measure suggestions under review.	**Additional information provided by the VFPA:** Beyond the mitigation measures suggested in the EIS and MSA, the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area. **Addressed in Response to IR7-34:** As noted in the VFPA's response to IR7-34, mitigation measures currently undergoing consultation and evaluation include: • Crab Management Area re-selection opportunity; • Adjustment of proposed navigational closure area expansion with consideration of commercial harvesting during Project operation; • Adjustment of the proposed navigational closure area expansion with consideration of Indigenous harvesting during operation; • Navigational Limited Access Fishing Area (multi-user system during operation); and • Financial compensation.	**Information Requests** Response to Sufficiency Information Request #34 (IR7-34 of CEAR Document #1172)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	similar to the new ferry terminal at Baines Sound on Denman Island as a way of signally when a ship is at the Terminal.		Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.	The evaluation of additional mitigation measures is being informed by consultation with commercial crab harvesters (including the Area I Crab Fisherman Association), Indigenous groups, DFO, and may include other relevant regulatory agencies regarding their specific interests and concerns. Evaluation of technical and economic feasibility of the suggested measures is currently underway to inform this consultation. Technical feasibility considers the following: • Availability, applicability, and effectiveness of the specific technology; • Fit with local site characteristics, Project design, construction schedule; • Applicable regulatory frameworks; and • Whether implementation is within the VFPA's jurisdiction. Economic feasibility considers the following: • Scope of the Project design (Project re-design not required); • Construction schedule (Project construction delay not required); and • Total cost of implementation of each measure during construction and/or operation.	
MFN-9.8	Requested that the following be documented collaboratively with the Indigenous Group: a. any mitigation or accommodation measures identified by Musqueam to address any potential impacts to the exercise of rights identified by Musqueam; b. Musqueam views on the potential effectiveness of a marine shipping communications plan to address Musqueam's concerns relating to its members' navigation in and through shipping lanes for fishing and access to use sites c. Musqueam views on the economic effects of any potential impacts to the Musqueam's exercise of rights.	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 7.0:** The VFPA has engaged with the Indigenous groups listed in the *Updated EIS Guidelines* to obtain their views with respect to the Project, potential effects associated with the Project, and measures to mitigate potential effects associated with the Project. Consultation and engagement activities are described in EIS Section 7.0. **Addressed in Response to IR7-31:** The VFPA's forthcoming response to IR7-31, as requested by the Review Panel, provides a summary of the views of Indigenous groups in relation to the proposed mitigation measures that were considered in the preparation of the EIS for each biophysical valued component, including views about offsetting.	**EIS** 7.0 Engagement and Consultation **Information Requests** Response to Sufficiency Information Request #31 (IR7-31)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-9.9	Requested Report on Effectiveness of Existing Mitigations: The Proponent must submit a supplementary document that collates and presents an analysis of the most recent monitoring data regarding the effectiveness of existing mitigation measures to address adverse effects of previous phases of the Roberts Bank/Delta Port terminal complex. Requested the annual and final reports for the DP3 AMS program.	03-Nov-2016, Letter to Panel (CEAR Document #776) 17-Jul-2017, Follow-up Program Workshop – MFN	The VFPA has reviewed this letter and provides the following additional information. **18-Oct-2013, Meeting:** Provided Musqueam with the Adaptive Management Strategy annual reports for DP3 on a USB stick. **17-Jul-2017, Meeting:** The VFPA met with Musqueam First Nation to discuss the proposed Follow-up Program for RBT2 and lessons learned from DP3. **18-Jul-2017, Letter from the VFPA:** The VFPA sent a USB to Musqueam containing electronic versions of DP3 AMS Annual Reports, SAC Responses to DP3 AMS Annual Reports, and DP3 AMS Final Report.	**Addressed in Response to IR-7.31.15-12:** Explains how the mitigation measures proposed in the EIS are meant to reduce significance, and discusses the anticipated effectiveness of the proposed mitigation measures. The VFPA has published annual monitoring reports on the Adaptive Management Strategy for DP3, which are available on VFPA's website: http://www.portvancouver.com/development-and-permits/status-of-applications/deltaport-third-berth-project/. **Addressed in Response to IR10-11:** The VFPA's response to IR10-11, as requested by the Review Panel, discusses the effectiveness of the DP3 AMS and how lessons learned from the experience may inform the RBT2 Follow-Up Program.	**Information Requests** Response to Information Request #12 (IR-7.31.15-12 of CEAR Document #314) Response to Sufficiency Information Request #11 (IR10-11)
MFN-9.10	Concerned that ongoing or follow-up monitoring would be undertaken by VFPA, evaluating its own project which would be a conflict. Requested third party involvement so it would be unbiased.	17-Jul-2017, Follow-up Program Workshop – MFN	**17-Jul-2017, Workshop:** Responded that DP3 provides a good example; an independent Scientific Advisory Committee (SAC) was established, over which the VFPA had no influence. Its purpose was to determine if the Adaptive Management Strategy (AMS) met the requirements of its terms of reference. Responded that Dr. Sutherland was one of the SAC members and undertook to follow-up with the names of the other members. Responded that members of the SAC were selected by DFO and government.	**Additional information provided by the VFPA:** A Scientific Advisory Committee (SAC) was established by the VFPA and Environment Canada in the spring of 2007 as a means to provide independent scientific and technical advice to the VFPA, and upon request to Environmental Canada, in relation to the implementation of the Adaptive Management Strategy (AMS). The SAC met several times per year to review quarterly reports, discuss annual reports with consultants, and carry out field excursions to observe the ecosystem first-hand. The SAC reviewed the monitoring data presented in the annual reports to determine if any emerging trends were taking place in the inter-causeway ecosystem in relation to DP3 construction. On occasion, a member of SAC met with various public bodies interested in the development of DP3. Part of SAC's mandate was to help steer the 'adaptive' part of the AMS process. Modifications to the AMS along with corresponding rationales were provided in the annual reports. (source: https://www.portvancouver.com/wp-content/uploads/2015/10/Final-SAC-letter-2014-Annual-Report-Nov-3.pdf) **Addressed in Response to IR10-11:** The VFPA's response to IR10-11, as requested by the Review Panel, describes how Indigenous groups will be involved in the development, implementation and management of the RBT2 follow-up program.	**Information Requests** Response to Sufficiency Information Request #11 (IR10-11)

Table 10: Human Health – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-10.1	Stated that adverse health outcomes due to changes in food security and food sources is of significant concern, which is not reflected by the determination of significance in the presentation.	19-Nov-2014, Health & Aboriginal Rights Workshop - MFN	**19-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in EIS Appendix 7.2-B (#127):** An assessment was conducted to determine potential Project-related effects on human health. The assessment was carried out using both a quantitative human health risk assessment and a qualitative health impact assessment and considered: • Exposure to air emissions; • Exposure to noise and vibration; • Exposure to shellfish contamination; • Stress and annoyance; • Employment and income; • Food security, including potential changes in availability of traditional food; and • Health inequity, referring to the distribution of Project-related risks and benefits. The sub-component of health inequity assessed potential effects related to unequal distribution of Project-related benefits and Project-related adverse effects. The sub-components of stress and annoyance and employment and income assessed factors related to mental wellbeing. The rationale for selection of VC subcomponents and indicators is provided in the EIS. The human health assessment concludes that: • The Project is not expected to result in any significant adverse effects on human health. Incremental adverse cumulative effects to human health are expected to be negligible. • Potential Project-related effects on human health are expected to be fully or partially mitigated through the implementation of environmental management plans and additional mitigation measures. • The Project would result in measurable residual effects for exposure to air emissions during construction and exposure to noise during construction and operation. • Mitigation is expected to reduce all other residual effects to a negligible (i.e., not measurable) level. **Addressed in IR13-14:** The VFPA's forthcoming response to IR13-14 will further discuss the assessment of food security.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table **Information Requests** Response to Sufficiency Information Request #14 (IR13-14)
MFN-10.2	Concerned that employment opportunities do not equate to an improved effect from the Project because the subsistence ability (to fish, to gather) is reduced.	19-Nov-2014, Health & Aboriginal Rights Workshop - MFN	**19-Nov-2014, Workshop:** Stated that there will be employment opportunities created as part of the Project and some people will directly benefit from the creation of jobs. There will also be those people that live close to the Project area that may experience adverse effects (i.e., noise). In the EIS, it is predicted that there will be a small increase in health inequity. Several studies have shown a relationship between income, employment and health. People who have good jobs, higher income, and work under better conditions are likely to experience improved health outcomes. People with low income or with no job or who have very unsafe jobs typically experience poorer health outcomes. Any additional information you could provide with regard to cultural context would be appreciated.	**Addressed in EIS Appendix 7.2-B (#130):** As discussed throughout EIS Section 27.0, the Project is expected to result in both positive effects (such as economic benefits) and adverse health effects (such as potential effects on cultural activities such as subsistence food harvesting), and the distribution of these effects may vary across population groups. This raises the concept of health inequity: the extent to which the distribution of positive and adverse health effects is fair and equitable. Concerns related to health inequity are addressed in the human health effects assessment; however, the assessment of potential effects on health inequity does not rank the relative importance of the various determinants of health (e.g., purchasing power and cultural activities). Cultural aspects related to subsistence gathering are considered in EIS Section 32.2 Current Use of Land and Resources for Traditional Purposes.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 27.0 Human Health 27.6.5 Potential Effect #4 – Adverse Health Outcomes due to Changes in Health Inequity 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			01-Apr-2015, Letter from the VFPA: Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in IR13-15:** The VFPA's forthcoming response to IR13-15 will further discuss the assessment of health inequity within the human health assessment.	32.2 Current Use of Land and Resources for Traditional Purposes **Information Requests** Response to Sufficiency Information Request #15 (IR13-15)
MFN-10.3	Requested a health effects assessment in a disaggregated fashion, separating out effects on Aboriginal and non- Aboriginal sub-populations and considering effects on each affected First Nation.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency has requested that Port Metro Vancouver [the VFPA] provide an "assessment of effects of the Project on human health in a manner that differentiates between Aboriginal and non-Aboriginal people" in its letter of July 31, 2015 to Port Metro Vancouver [the VFPA] (page 13, #28)."	**Addressed in EIS Sections 27.0 and 32.2:** EIS Sections 27.0 and 32.2 address potential effects of the Project related to human health. Within the human health section, information is presented separately for both Indigenous and non-Indigenous populations, for both existing conditions and for effects of the Project on human health, except where those distinctions are not practical. Within the Current Use section, all information is pertaining to Indigenous populations. **Addressed in Response to IR-7.31.15-28:** Provides further summary information in Table IR28-1 Summary of Health Effects Assessment for Indigenous and non-Indigenous people and summarises how the relevant EIS sections address differential conditions and effects between the Indigenous and non-Indigenous populations, and provides a rationale for why aspects may be presented together for those instances in which a distinction is not made.	**EIS** 27.0 Human Health 32.2 Current Use of Lands and Resources for Traditional Purposes **Information Requests** Response to Information Request #28 (IR-7.31.15-28 of CEAR Document #314)
MFN-10.4	Concerned over the human health consequences of consuming seafood from the Fraser River and the Salish Sea as levels of pollution have mounted.	15-Nov-2017, Letter to Panel (CEAR Document #1098)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 27.0:** Human health risks associated with the gathering and consumption of edible shellfish from the Roberts Bank area were formally evaluated using a quantitative HHRA approach. Overall, it is concluded that there is negligible potential for human health effects from the construction or operation of RBT2 based on toxicological risks associated with marine shellfish consumption.	**EIS** 27.0 Human Health Appendix 27-C Shellfish Harvesting Potential and Contaminant-Related Consumption Risks at Roberts Bank

Table 11: Marine Commercial Use – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-11.1	Stated that habitat changes could reduce ability to harvest aquatic resources.	15-Oct-2013, Letter to the CEA Agency (CEAR Document #41)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 32.0:** Considers the results of effects assessments of potential Project and cumulative effects on marine vegetation, marine invertebrates, marine fish, marine mammals, coastal birds, marine commercial use, outdoor recreation, visual resources, land and water use, human health and archaeology and heritage resources, the ongoing productivity of commercial, recreational and Indigenous fisheries, as well the assessment of potential changes to air quality, noise and vibration, light and the assessment of potential accidents or malfunctions. The current use effects assessment considered potential effects on: • Access to preferred current use locations; • Availability of preferred current use resources; • Quality of preferred current use resources; and • Quality of current use experience Following implementation of the mitigation summarised in the EIS Section 32.2.7, adverse residual Project-related effects are expected to be negligible. Therefore, the Project is not expected to contribute to cumulative effects.	**EIS** 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2.7 Mitigation Measures
MFN-11.2	Requested information regarding restricted fishing areas within the Deltaport area.	06-Aug-2014, Meeting	**06-Aug-2014, Email from the VFPA:** The VFPA provided a map, "Roberts Bank Navigational Closure." This map showed the navigation closure area where no commercial crab fishing is permitted. **22-Aug-2014, Meeting:** The VFPA also met with Musqueam staff and a Musqueam crabber on 22-Aug-2014 and provided a map showing the current navigational closure for commercial crab harvesting, the current navigational closure for recreational crab harvesting, and the proposed navigational closure expansion for crab harvesting during construction and operation.	**Additional information provided by the VFPA:** EIS Section 21.0 discusses commercial seafood harvesting in the Project area. Figure 21-6 Commercial Crab Harvesting Activity Areas and Navigational Closure Area and Figure 21-8 Proposed Navigational Closure Expansion.	**EIS** 21.0 Marine Commercial Use Figure 21-6 Commercial Crab Harvesting Activity Areas and Navigational Closure Area Figure 21-8 Proposed Navigational Closure Expansion
MFN-11.3	Asked how a residual effect can be determined not to be significant when the Project will displace 19 licensed crab harvesters.	29-Oct-2014, Preliminary EIS Results Workshop #4	**29-Oct-2014, Workshop:** Responded that there are 19 licence holders in that particular area that could be displaced. Stated that if there is a need to relocate just outside of a closed area, it will be a relatively small amount of licence holders that would have to be relocated to another harvesting area. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. **12-Apr-2018, Letter from the VFPA:** Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders.	**Addressed in EIS Appendix 7.2-B (#120):** In the Marine Commercial Use assessment, a residual effect is considered significant when all of the following conditions are met: • The effect occurs to a known area of commercial marine-based activity or potential; • The effect displaces or excludes commercial marine-based activities from a known use area; • There are associated adverse harvest or revenue effects due to the displacement; and • The displaced commercial marine-based activity cannot move to known alternative activity areas due to regulatory reasons. The Project is expected to result in a residual effect of changes to seafood harvesting area, harvest and revenue. This residual effect (related to the displaced crab harvesters) is determined to be not significant, however, as Dungeness crab are known to move substantial distances to baited traps, and harvest activity can be moved to another open area. The potential for an adverse effect related to changes in access to preferred Current Use locations for crab is discussed in EIS Section 32.2.6. With the implementation of mitigation measures (EIS Section 32.2.7), residual Project-related effects on Current	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 12.0 Marine Invertebrates 21.0 Marine Commercial Use 21.7 Future Conditions with the Project – Potential Project-related Effects 21.10 Determination of Significance of Residual Adverse Effects Table 21-10 Summary of Determination of Significance of Residual Effects for Marine Commercial Use 24.0 Outdoor Recreation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			Provided the RBT2 Crab Mitigation Summary Overview, which detailed the following: • Mitigation measures to avoid or reduce effects to crab as outlined in the EIS; and • Additional crab harvesting related mitigation measure suggestions under review. Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.	Use are expected to be negligible (EIS Section 32.2.8). Detailed assessment in EIS Section 12.0. **Addressed in Response to IR7-34:** As noted in the VFPA's response to IR7-34, mitigation measures currently undergoing consultation and evaluation include: • Crab Management Area re-selection opportunity; • Adjustment of proposed navigational closure area expansion with consideration of commercial harvesting during Project operation; • Adjustment of the proposed navigational closure area expansion with consideration of Indigenous harvesting during operation; • Navigational Limited Access Fishing Area (multi-user system during operation); and • Financial compensation. The evaluation of additional mitigation measures is being informed by consultation with commercial crab harvesters (including the Area I Crab Fisherman Association), Indigenous groups, DFO, and may include other relevant regulatory agencies regarding their specific interests and concerns. Evaluation of technical and economic feasibility of the suggested measures is currently underway to inform this consultation. Technical feasibility considers the following: • Availability, applicability, and effectiveness of the specific technology; • Fit with local site characteristics, Project design, construction schedule; • Applicable regulatory frameworks; and • Whether implementation is within the VFPA's jurisdiction. Economic feasibility considers the following: • Scope of the Project design (Project re-design not required); • Construction schedule (Project construction delay not required); and • Total cost of implementation of each measure during construction and/or operation.	24.6 Future Conditions with the Project – Potential Project-related Effects 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2.6 Current Use of Land and Resources for Traditional Purposes, Future Conditions with the Project – Potential Project-related Effects 32.2.7 Current Use of Land and Resources for Traditional Purposes, Mitigation Measures Current Use of Land and Resources for Traditional Purposes, Characterisation of Residual Effects and Context **Information Requests** Response to Information Request #34 (IR7-34 of CEAR Document #1172)
MFN-11.4	Asked whose responsibility it is to propose and implement mitigation measures for crab harvesting.	29-Oct-2014, Preliminary EIS Results Workshop #4	**29-Oct-2014, Workshop:** Stated that measures would involve the VFPA in collaboration with the commercial crab harvesting sector, and commercial crab license holders. A number of management plans will be developed. Stated that there will be more detail as the assessment progresses and the Project moves forward. **12-Apr-2018, Letter from the VFPA:** Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the RBT2 Crab Mitigation Summary Overview, which detailed the following: • Mitigation measures to avoid or reduce effects to crab as outlined in the EIS, and • Additional crab harvesting related mitigation measure suggestions under review.	**Addressed in EIS Section 21.0:** Mitigation measures proposed by the VFPA to address biophysical effects on marine invertebrates are outlined in EIS Section 12.0 Marine Invertebrates, and include timing of dredging activities to minimise direct mortality and physical injury effects of construction activities, salvaging Dungeness crabs where possible prior to dredging, infilling containment dykes, and storing sand at the intermediate transfer pit (ITP), as described in the Marine Species Salvage Plan (EIS Section 33.3.12 Environmental Management Program, Marine Species Salvage Plan). In addition, as part of the Construction Environmental Management Plan (EMP), VPFA will inform marine commercial operators about the nature, location, status, and progress of construction work through a communications plan (EIS Section 33.3.16 Communications Plan). In addition to mitigation measures specified in the above EIS sections, PMV [the VFPA] will work with DFO to ensure that consultation with commercial crab harvesters and Indigenous groups is undertaken to: • Communicate timing and spatial area of proposed navigational closure expansion for commercial crab harvesting; • Communicate access restrictions and procedures for maintenance of safety for commercial crab harvesting activity; and • Provide a process for commercial crab harvesters and Indigenous groups to ask questions and submit concerns about the proposed navigational closure expansion and associated displacement of commercial crab harvesting.	**EIS** 12.7 Marine Invertebrates 21.0 Marine Commercial Use 33.0 Environmental Management Program

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.	Where identified and agreed upon through this consultation process, VPFA will work with DFO and commercial crab harvesters and Indigenous groups to implement additional mitigation measures to address effects from displacement of commercial crab harvesting associated with the proposed navigational closure expansion during construction and operation.	
MFN-11.5	Concerned that the environmental assessment does not properly capture commercial fisheries, communal FSC fisheries in the assessment. Noted that protection of FSC resources is a priority for Musqueam. Requested that the commercial fishery and an economic opportunity under an Aboriginal Fishing Strategy (AFS) agreement be separated in the EIS. Stressed that it is not a commercial fishery if it's an AFS economic opportunity. Noted that economic opportunity is an FSC license where you're allowed to sell, so the context is flawed if economic opportunity numbers are included with commercial numbers as the primary data. It is explained that even though the license may be economic opportunity, sometimes the fish is just being taken home to eat (not to sell).	03-Jul-2014, VCs Workshop #2 29-Oct-2014, Preliminary EIS Results Workshop #4 19-Jul-2016, Issues Workshop - MFN / TFN #1	**03-Jul-2014, Workshop:** Recorded comment for consideration by Project team. **29-Oct-2014, Workshop:** Stated that data was gathered on individual communal licence holders. It is understood to be an economic opportunity. This discussion focuses mainly on commercial fisheries. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. **19-Jul-2016, Workshop:** In the context of the EIS, the VFPA took FSC to mean a communal license, including regular FSC licenses, limited participation licenses, and licenses with allowance for sale (economic opportunity licenses). The VFPA used "FSC" to mean these three types of licenses. Responded that the data gathered in the effects analysis and Marine Commercial Use assessment was focused on the commercial fisheries. Data on the FSC side were considered in more detail in the current use assessment for the EIS. Effort was made to separate out the analyses to make sure any contrasts between commercial and FSC fisheries were reflected. It was explained that the VFPA took FSC to mean a communal license, including regular FSC licenses, limited participation licenses, and licences with allowance for sale ("EO" licenses); the VFPA used "FSC" to mean these three types of licenses. The VFPA acknowledged in the EIS that, for Tsawwassen First Nation, "domestic" is the equivalent terminology to FSC. Domestic and FSC harvesting were considered in the current use section.	**Addressed in EIS Appendix 7.2-B (#118):** The Marine Commercial Use effects assessment includes commercial marine fish and seafood harvesting, including activities under communal commercial licenses held by Indigenous groups. Fish and seafood harvesting for food, social, ceremonial and domestic purposes (as per the AFS) by Indigenous groups are considered in EIS Section 32.0. **Addressed in EIS Appendix 7.2-B (#186):** It is the VFPA's understanding that Musqueam First Nation has an established right to fish for food, social, and ceremonial (FSC) purposes in Canoe Passage pursuant to R. v. Sparrow [1990], 1 S.C.R. 1075 and it is included as an information source with respect to Musqueam rights and interests. The VFPA further understands that Musqueam also assert an Aboriginal right to fish for FSC purposes over a broader area than Canoe Passage. Potential impacts of the Project on Musqueam's established Aboriginal right to fish for food, social and ceremonial purposes (pursuant to Sparrow) are addressed in the EIS, specifically within EIS Section 32.0, separately from potential effects to other Indigenous groups. **Addressed in Responses to IR10-06 and IR10-13:** The VFPA's responses to IR10-06 and IR10-13, as requested by the Review Panel, provide additional information concerning the rationale for the current use effects assessment conclusions.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 21.0 Marine Commercial Use 21.5.2 Aboriginal Commercial Fishing and Seafood Harvesting 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2.6 Future Conditions with the Project - Potential Project-Related Effects **Information Requests** Response to Sufficiency Information Request #6 (IR10-06) Response to Sufficiency Information Request #13 (IR10-13)
MFN-11.6	Concerned that data utilized for the marine commercial fishery section is not accurate, as commercial and sport fishers never report catch properly and DFO does not properly enforce reporting requirements.	30-Jan-2015, Meeting	**30-Jan-2015, Workshop:** Responded that this feedback would be included in the EIS Appendix 7.2-B. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in EIS Appendix 7.2-B (#103):** The assessment of ongoing productivity of commercial, recreational, and Indigenous fisheries focuses on Project-related effects on the productivity of species and habitats that support these fisheries. Results of this assessment were considered in the assessments of marine commercial use, outdoor recreation, human health, and Current Use. Further detail on the rationale for the scope, methods and information sources used in the CRA Fisheries assessment is provided in the EIS. **Addressed in EIS Appendix 7.2-B (#109):**	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 16.0 Ongoing Productivity of Commercial, Recreational, and Aboriginal Fisheries 16.2 Selection of Ongoing Productivity of Commercial,

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				Regulation and management of these fisheries occurs through the *Fisheries Act*, and is enforced by DFO. **Addressed in EIS Section 21.3.3:** Limitations to DFO's recreational and commercial fish and seafood harvesting data are described in EIS Sections 21.3.3 and 24.3.3. To supplement DFO data and further support these assessments, information on recreational and commercial fish and seafood harvesting was obtained through other secondary sources and through interviews with representatives from the commercial fish and seafood harvesting sector, DFO, B.C. Coastal Pilots, and Indigenous groups.	Recreational, and Aboriginal Fisheries Valued Component 16.4 Information Sources 16.5 Existing Conditions 16.6 Future Conditions with the Project 21.0 Marine Commercial Use 21.3.3 Administrative Boundaries 24.0 Outdoor Recreation 24.3.3 Administrative Boundaries

Table 12: Marine Fish – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-12.1	Concerned about Project impacts to Musqueam access and rights to fish within the area. Requested information on the construction, staging and storage facilities, including a diagram of the shipping routes for construction materials, expressing concern that they could impede further into the fishing area.	16-Jul-2013, Meeting 30-Aug-2013, Meeting 19-Nov-2014, Health & Aboriginal Rights Workshop - MFN	**16-Jul-2013, Meeting:** Recorded comment for consideration by the Project team. **30-Aug-2013, Meeting:** Recorded comment for consideration by the Project team. **19-Nov-2014, Meeting:** Committed to providing a response at a later date, to the extent that information becomes available. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. **19-Jul-2016, Issues Workshop - MFN / TFN #1:** Discussed concerns regarding marine fish (salmon, eulachon) and sought to better understand concerns.	**Addressed in EIS Appendix 7.2-B (#77):** Existing infrastructure at Roberts Bank, including the existing Roberts Bank terminals, are described in the EIS. The contribution of this infrastructure to existing conditions is considered, as appropriate, for each VC, including marine fish. The following are highlights of the marine fish assessment: • Overall, marine fish are expected to experience a minor decrease in productivity with the Project. • Minor decreases in productivity resulting from direct mortality and disturbance from underwater noise during Project construction, and permanent loss of subtidal sand habitat associated with the terminal footprint, can be partially mitigated through the implementation of environmental management plans and the creation of habitat. • Residual effects are anticipated for flatfish and forage fish as a result of subtidal sand habitat loss and underwater noise. Residual effects for reef fish are not anticipated. • The Project is not expected to result in any significant adverse residual effects to marine fish. • The Project is not expected to result in measurable incremental adverse cumulative effects to marine fish. The results of the marine fish assessment were considered in the assessments of marine mammals, coastal birds, ongoing productivity of commercial, recreational, and Indigenous fisheries, marine commercial use, outdoor recreation, human health, and Current Use. **Addressed in EIS Section 32.0:** Considers the results of effects assessments of potential Project and cumulative effects on marine vegetation, marine invertebrates, marine fish, marine mammals, coastal birds, marine commercial use, outdoor recreation, visual resources, land and water use, human health and archaeology and heritage resources, the ongoing productivity of commercial, recreational and Indigenous fisheries, as well the assessment of potential changes to air quality, noise and vibration, light and the assessment of potential accidents or malfunctions. The current use effects assessment considered potential effects on: • Access to preferred current use locations; • Availability of preferred current use resources; • Quality of preferred current use resources; and • Quality of current use experience Following implementation of the mitigation summarised in the EIS Section 32.2.7, adverse residual Project-related effects are expected to be negligible. Therefore, the Project is not expected to contribute to cumulative effects. **Addressed in Response to IR4-35:** The VFPA's response to IR4-35 Staging of Construction Materials provides location map and table summarising all lay down areas and stockpile areas to be used to stage materials for Project	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 13.0 Marine Fish 21.0 Marine Commercial Use 32.2.7 Current Use of Land and Resources for Traditional Purposes, Mitigation Measures 32.2.8 Current Use of Land and Resources for Traditional Purposes, Characterisation of Residual Effects and Context **Information Requests** Response to Sufficiency Information Request #35 (IR4-35 of CEAR Document #1051)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				construction including the ones identified in the Preliminary design 60287593-MA-221 (Causeway preload) and 602875-MA- 214 and 211 (Containment dyke). Specific staging areas and stockpile laydown areas will be determined by the Infrastructure Developer during detail design and construction planning phases for the Project. All staging and laydown areas can be accommodated within the Project footprint. Depending on the sequencing or phasing of construction activities undertaken by the Infrastructure Developer, several areas of the Project footprint will be available for temporary staging or stockpiling of construction materials; therefore, staging or storage areas outside the Project footprint to support construction activities are not required.	
MFN-12.2	Requested that groundfish be included as a species of traditional use.	19-Nov-2014, Health & Aboriginal Rights Workshop – MFN	**19-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in EIS Appendix 7.2-B (#103):** The assessment of ongoing productivity of commercial, recreational, and Indigenous fisheries focuses on Project-related effects on the productivity of species and habitats that support these fisheries. Results of this assessment were considered in the assessments of marine commercial use, outdoor recreation, human health, and Current Use. The assessment of marine fish focused on five sub-components: • Pacific salmon, represented by Chinook and chum species; • Groundfish, represented by lingcod and rockfish; • Forage fish, represented by Pacific herring and surf smelt; and • Crab, represented by Dungeness crab. Numerous literature and data sources, in addition to DFO, were consulted for information on commercial, recreational, and Aboriginal (CRA) fisheries, as described in the EIS, in addition to consultation with Indigenous groups and publicly available Indigenous traditional marine use or harvest data reports. Further detail on the rationale for the scope, methods and information sources used in the CRA Fisheries assessment is provided in the EIS. **Additional information provided by the VFPA:** Musqueam provided the VFPA with Traditional Musqueam Use of the Southern Fraser Delta (Leonard Ham 2014) and Contemporary Musqueam Use of the South Fraser Delta (Jason Woolman 2014), and information from these reports was incorporated into the EIS.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 16.0 Ongoing Productivity of Commercial, Recreational, and Aboriginal Fisheries 16.2 Selection of Ongoing Productivity of Commercial, Recreational, and Aboriginal Fisheries Valued Component 16.4 Information Sources 16.5.2 Existing Conditions, Recreational Fisheries
MFN-12.3	Stated that there is very little information on the eulachon and sturgeon populations in the river – unsure as to what the degree of impacts of their habitats would be – as there are no specific studies done on either of these species. Sturgeon are on the species at risk at and eulachon is very close to being placed on that list. Stated that outflow would be drawn into Canoe Pass and sensitive sturgeon and eulachon areas, as they are bottom feeders. Eulachon must also swim past the terminal and would be exposed to any pollution in the	15-Oct-2013, Letter to the CEA Agency (CEAR Document #41) 08-Jul-2014, Contemporary Musqueam Use of the South Fraser Delta Report	**08-Jul-2014:** Recorded comment for consideration by the Project team. **15-Oct-2015, Letter from the CEA Agency:** "The Agency has requested Information Requests on these items in its letter of July 31, 2015 to Port Metro Vancouver [the VFPA] (pages 4 and 7, #9 and 13)."	**Addressed in EIS Section 13.0:** Discussion regarding sub-component selection relative to species of importance to Indigenous groups, including eulachon and sturgeon, is captured in EIS Section 13.0. **Addressed in Response to AIR-12.04.15-09:** AIR-12.04.15-09 outlines in detail the selection process for VCs, sub-components, and representative species and rationale for selection. Discussion of how sockeye, sturgeon, and eulachon were captured in the assessment (i.e., by proxy) is provided. **Addressed in Response to IR5-15:** In its response to IR5-15, issued by the Review Panel on June 6, 2017 (CEAR Document #975), the VFPA specifically discusses	**EIS** 13.0 Marine Fish **Information Requests** Response to Additional Information Request #9 (AIR-12.04.15-09 of CEAR Document #388)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	area. This would affect not only the eulachon but also the sturgeon that feed on them. Requested information on the declining trajectory of change on sturgeon and eulachon, and the effects of further project development on the recovery of these two species of high concern to Musqueam. Stated that the assessment of past, current and future projects and activities on these species is of critical concern.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)		existing conditions related to eulachon and describes the status and management practices associated with the species. Rationale as to how eulachon were assessed via use of Pacific herring and surf smelt as representative species, as well as similarities between species as they pertain to existing conditions (e.g., life history and habitat requirements), the mechanisms through which the Project may affect eulachon, as well as effectiveness of mitigation, are presented in AIR 12.04.15-09 of CEAR Document #388, including Appendix AIR9-A Table 2; and in IR5-15 response. Potential effects on eulachon (as represented by Pacific herring and surf smelt) are assessed as minor, based on the low potential of eulachon to interact with the Project during terminal construction (adult eulachon presence in the LAA has not been confirmed, and eulachon larvae rear in the Strait of Georgia outside LAA boundaries). With implementation of mitigation measures (including adherence to the crab fisheries sensitive window and implementation of Construction Environmental Management Plans), no loss in eulachon productivity is anticipated. **Addressed in Response to IR5-15:** In its response to IR5-15, issued by the Review Panel on June 6, 2017 (CEAR Document #975), the VFPA specifically discusses existing conditions related to sturgeon and describes the status and management practices associated with the species. Rationale as to how sturgeon were assessed through the use of Chinook and chum salmon as representative species, as well as similarities between species as they pertain to existing conditions (e.g., life history and habitat requirements), the mechanisms through which the Project may affect sturgeon, as well as effectiveness of mitigation, are presented in AIR-12.04.15-09 of CEAR Document #388, including Appendix AIR9-A Table 2; and in IR5-15 response. Effects on Pacific salmon associated with changes in water quality and changes in biotic interactions are considered negligible.	
MFN-12.4	Noted salmon schooling on the banks prior to entering the river system would be exposed to any pollution build up in those areas. Stated that concern for salmon stocks was paramount.	08-Jul-2014, Contemporary Musqueam Use of the South Fraser Delta Report	**08-Jul-2014:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 13.0 Marine Fish.	**Addressed in EIS Section 13.0:** As outlined in EIS Section 9.6.8, while contaminants are present at Roberts Bank, they are closely associated with fine sediment and have therefore accumulated in locations outside those that will be disturbed by Project activities, such as the upper intertidal zones north of the causeway. No appreciable sediment contamination was observed in Project areas. Because sediments that will be re-suspended and deposited as a result of construction phase activities are not contaminated, changes in contaminant concentrations bioavailable to the food chain are not anticipated. Therefore, no effect on the productivity of marine fish is anticipated through this mechanism.	**EIS** 9.6.8 Surficial Geology and Marine Sediment, Future Conditions with the Project 13.0 Marine Fish
MFN-12.5	Stated that a 20 year study time is needed for salmon, as sockeye run on 4 year cycles.	30-Jan-2015, Meeting	**30-Jan-2015, Meeting:** Responded that feedback would be taken and included in EIS Appendix 7.2-B. **01-Apr-2015, Letter from the VFPA:**	**Addressed in EIS Appendix 7.2-B (#78):** A field sampling program for salmon was conducted at Roberts Bank in 2012 and 2013. While it is possible that 2012 to 2013 seasonal surveying for the Project did not capture all salmon species present at Roberts Bank, historical survey data add to the	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 9.0 Physical Setting

			Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	weight of evidence, suggesting a realistic representation of species composition and abundance at Roberts Bank.	9.5.8 Coastal Geomorphology, Future Conditions with the Project 9.7.8 Marine Water Quality, Future Conditions with the Project 13.0 Marine Fish 13.2 Selection of Marine Fish Valued Component 13.2.1 Sub-components 13.4.1 Information Sources, Desktop and Field Studies 13.5.1 Existing Conditions, Pacific Salmon 13.6 Future Conditions with the Project Table 13-6 Desktop and Field Studies Related to Marine Fish to Support the Assessment Table 13-10 Summary of Roberts Bank Ecosystem Model Productivity Results for Marine Fish 13.6.3 Potential Effect - Changes in Productivity
MFN-12.6	Expressed concern about eulachon and stated that they were trying to get the species back on track. Concerned with the use of representative/proxy species to assess potential effects to eulachon given its importance in terms of cultural significance, its relationship with other species and timing windows (seals, sturgeon, eagles), its endangered status and the efforts Musqueam have made to get DFO to put eulachon onto the appropriate Species at Risk lists. Stated that eulachon should be assessed as a species at risk. Asked how other species were used to represent eulachon. Stated that eulachon do not behave like herring. Stated that Eulachon transit the Project area. Requested that a targeted study be done on eulachon. Interested in providing feedback on potential additional studies and/or mitigation measures specific to eulachon.	16-Jul-2013, Meeting 19-Jul-2016, Issues Workshop - MFN / TFN #1 12-Sep-2016, Issues Workshop - MFN / TFN #2 03-Nov-2016, Letter to Panel (CEAR Document #776) 12-Jun-2017, Roberts Bank Boat Tour #1 12-Jun-2017, Meeting with Administrative Staff 16-Jun-2017, Meeting with Administrative Staff	**16-Jul-2013, Meeting:** Recorded comment for consideration by the Project team. **30-Aug-2013, Meeting:** Asked if Musqueam would be interested in participating in a specific study for a species such as eulachon. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. **19-Jul-2016, Workshop:** Stated that the assessment doesn't end at the EIS and if there are suggestions related to concerns or to monitoring and mitigation, the VFPA would welcome the feedback. **12-Sep-2016, Workshop:** Stated that in the case of eulachon, there is insufficient data to accurately capture potential pathways of effect. Given the life history of eulachon and the locations in which they are thought to spend their time as juveniles and adults before returning and transiting through the estuary, it was determined that other forage fish would be more suitable for capturing potential Project interactions. This is the rationale for not selecting eulachon as a focal	**Addressed in EIS Appendix 7.2-B (#80):** Potential Project-related effects on eulachon are considered in the marine fish assessment within the forage fish sub-component. Eulachon was not assessed directly as a representative species within the forage fish sub-component due to the rarity of eulachon in the Roberts Bank area. The assessment recognises eulachon as a species of high economic, societal, and cultural importance to Indigenous communities. **Addressed in EIS Section 13.2.1:** Eulachon was not assessed directly as a representative species within the forage fish sub-component due to the rarity of eulachon within the marine fish LAA. While eulachon are known to occur in Fraser River estuary waters (i.e., as adults during spawning migrations and as larvae flushed from Fraser River spawning sites), surveys at Roberts Bank and Sturgeon Bank in past years have not yielded high catches of eulachon. During the 2012 to 2013 fish surveying for the Project, no eulachon were caught. While few ichthyoplankton studies have targeted eulachon in estuarine or coastal waters of the Strait of Georgia, surveys describing the distribution of Pacific herring larvae (in April and May) found virtually no eulachon larvae in these areas; larvae are thought to be advected and dispersed southward toward the southern Gulf Island and San Juan Islands relatively quickly (i.e., within several days). **Addressed in Response to IR5-15:** The VFPA specifically discusses existing conditions related to eulachon and describes the status and management practices associated with the species. Rationale as to how eulachon were assessed via use of Pacific herring and surf smelt as	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 13.0 Marine Fish 13.2 Selection of Marine Fish Valued Component 13.2.1 Sub-components 13.4.1 Information Sources, Desktop and Field Studies 13.6.3 Potential Effect - Changes in Productivity 13.6.3.3 Changes in Productivity of Forage Fish **Information Requests** Response to Additional Information Request #09 (AIR 12.04.15-09 of CEAR Document #388) Response to Sufficiency Information Request #15 (IR5-15 of CEAR Document #1078) Response to Information Request #08 (IR-7.31.15-08 of CEAR Document #314) Response to Sufficiency Information Request #2 (IR10-02) Gustafson, R. G., L. Weitkamp, Y.-W. Lee, E. Ward, K. Somers, V. Tuttle, and

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Suggested that VFPA look at an eulachon egg larval survey funded by DFO that Musqueam and TFN were involved in. Noted there appears to be an increase in eulachon numbers this year [2017], though there is uncertainty as to why this is. Concerned about the eulachon run timing as it relates to construction activities and schedule. Requested construction schedules and mitigation plans specific to eulachon (spawning time, nature and timing of work in water, etc.) Noted Canoe Passage is a key holding area. Concerned that eulachon migration occurs outside of the DFO timing windows. Stated March through the end of June is a block of concern where eulachon come and sturgeon are still in the area. Stated that attrition and abundance are the eulachon's key to survival and if they can't get from point A to point B they are susceptible to predation. Noted connection between availability of and access to holding areas and the success of the species. Noted concern with the ability of holding areas to form and connection to coastal geomorphological influence and the training of rivers with dikes; noted connection to upriver removal of gravel beds used for spawning. Referred to old maps showing trenches at Roberts Bank that were used to get out of Canoe Passage, which are now all filled in. Explained the historic migratory patterns of eulachon: they moved from one sand bed to the next but they keep training the [Fraser] river and taking sand beds away. Roberts Bank is one of the last places with that morphology. That area is good for teaching about what it would have been like. Asked how the Project would affect the recovery potential of eulachon. Stated that given that recent population size [of eulachon] is two orders of magnitude less than the average abundance, asked how likely might it have been to encounter eulachon in the study area at an average abundance level of 1000 t.		species. In making the decision to exclude eulachon, the VFPA was conservative, by considering a species that was more likely to interact with the Project. Eulachon were considered in the ecosystem model. Their biomass was accounted for, but they were not selected as a representative species. Stated that fish studies were undertaken seasonally over two years to determine presence of species; no eulachon was caught. That led the VFPA to look at studies done over a decade on larval infection out of the Fraser. The VFPA recognises eulachon as a species of cultural importance and are funding a study with Tsawwassen First Nation and the Pacific Salmon Foundation on habitat use and the use of PIT tags. The VFPA is open to hearing suggestions for studies, mitigation and follow-up monitoring. Stated that the VFPA built an ecosystem model using EwE (Ecopath with Ecosim) in partnership with UBC and ESSA Technologies Ltd, and part of what it does is track food web interactions. In this way it's possible to take Pacific Sand Lance for example (Pacific Sand Lance and eulachon are at similar trophic levels), and use the model as a barometer to assess how there might be food web impacts to eulachon as a result of the Project. It wasn't overlooked, but was considered to have the same conclusion as its proxy species. Stated that herring is the main proxy species for eulachon, they have similar traits. They're both forage fish and are considered to be fairly similar. The main pathway of effect of herring was acoustic in nature, that is, behavioural changes from underwater noise. Eulachon have similar hearing ranges as herring. For fish, hearing is an emerging science, there is limited information. Of the fish species, herring was fairly well studied. The VFPA's conclusions around herring indicated a residual impact for noise, which would be applicable to eulachon as well. Asked what it could do to increase Musqueam's confidence or comfort with the assessment, and what sort of studies Musqueam would like to see (for e.g. larval eulachon, tracking of abundance and movements). **12-Jun-2017, Meeting:** Asked about past work undertaken with other proponents. Noted a lot of thought is being put into mitigation and Musqueam's input is valuable.	representative species, as well as similarities between species as they pertain to existing conditions (e.g., life history and habitat requirements), the mechanisms through which the Project may affect eulachon, as well as effectiveness of mitigation, are presented in AIR 12.04.15-09 of CEAR Document #388, including Appendix AIR9-A Table 2; and in IR5-15 response. As noted in that IR response, assessment conclusions and mitigation measures for representative species also apply to eulachon remain unchanged. As reported in the IR, the recovery potential for the Fraser River eulachon population was evaluated using a Bayesian stock reduction model (Gustafson et al. 2016). The analysis indicates that stock levels for 2009 to 2011 are at only about 3% to 11% of the original (1900s) unfished stock size (McAllister 2012). The population should rebuild to 33% to 49% of the unfished abundance over a period of 16 years to 18 years, under conditions of average historical productivity, no increase in bycatch mortality from shrimp trawling effort, and no direct exploitation. The analysis suggests that the population is relatively unproductive and can sustain a maximum fishing mortality rate of only 0.10 of the unfished population. A directed catch of 30 metric tonne would reduce stock rebuilding up to 30% of the unfished population (Gustafson et al. 2016). **Addressed in Response to IR10-02:** The VFPA's response to IR10-02, as requested by the Review Panel, provides further information concerning how available Indigenous knowledge was incorporated into the EIS and MSA. **Additional information provided by the VPFA:** The VFPA acknowledges the importance of eulachon to Indigenous groups and has worked to support eulachon habitat through its Habitat Enhancement Program (HEP). In 2014, HEP provided funding to Pacific Salmon Foundation to support a Fraser River Eulachon Habitat Utilization Survey. This survey involved capturing and tagging 300 eulachon to better understand habitat use as eulachon undergo physical changes prior to river entry and spawning and to gather information to support habitat rehabilitation and abundance recovery. In 2017, HEP provided funding to the Lower Fraser Fisheries Alliance to support an assessment and recovery project for eulachon in the Fraser River.	J. Jannot. 2016. Status Review Update of Eulachon (*Thaleichthys pacificus*) Listed under the *Endangered Species Act*: Southern Distinct Population Segment. #	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Requested that the Proponent provide estimates of the abundance of eulachon larvae as well as adult eulachon around the Project area when the Fraser spawning biomass index was in the 1000 tonne range or greater. Requested that the Proponent provide a supplementary submission that combines both historical data and Musqueam traditional knowledge (and other ITK). Requested a supplementary submission on the potential effects of the Project on eulachon, specifically taking into consideration Musqueam ITK indicating that the Project Footprint is directly in the path of migrating eulachon traversing the Salish Sea to Roberts Bank and into Fraser River South Arm. Requested additional field work survey data as required to corroborate ITK findings and assess potential adverse effects.		Responded that construction is proposed to follow DFO timing windows and there would be no in-water works during restricted times. Responded that the RBT2 team would like to know if it has not properly understood or identified timing windows. **16-Jun-2017, Meeting:** Responded any information Musqueam could share related to spawning habitat would be helpful. Noted an intensive eelgrass project is planned as part of the Project and it would be possible to discuss looking at enhancing eulachon habitat in other areas.		
MFN-12.7	Concerned that the Project area is used as a fish holding area before they begin their migration up the Fraser River.	19-Jul-2016, Issues Workshop - MFN / TFN #1	**19-Jul-2016, Workshop:** The VFPA concluded that there are no additional effects beyond what's documented in the EIS. The effects pathways that would affect holding sockeye (light, noise), those pathways are adequately captured in the EIS. The VFPA's understanding of holding areas is that the holding area is quite large and includes Point Roberts, Gibsons, and the Gulf Islands. The fish are holding in that area. Roberts Bank comprises a small portion of this larger area. From that perspective there is limited potential in overlap in space for that to occur. If Musqueam has more information that can be shared about salmon holding in specific areas, please share it with the VFPA.	**Addressed in Response to IR5-15:** In its response to IR5-15, issued by the Review Panel on June 6, 2017 (CEAR Document #975), the VFPA specifically discusses existing conditions related to sockeye and describes the status and management practices associated with the species. The IR response also further assesses potential effects of the project on Sockeye directly. Regarding salmon holding: • Studies examining sockeye holding in relation to RBT2 were not conducted; hence, no evidence exists to deny or substantiate the claims made by Indigenous groups. • This issue was briefly discussed in EIS Section 13.2.1, p. 13-7, with the conclusion that there is no scientific evidence that waters at or near Roberts Bank represent holding areas for adult sockeye. As described in the response to IR5-15, based on existing literature, there is no formally defined holding area within the Fraser River estuary for returning adult sockeye. It appears that the brackish layer or plume within which adult sockeye may hold can extend as far north as Gibsons Landing, as far west and south as the Gulf Islands (from Gabriola Island near Nanaimo to Saturna Island at Boundary Passage), and as far east at Point Roberts area. However, since 1995, sockeye holding behaviour appears to have ceased.	**Information Requests** Response to Sufficiency Information Request #15 (IR5-15 of CEAR Document #1078)
MFN-12.8	Concerned that Project-related marine shipping will lead to altered predation patterns and increased mortality of Musqueam fish harvesting resources.	24-May-2016, Musqueam First Nation Marine Shipping Effects Assessment	**24-May-2016:** Recorded comment for consideration by the Project team. **20-Jun-2016, Meeting:** Recorded comment for consideration by the Project team.	**Addressed in AIMSA – MFN and TWN Appendix 2-B (#11):** The assessment of marine fish and fish habitat in the MSA assessed potential direct effects on the productivity of marine fish from vessel wake and underwater noise.	**MSA** 8.1 Marine Fish and Fish Habitat 8.1.5.5 Marine Fish 8.1.6 Potential Interactions and Effects 8.2 Marine Mammals

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
		20-Jun-2016, Meeting	**30-Sep-2016, Letter from the VFPA:** Responded that comments have been included and incorporated in the AIMSA, and will also be submitted directly to the Review Panel and posted on the public registry. Enclosed AIMSA Appendix 2-B showing the issues raised by Musqueam First Nation and the VFPA's responses.	**Addressed in MSA Section 8.1:** Discusses potential effect to marine fish related to marine shipping associated with the Project. An assessment was undertaken to evaluate the potential effects of Project-associated marine shipping on marine fish and fish habitat (including marine vegetation and marine invertebrates) within the marine shipping area and located within the Salish Sea. Potential effects of vessel wake-generated waves on marine fish and fish habitat were characterised as negligible, because only 2% of coastline in the LAA is within the wake-related zone of influence, and because wake-generated wave heights at shorelines are predicted to be well within the range of natural wave conditions. Fish and fish habitat are already adapted to the natural conditions; therefore, any wake-related influences would not be distinguishable from existing conditions. Similarly, potential effects of underwater noise were also considered to be negligible because noise associated with Project-associated marine vessel activity and future cumulative shipping activities would not exceed injury thresholds for fish species or the Pacific salmon species behavioural threshold. Further, while noise-induced behavioural changes are possible for Pacific herring, potential effects would be localised to within 20m of a container ship and of short duration (as the ship passes by) and are therefore not anticipated to affect the integrity of populations within the LAA.	8.2.6 Potential Interactions and Effects **AIMSA – MFN and TWN** Appendix 2-B Aboriginal Issues and Interest 7.0 Current Use of Lands and Resources for Traditional Purposes and Aboriginal and Treaty Rights 7.3.2 Availability of Preferred Current Use Resources 8.0 Potential Accidents or Malfunctions 8.5 Potential Effects of Accidents or Malfunctions on Current Use and Rights
MFN-12.9	Requested additional time to more fulsomely examine whether the EIS includes adequate data on the resilience and vulnerability of marine and inter-tidal species, comparing "Volume 3" and its appendices to Musqueam's rich ATK and fisheries technical team's access to technical information that has been collected over time. Stated that to facilitate this review, we request the Agency require the Proponent to clarify for each species of interest where exactly in Volume 3 of the EIS the information related to the assessment of resilience and vulnerability – and changes over time in the abundance, distribution and population health of the species – is available for review and comment.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency notes that there is time to review the available information prior to the Panel initiating its sufficiency review particularly given that a panel is not yet in place. Musqueam is encouraged use this time to review the EIS and begin its sufficiency review. With respect to funding, the Agency notes that Musqueam has applied for and received funding for each funding opportunity available through the Agency's Participant Funding Program."	**Addressed in EIS Sections 11.0, 12.0, 13.0 and 14.0:** As part of each biophysical VC section in the EIS (Volume 3), the existing conditions section discusses resilience and vulnerability of sub-components and representative species within each sub-component.	**EIS** 11.0 Marine Vegetation 12.0 Marine Invertebrates 13.0 Marine Fish 14.0 Marine Mammals
MFN-12.10	Requested that the EIS be revised to include a fulsome consideration of the findings of the Cohen Commission Final Report.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."	**Addressed in EIS Section 13.0:** Information in the Cohen Commission Final Report was an information source for this section of the EIS. Where applicable, the Report's information is used and referenced.	**EIS** 13.0 Marine Fish
MFN-12.11	Stated that in order to properly assess fish habitat distribution, the Proponent must provide a link to where in the draft EIS the required information actually is, or generate	15-Jun-2015, Letter to the CEA Agency (CEAR	**15-Oct-2015, Letter from the CEA Agency:** "The Agency has requested additional information regarding Aboriginal Traditional	**Addressed in EIS Section 13.4.1:** In 2012, the VFPA initiated field, desktop, and modelling environmental studies on marine fish to support Project planning and EA. 	(i) Musqueam ITK and (ii) the threatened/endangered status of these species: a. Eulachon (Fraser River), b. Lower Fraser White Sturgeon, c. Interior Fraser Coho, and d. Cultus Lake Sockeye				
MFN-12.15	Requested information on Pacific Salmon: The Proponent must provide more information regarding assumptions used in developing estimations of effectiveness of mitigation measures, as well as confidence in those estimations.	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in Response to IR-7.31.15-12:** Explains how the mitigation measures proposed in the EIS are meant to reduce significance, and discusses the anticipated effectiveness of the proposed mitigation measures.	**Information Requests** Response to Information Request #12 (IR-7.31.15-12 of CEAR Document #314)
MFN-12.16	Requested information on Adult Sockeye from Late Run Stocks in Dominant Years: The Proponent must submit a supplementary analysis that provides clear baseline data to demonstrate what impact the Project would reasonably be expected to have on adult sockeye from late run stocks in dominant years that contribute millions of catch to First Nations, commercial and recreational fisheries.	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in Response to IR5-15:** The VFPA specifically discusses existing conditions related to sockeye and describes the status and management practices associated with the species. The IR response also further assesses potential effects of the project on Sockeye directly.	**Information Requests** Response to Sufficiency Information Request #15 (IR5-15 of CEAR Document #1078)
MFN-12.17	Stated Inappropriate Use of Fish and Fish Habitat Assessment as "Proxy" for Effects on Availability of Resources for Rights-Based Harvesting: The Proponent should undertake additional consideration of (i) potential impacts on Musqueam species of high cultural, social and economic concern (both those currently harvested and not harvested due to closures) related to the sufficiency of resources, and (ii) the potential time-lag factors that may delay the efficacy of mitigations (i.e. habitat offsetting) leading to potential downward fluctuations in abundance of species of high cultural, social, or economic concern, and the potential closure of harvesting by federal conservation officials.	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in Response to IR10-14:** The VFPA's response to IR10-14, as requested by the Review Panel, further discusses potential economic implications of any permanent or temporary displacement related to the navigational closure, including in terms of sufficiency of resources at alternate locations to meet the requirements of the community. **Addressed in Response to IR10-10:** The VFPA's response to IR10-10, as requested by the Review Panel, discusses the potential effects of the proposed Project on availability of preferred traditional resources taking into account the time lag required for the establishment of functioning habitat offsets.	**Information Requests** Response to Sufficiency Information Request #10 (IR10-10) Response to Sufficiency Information Request #14 (IR10-14)
MFN-12.18	Requested Incorporation of Highly Relevant Ongoing Research: Requested that the Panel direct the Proponent to incorporate ongoing research into juvenile salmon species, (including outmigration, residency time, and size of as well as occurrence and abundance of juvenile salmon species across the delta flats at Roberts Bank) into its re-assessment of potential effects of the Project on juvenile salmon, specifically regarding the	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Appendix 7.2-B (#78):** A field sampling program for salmon was conducted at Roberts Bank in 2012 and 2013. While it is possible that 2012 to 2013 seasonal surveying for the Project did not capture all salmon species present at Roberts Bank, historical survey data add to the weight of evidence, suggesting a realistic representation of species composition and abundance at Roberts Bank.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 9.0 Physical Setting 9.5.8 Coastal Geomorphology, Future Conditions with the Project 9.7.8 Marine Water Quality, Future Conditions with the Project 13.0 Marine Fish

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	established "current condition" of juvenile salmon species that may be effected by the Project. We note that this is research being conducted by the Rainforest Conservation Foundation in 2016 and 2017 throughout the Fraser River estuary. Musqueam views this research as having the potential to being highly relevant to understanding the current and past impacts of the existing man-made causeway structures on Roberts Bank. If timelines do not permit these research results to be completely incorporated into the EIS, any preliminary results that are available should be incorporated into the EIS, and the Panel should take into account the final research results in later stages of the EA process.				13.2 Selection of Marine Fish Valued Component 13.2.1 Sub-components 13.4.1 Information Sources, Desktop and Field Studies 13.5.1 Existing Conditions, Pacific Salmon 13.6 Future Conditions with the Project Table 13-6 Desktop and Field Studies Related to Marine Fish to Support the Assessment Table 13-10 Summary of Roberts Bank Ecosystem Model Productivity Results for Marine Fish 13.6.3 Potential Effect - Changes in Productivity
MFN-12.19	Asked if marine migration is an important aspect of Lower Fraser White Sturgeon population dynamics, including exchange with other populations such as the Columbia River, what would be the impact of the Project on the long term viability of the population? Stated that there should be directed research on the presence of Sturgeon in marine areas. To date, PIT tags have been the major tool for studying sturgeon migration behaviour. More use of acoustic tags and other technologies will be needed to study sturgeon in the marine areas.	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 13.0:** Potential Project-related effects on white sturgeon have been assessed in the EIS through the use of representative Pacific salmon species (see EIS Sections 13.6.2.1, 13.6.2.2, and 13.6.3.1). **Addressed in Response to IR5-15:** The VFPA specifically discusses biology, migration behaviour, habitat utilisation, status and management practices associated with white sturgeon. As noted in that IR response, assessment conclusions and mitigation measures for representative species also apply to white sturgeon (Lower Fraser population) and remain unchanged.	**EIS** 13.0 Marine Fish **Information Requests** Response to Sufficiency Information Request #15 (IR5-15 of CEAR Document #1078)
MFN-12.20	Requested a supplemental filing on potential impacts of the Project on Interior Fraser Coho. Requested a supplemental filing on potential impacts of the Project on Cultus Lake Sockeye. Stated that while the late summer runs have had a reduced delay period, in the area of the Project, the dominant years (2014, 2010, 2006…) have still demonstrated a significant delay of 2 to 3 weeks, of millions of adult sockeye (including Cultus Lake Sockeye), in the area that includes the Project. Requested a supplementary submission that provides clear baseline data and analysis to demonstrate the impact that the Project would reasonably be expected to have on these adult sockeyes from late run stocks in dominant years that contribute millions of	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in Response to IR5-15:** The VFPA specifically discusses biology, migration behaviour, habitat utilisation, the status and management practices associated with interior Fraser River coho and Cultus Lake sockeye. As noted in that IR response, assessment conclusions and mitigation measures for these represented species remain unchanged.	**Information Requests** Response to Sufficiency Information Request #15 (IR5-15 of CEAR Document #1078)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	catch to First Nations, Commercial and Recreational fisheries.				
MFN-12.21	Requested a supplementary submission to reevaluate its cumulative effects assessment based on above reassessment of potential effects on eulachon, sturgeon, endangered Fraser salmon species and delaying Late Run sockeye salmon stocks. Stated that if the George Massey Tunnel Replacement Project (including tunnel removal works), the WesPac Tilbury LNG Marine Export Terminal Project, and the Pattullo Bridge Replacement Project, and ongoing maintenance dredging of the Fraser River South Arm – all of which include dredging and/or changes to river hydraulics, sedimental transports, and thus also potential changes to fish habitat in the Fraser River Estuary, were included in Table 13-17, how would that effect the conclusion on cumulative effects? Stated that the Proponent should reconsider the cumulative effects in light of the omissions of ongoing river maintenance dredging, and three proposed projects under EA review that fall within the regional study area.	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Table 8-8:** Provides a list of other certain or reasonably foreseeable projects and/or activities that were considered in VC cumulative effect assessments. George Massey Tunnel Replacement Project (including tunnel removal works and the Pattullo Bridge Replacement Project were included in the Inclusion list, and therefore considered in VC cumulative effects assessments. Ongoing maintenance dredging of the Fraser River South Arm is an existing activity and is therefore represented in existing and future conditions cases, which in turn are considered in VC cumulative effects assessments. **Addressed in Response to IR4-09:** Publicly available information concerning the WesPac Tilbury LNG Marine Export Terminal Project was not available at the time of EIS writing, but information concerning the project's related ship movements is included in Sufficiency Information Request #09 (IR4-09). The Project remains in an environmental scoping phase overseen by the BC Environmental Assessment Office. The VFPA assumes the WesPac Tilbury LNG Marine Export Terminal Project will appropriately mitigate its potential effects, and notes that if any unmitigable residual effects were predicted from the Project, they are unlikely to interact spatially or temporally with RBT2.	**EIS** 8.0 Effects Assessment Methods **Information Requests** Response to Sufficiency Information Request #09 (IR4-09 of CEAR Document #1051)
MFN-12.22	Requested a supplementary submission to address current gaps in relation to the inclusion and consideration of Musqueam traditional knowledge pertinent to proper characterization of existing conditions of fish species of significant cultural concern. Stated that of particular importance, Musqueam notes that its own cultural knowledge regarding the proximity of annual eulachon migration through Roberts Bank towards Canoe Passage has not been canvassed by the Proponent or integrated into the assessment.	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information. **12-Sep-2016, Issues Workshop:** The VFPA met with Musqueam First Nation and Tsawwassen First Nation to discuss concerns raised around eulachon. Noted that with regard to the use of representative species, salmon captures the anadromous features of eulachon, herring have similar hearing, and Pacific Sand Lance feed on the same things. Explained that if the intent is to accurately capture potential pathways of effect, to do that you need data. In the case of eulachon there is not sufficient data. In the case of Fraser eulachon, they were not studied as part of the Project. Given the life history of eulachon, and the locations they are thought to spend their time as juveniles and adults before coming back and transiting through the estuary, it was thought that other forage fish would be more suitable to capture potential Project interactions. That's the rationale for not selecting eulachon as a focal species. In making the decision to exclude eulachon, we were trying to be as	**Addressed in EIS Appendix 7.2-A:** On January 18, 2013, representatives from the Musqueam Fisheries Department participated in a meeting with PMV [the VFPA] to help identify information on food, social and ceremonial (FSC) fisheries (both finfish and shellfish) occurring within the Project assessment area. During the EIS Development Phase, PMV [the VFPA] met with Musqueam representatives on four separate occasions to discuss and coordinate the development of Musqueam's TU and ITK studies (February 21, April 7, June 18, and August 5, 2014). On April 7, 2014, PMV [the VFPA] met with Musqueam to review the previously identified sources of ITK related to Musqueam for work being done to include ITK and current use in the EIS. **Addressed in Response to IR10-02:** The VFPA's response to IR10-02, as requested by the Review Panel, provides further information concerning how available Indigenous knowledge was incorporated into the EIS and MSA.	**EIS** Appendix 7.2-A Aboriginal Group Consultation **Information Requests** Response to Sufficiency Information Request #02 (IR10-02)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			conservative as possible and consider species that were most likely to interact with the Project. It doesn't mean eulachon are not considered—they were built into the ecosystem model, their biomass was accounted for, but they were not selected as a representative species. Noted that eulachon wasn't selected as a representative species in the biophysical world, but in the Aboriginal rights and interests section, the relationship your community has with eulachon was covered and it was captured.		
MFN-12.23	Concerned that normal shipping operations may affect fishing resources through pollutants washing off the ships, deliberate fouling of the water by irresponsible crews, and the release of polluted and contaminated (e.g., with invasive species) ballast water into the region.	15-Nov-2017, Letter to Panel (CEAR Document #1098)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Appendix 7.2-B (#100):** The VFPA was the first port in North America to prohibit in-port ballast water exchange without prior mid-ocean exchange, a practice which became the basis of government requirements now enforced by Transport Canada. To prevent the invasion of foreign species into local waters, international regulations, through the International Maritime Organization, are managed by Transport Canada. All commercial deep sea vessels are required to carry out a ballast water exchange prior to entering Canadian waters. This is done outside the exclusive economic zone of 200 nautical miles (nm) and in water deeper than 2,000 m. By requiring vessels to complete this ballast "flush" well outside Canadian waters, the aim is to prevent any foreign organisms from entering into the local ecosystem. The U.S. has similar requirements, and vessels arriving from the Puget Sound area need to forward the completed U.S. forms to Canadian authorities prior to entry into Canadian waters. **Additional response from the VFPA:** In Transport Canada's response to the Review Panel's Information Requests of May 10, 2017 (CEAR Document #982), Transport Canada has indicated that with respect to chronic oiling, the use of anti-fouling agents, and discharges of ballast water, bilge water, and sewage, that marine water quality in the marine shipping area is not expected to change because these potential contributors are regulated by the *Canada Shipping Act,* 2001, and in particular the Vessel Pollution and Dangerous Chemicals Regulations (VPDCR) under this act. Furthermore, Transport Canada states that "In relation to the Project, the technical requirements of the VPDCR apply to all vessels over 400 gross tonnage. As such, all container ships and most tugs serving container ships that would call at the proposed RBT2 would be subject to these requirements".	**EIS** 4.0 Project Description 4.4.2 Operation-phase Activities Appendix 7.2-B Aboriginal Groups Interests and Issues Table 9.7 Marine Water Quality 9.7.8 Future Conditions with the Project **TC IR-02 to TC IR-06, from Transport Canada to the Review Panel Re: Response to Information Requests issued by the Review Panel on May 10, 2017 (CEAR Document #982)**
MFN-12.24	Concerned about the disruption of salmon and crab migration routes and lifecycles from construction and physical occupation of the Project. Concerned about increased disruption of fishing activities from siltation and sedimentation from construction.	15-Nov-2017, Letter to Panel (CEAR Document #1098)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Sections 12.0 and 13.0:** EIS Sections 12.0 and 13.0 discuss salmon and crab migration routes and lifecycles from construction and physical occupation of the Project. As described in EIS Section 9.6, changes to surficial geology and marine sediment during Project construction activities are expected to be minimal or undetectable relative to natural variability.	**EIS** 9.6 Surficial Geology and Marine Sediment 12.0 Marine Invertebrates 13.0 Marine Fish

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-12.25	Concerned about the loss of valued habitat and increased mortality rate of fishing resources from the disruption of tidal flows.	15-Nov-2017, Letter to Panel (CEAR Document #1098)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 13.0:** EIS Sections 13.0 discusses potential project effects to fish and fish habitat. Overall, marine fish are expected to experience a minor decrease in productivity in the future with the Project. Minor decreases in productivity are anticipated during the construction and operation phases for all marine fish sub-components, with the exceptions of negligible changes in productivity for certain species including adult Chinook and chum salmon (representative species for sockeye and other Pacific salmon species) and lingcod, and an increase in productivity for shiner perch during the operation phase. Productivity decreases can be partially mitigated through the implementation of environmental management plans and the creation of habitat. Residual effects are anticipated for flatfish and forage fish as a result of permanent loss of subtidal sand habitat associated with the terminal footprint and disturbance from underwater noise. The assessment concludes there are no significant adverse effects from the Project, as marine fish productivity or long-term integrity would not be compromised. The Project is not expected to result in measurable incremental adverse cumulative effects to marine fish	**EIS** 13.0 Marine Fish
MFN-12.26	Concerned that the creation of the proposed Roberts Bank Terminal 2 would increase rates of predation on salmon and crabs by hosting predators such as lingcod, seals, and octopus.	15-Nov-2017, Letter to Panel (CEAR Document #1098)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 10.0:** EIS Section 10.0 also considers predation rates as part of the Roberts Bank Productivity Model, a trophic model that predicts predator-prey interactions in the future with the project case. These predicted interactions were considered as pathways of effects discussed in EIS Sections 12.0 and 13.0 and supported the conclusions of the EIS relating to marine invertebrates and fish: while the Project is predicted to cause losses of productivity of bivalve shellfish, Dungeness crabs and orange sea pens, the scale of change is minor in the context of natural variability and would not compromise the population integrity or ecological function. The assessment concludes there are no significant adverse residual effects from the Project to marine invertebrates. The Project is not expected to result in any incremental adverse cumulative effects to marine invertebrates. The assessment concludes there are no significant adverse effects from the Project, as marine fish productivity or long-term integrity would not be compromised. The Project is not expected to result in measurable incremental adverse cumulative effects to marine fish.	**EIS** 10.0 Biophysical Setting
MFN-12.27	Concerned that humans were not included in the food web model. Noted eulachon is part of Musqueam's and Tsawwassen's cultural identities and they are part of the food chain, not apart from it; they are stewards of these species.	19-Jul-2016, Issues Workshop - MFN / TFN #1 12-Sep-2016, Issues Workshop - MFN / TFN #2	**19-Jul-2016, Workshop:** Recorded comment for consideration by the Project team. **12-Sep-2016, Workshop:** Noted that while eulachon wasn't selected as a representative species in the biophysical world, the relationship your community has with eulachon was covered and is captured in EIS Section 32.0.	**Additional information provided by the VFPA:** The model does not explicitly incorporate anthropogenic influences such as fishing. Since changes are determined by comparing productivity in the future with the Project, to the future without the Project, the level of human influence is deemed to be the same with and without the Project, and humans are not explicitly included in the food web. However, the existing conditions for species included in the model are reflective of existing harvesting levels by humans; therefore, human interaction within the model is implicit.	**EIS** 10.0 Biophysical Setting 10.3 Overview of Assessing Ecosystem Productivity Appendix 10.3-A Roberts Bank Ecopath with Ecosim and Ecospace Model Parameter Estimates Appendix 10.3-B Roberts Bank Ecosystem Model Development and Key Run

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				Addressed in Response to IR3-09: IR3-09 asked the VFPA to re-run the RB model to incorporate the predominant source of fishing mortality at Roberts Bank: Dungeness crab fishing. Salmon harvesting was not included as salmon harvesting occurs over large geographic areas (i.e., Gillnet Salmon Area E, Seine Net Salmon Area B, Troll Salmon Area H), and is considered limited at Roberts Bank, with only a small proportion of the salmon catch coming from areas in the periphery of or adjacent to Roberts Bank; as such salmon fishing mortality was considered to be unlikely to influence model results. The results showed that biomass and production ratios (with/without Project) from the RB model re-run, including Dungeness crab fishing mortality, are generally the same when compared to the ratios described in the EIS.	Appendix 10.3-C Roberts Bank Spatial Ecosystem Model Sensitivity Analysis Appendix 10-D Roberts Bank Spatial Ecosystem Model Sensitivity Analysis

Table 13: Marine Invertebrates – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-13.1	Concerned about potential impacts to crabs, with a focus on the Musqueam food fishery. Stated that commercial crab fishery is already facing declining crab stocks and many Musqueam members have invested large amounts of money in the fishery.	18-Oct-2013, Meeting 19-Nov-2014, Health & Aboriginal Rights Workshop - MFN	**18-Oct-2013, Meeting:** Recorded comment for consideration by the Project team. **19-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **12-Sep-2016, Issues Workshop - MFN / TFN #2:** Explained that here are other mitigation measures for crab in addition to the salvage plan. DFO sensitive timing windows have been written into the schedule to protect the gravid female life history, which is from October 31 to March 15. During that time no works would happen below 5m chart datum. Specific to the salvages, the intent is to avoid direct mortality and to keep that productivity within the system. By doing this those moved will at least avoid certain death. Once moved, crabs can move out of the area. Noted that regarding the ITP, the VFPA is looking into alternatives. **26-Jun-2017, Email from the VFPA:** The concerns brought forward by Musqueam First Nation with regard to Dungeness Crabs, disposal at sea (DAS), and, in particular, the ITP highlighted the need for the VFPA ("the port authority") to re-evaluate our planned construction approach and use of the ITP as a part of the Project. The Project Team has been actively exploring alternative construction methods to address concerns raised by Indigenous groups and regulatory agencies since the development of the EIS in 2014. After undertaking a thorough investigation that included further engineering work, consideration of new locally available dredging equipment, and relaxation of the *Coasting Trade Act* as a result of approving the Canadian European Trade Agreement, the port authority determined that the Project could proceed without the use of an ITP. In addition, the elimination of the ITP, along with other changes will result in a Project that does not require a DAS permit. **12-Apr-2018, Letter from the VFPA:** Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the RBT2 Crab Mitigation Summary Overview, which detailed the following: • Mitigation measures to avoid or reduce effects to crab as outlined in the EIS; and • Additional crab harvesting related mitigation measure suggestions under review.	**Addressed in EIS Section 32.3.2.2:** The potential impact from the Project to Musqueam's ability to crab and Musqueam's crabbing rights, is addressed in EIS Section 32.3.2.2. This section concludes that the Project is expected to impact the ability of Musqueam First Nation to exercise the asserted right to harvest marine resources (crabs) based on potential changes in access to a preferred crab harvesting location. **Addressed in EIS Table 32-7:** Presents a summary of Mitigation Measures to Address Potential Impacts on the Exercise of Aboriginal or Treaty Rights, and includes commitments including but not limited to: • Work with DFO to ensure necessary consultations with Indigenous domestic or FSC crabbers concerning the proposed expansion of the area closed to commercial and recreational crabbing. • Support Indigenous domestic or FSC crabbing within the area closed to commercial and recreational crabbing. **Addressed in Project Construction Update:** As requested by the Review Panel, the VFPA submitted the Project Construction Update (PCU) on June 12, 2018, providing: • Detailed revised Project description, including a revised construction schedule; • Revised Project interaction matrix; • Preliminary details pertaining to the management and timing of dredging activities and the discharge of sediment-laden water; and • Revised assessment of environmental effects as required by the Project modifications. PCU Sections 1.0 and 2.0 describe the changes to the EIS, including updates to specific construction activities, the construction schedule, and relevant Project Description figures and appendices. In PCU Section 3.0, changes or effects resulting from the construction updates on ICs and VCs are described. Overall, these changes to the EA resulting from construction updates can generally be summarised as follows: • Reductions in potential adverse changes or effects on ICs, biophysical VCs, social VCs, and Current Use; and • Increases in positive interactions with socio-economic VCs. These beneficial changes to ICs and VCs occur at the level of interactions or potential effects, and in most cases are slight changes, and thus do not affect the overall conclusions made in the EIS, including proposed mitigation, residual effect characterisations, significance determinations or cumulative effects, as applicable, with one exception. The only component predicted to have a change to residual effects is land and water use, with a reduction of a residual effect on access to Tsawwassen First Nation community lease lands from a measurable non-significant residual effect to a negligible residual effect, due to elimination of the ITP and associated activities.	**EIS** 12.0 Marine Invertebrates 16.0 Ongoing Productivity of Commercial, Recreational, and Aboriginal Fisheries 21.0 Marine Commercial Use 21.6 Future Conditions with the Project – Potential Project-related Effects 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes 32.2.6 Future Conditions with the Project - Potential Project-Related Effects **Project Construction Update (PCU; CEAR Document #1210)**

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.		
MFN-13.2	Concerned with the potential effects on crabs, particularly in relation to black material observed in crabs harvested in the area. Requested that VFPA provide kits for crabbers in order to facilitate proper storage and ensure compliance. Concerned about blackened crabs in the vicinity of the Westshore terminal in Roberts Bank due to their exposure to coal dust from the terminal that had settled on the seafloor and on their shells. Noted black crabs at Roberts Bank and stated that Musqueam won't keep those crabs. Described observing blackened crab due to their exposure to coal dust that had settled on the seafloor and on their shells.	02-Jul-2014, Meeting 24-May-2016, Musqueam First Nation Marine Shipping Effects Assessment 22-Aug-2016, Community Member / Commercial Crabber and MFN Staff Meeting Re: Crabbing 12-Jun-2017, Roberts Bank Boat Tour #1 15-Nov-2017, Letter to Panel (CEAR Document #1098)	**02-Jul-2014, Meeting:** Recorded comment for consideration by the Project team. **18-Jul-2014, Meeting:** Discussed black crab study with Musqueam. **05-Aug-2014, Email from the VFPA:** The VFPA wishes to undertake field studies to further investigate Musqueam First Nation and Tsawwassen First Nation concerns regarding a black material observed in Dungeness crabs (*Metacarcinus magister*) previously harvested from the Fraser River estuary (Roberts Bank, Sturgeon Bank, and Boundary Bay) **07-Aug-2014, Email from the VFPA:** Provided information on a study that [the VFPA] is undertaking related to black material observed in Dungeness crabs previously harvested from the Fraser River estuary. Stated that this black material has been noticed by Tsawwassen and Musqueam First Nation crabbers in DFO Fisheries Management Areas 28 and 29 and as such we are working with these communities in the collection of crabs for testing. Provided details on the purpose, methodology, study area, and timeframe. **09-Jul-2015, Email from the VFPA:** Followed up to previous communications and the Dungeness Crab field study notification of August 2014. Attached a letter and memorandum regarding the studies undertaken by Hemmera in response to reports from Indigenous groups to the VFPA regarding blackening of Dungeness crab and concerns related to potential contamination. The memo included a summary of findings. The results of both studies were the same: • There is no evidence of coal contamination, based on the results of sensitive tissue • chemistry analysis testing for PAHs, metals, and trace elements; • Consumption risks are acceptably low and pose no risk to human health; and • The underlying cause of the blackened shells is determined to be shell disease (a common condition due to bacterial infection of existing lesions/damage in the crab shells). **12-Apr-2018, Letter from the VFPA:** Stated that since concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and	**Addressed in EIS Section 27.0 and EIS Appendix 27-C:** Addresses potential effects of contaminant-related consumption risks of Dungeness crab, where contaminant analysis of crab tissue and the completion of a human health risk assessment was completed to support the development of the EA. The leg muscle tissue did not contain detectable PAH concentrations, in spite of the use of sensitive laboratory analytical methods. Only arsenic was present in concentrations of potential concern and, consequently, was carried forward in a quantitative human health risk assessment; it was concluded that arsenic-associated health risks from the consumption of Dungeness crab tissue are acceptably low. **Addressed in Responses to IR4-33 and IR4-34:** Further information concerning the VFPA's investigations into 'blackened' crabs is provided in IR4-34 Marine Invertebrates: Blackened Crab Study (CEAR Document #946) In summary, black lesions were observed on four of the five crabs collected by Indigenous harvesters. The black lesions were concluded to be consistent with chitinolytic shell disease, generically referred to as "shell disease", a condition common to crab and other crustaceans. This disease is caused by a bacterial or fungal infection of an area where the outer layer of the shell has been previously damaged. Shell disease has not been linked to contamination. The disease is not specific to the Roberts Bank area and is present across the Pacific Northwest, including Alaska and B.C. and in Atlantic Canada. In its response to *IR4-33 Marine Fish – Marine Invertebrates: Contaminants in Crab Hepatopancreas* issued by the Review Panel on March 31, 2017 (CEAR Document #1078), the VFPA provided results of the study. In summary: A crab hepatopancreas study was conducted at Roberts Bank to determine the concentrations of contaminants of concern in crab hepatopancreas in the LAA. In June 2017, Dungeness crab were collected from five traps placed at each of the three study locations (15 traps total). Twelve adult male crabs were harvested from each of the three sites (36 crab total). Samples were submitted under chain of custody to analytical laboratories accredited by the Canadian Association for Laboratory Accreditation (CALA) for the analysis requested. The analysis was completed in August 2017. Collectively, the results of a statistical comparison across sites indicate that the average concentrations of PCBs, coal indicator elements, arsenic compounds, and PAHs measured in hepatopancreas from crab collected from the RBT2 and ITP sites are not statistically higher than those measured in crab from the Canoe Passage reference site. This suggests that existing sediment and water quality in and around the existing terminal and proposed RBT2 terminal are not contributing to contaminant concentrations in crab hepatopancreas that are higher than levels found in crab hepatopancreas from the Canoe Passage reference site.	**EIS** 12.0 Marine Invertebrates 12.4.1 Desktop and Field Studies Table 12-4 Marine Invertebrates Studies to Support the Assessment 12.5.3 Existing Conditions, Dungeness Crabs 12.6.2 Future Conditions with the Project, Negligible Effects 27.0 Human Health 27.6.4 Potential Effect # 3 – Adverse Health Effects due to Stress and Annoyance - Perceived Contamination Appendix 27-C Shellfish Harvesting Potential and Contaminant-related Consumption Risks at Roberts Bank **Information Requests** Response to Sufficiency Information Request #33 (IR4-33 of CEAR Document #1078) Response to Sufficiency Information Request #34 (IR4-34 of CEAR Document #1051) **Memorandum Re: Summary Report – Roberts Bank Dungeness Crab Health Studies**

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the following documents review: • IR4-33 - Crab Hepatopancreas Additional Study Summary; • IR4-34 - Black Crab Additional Studies Summary; and • Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.		
MFN-13.3	Concerned with the proposed navigational closure expansion negatively affecting the commercial crab fishery in Subarea 29-6, and disagreed that the effect will be negligible. Expressed interest in meeting again and setting up a forum with fishers, the port authority and DFO to come up with a solution that works for everyone, ideally re-opening the navigational closure area to commercial crabbers as a no-float zone, as was initially implemented before. Noted previous restrictions that were implemented in the area were detrimental but what is proposed would be much worse. Noted the closure would push then further out and would result in a decrease of income referring the 2009 closure by DFO. Noted that crab does not migrate and baited traps may lead them to other areas, such as Area J and H, than the mitigation suggestions and could infringe on FSC activities. Noted the area taken for commercial fishing would push them into FSC areas.	22-Aug-2016, Community Member / Commercial Crabber and MFN Staff Meeting Re: Crabbing 23-Feb-2017, Community Member / Commercial Crabber and MFN Staff Meeting Re: Crabbing	**22-Aug-2016, Meeting:** Committed to take back the information and follow up as the consultation process for commercial crab fisheries is formalised. **23-Feb-2017, Meeting:** Recorded comment for consideration by the Project team. **12-Apr-2018, Letter from the VFPA:** Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the RBT2 Crab Mitigation Summary Overview, which detailed the following: • Mitigation measures to avoid or reduce effects to crab as outlined in the EIS; and • Additional crab harvesting related mitigation measure suggestions under review. Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.	**Addressed in EIS Appendix 7.2-B (#117):** Marine commercial use, or the use of marine waters and resources to generate revenue, has been identified as an important economic factor in local and regional communities, and for Indigenous groups. The marine commercial use assessment included four sub-components: • Seafood harvesting; • Marine fish harvesting; • Guided sport fishing; and • Marine-based tourism. Potential effects on marine commercial use include displacement of commercial crab harvesting during construction and operation, resulting in a potential change of harvesting area, total harvest, and revenue, due to the Project footprint and the proposed expansion of the area closed to commercial crabbing. The VFPA will work with DFO to engage commercial crab harvesters to identify and implement feasible mitigation measures; and will implement construction and operation environmental management plans related to construction phase communication, construction monitoring and crab salvages effects from displacement of commercial crab harvesting during construction and operation. The Project is anticipated to result in a negligible effect to marine fish harvesting, guided sport fishing and marine-based tourism. These negligible effects are related to changes in area, access, resource availability and harvesting revenues. The Project is expected to result in a residual effect of changes to seafood harvesting area, harvest and revenue. The residual effect is determined to be not significant, as Dungeness crab are known to move substantial distances to baited traps, and harvest activity can be moved to another open area. Other planned or reasonably foreseeable projects and activities would also displace crab harvesting, and this effect would combine with that of the Project to result in an incremental cumulative effect on commercial crab fishing. This adverse incremental cumulative effect is determined to be not significant. **Addressed in Response to IR7-34:** As noted in the VFPA's response to IR7-34, mitigation measures currently undergoing consultation and evaluation include: • Crab Management Area re-selection opportunity; • Adjustment of proposed navigational closure area expansion with consideration of commercial harvesting during Project operation; • Adjustment of the proposed navigational closure area expansion with consideration of Indigenous harvesting during operation;	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 12.0 Marine Invertebrates 16.0 Ongoing Productivity of Commercial, Recreational, and Aboriginal Fisheries 21.0 Marine Commercial Use 21.6 Future Conditions with the Project – Potential Project-related Effects 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes 32.2.6 Future Conditions with the Project - Potential Project-Related Effects **Information Requests** Response to Sufficiency Information Request #07 (IR7-34 of CEAR Document #1172)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				• Navigational Limited Access Fishing Area (multi-user system during operation); and • Financial compensation. The evaluation of additional mitigation measures is being informed by consultation with commercial crab harvesters (including the Area I Crab Fisherman Association), Indigenous groups, DFO, and may include other relevant regulatory agencies regarding their specific interests and concerns. Evaluation of technical and economic feasibility of the suggested measures is currently underway to inform this consultation. Technical feasibility considers the following: • Availability, applicability, and effectiveness of the specific technology; • Fit with local site characteristics, Project design, construction schedule; • Applicable regulatory frameworks; and • Whether implementation is within the VFPA's jurisdiction. Economic feasibility considers the following: • Scope of the Project design (Project re-design not required); • Construction schedule (Project construction delay not required); and • Total cost of implementation of each measure during construction and/or operation.	
MFN-13.4	Concerned that displacement of fisheries will not be limited to commercial license holders only (i.e. AFS fishers), as DFO often closes the same areas for commercial and Aboriginal harvests. Commented that MFN cannot FSC harvest because of the existing closure and concerned that the proposed navigational closure will further inhibit FSC harvesting activities. Clarified MFN can FSC harvest in the existing closure area but there is a cumulative effect from the commercial and recreational closure. Explained the large population of commercial and recreational harvesters outside the closure area push MFN out forcing them to move to another area. Because there are traps all around the area crabs get picked off as they migrate through. Explained it is not denial of access but restriction of other users and competition increases in some areas; it pushes MFN harvesters out along the shelf and increases tension between FSC and non-FSC fishers on the water (provided examples of gear being stolen and having lost over	29-Oct-2014, Preliminary EIS Results Workshop #4 12-Jun-2017, Roberts Bank Boat Tour #1	**29-Oct-2014, Workshop:** Stated that the VFPA understands DFO closures would only apply to DFO commercial licence holders. Areas that are closed are still open to the Indigenous fishery. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. **12-Jun-2017, Meeting:** Responded that the proposed closure would only apply to commercial harvesters. **16-Jun-2017, Meeting:** Responded the clarification matches VFPA understanding; closure area is closed to floats but allows FSC. Requested Musqueam's input on the proposed closure. **12-Apr-2018, Letter from the VFPA:** Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the RBT2 Crab Mitigation Summary Overview, which detailed the following: • Mitigation measures to avoid or reduce effects to crab as outlined in the EIS, and • Additional crab harvesting related mitigation measure suggestions under review. Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.	**Addressed in EIS Appendix 7.2-B (#120):** In the Marine Commercial Use assessment, a residual effect is considered significant when all of the following conditions are met: • The effect occurs to a known area of commercial marine-based activity or potential; • The effect displaces or excludes commercial marine-based activities from a known use area; • There are associated adverse harvest or revenue effects due to the displacement; and • The displaced commercial marine-based activity cannot move to known alternative activity areas due to regulatory reasons. The Project is expected to result in a residual effect of changes to seafood harvesting area, harvest and revenue. This residual effect is determined to be not significant, however, as Dungeness crab are known to move substantial distances to baited traps, and harvest activity can be moved to another open area. The potential for an adverse effect related to changes in access to preferred Current Use locations for crab is discussed in EIS Section 32.2.6. With the implementation of mitigation measures (EIS Section 32.2.7), residual Project-related effects on Current Use are expected to be negligible (EIS Section 32.2.8). At a subsequent meeting on 16-Jun-2017, sought clarification on the comment that the existing navigational closure inhibits Musqueam FSC harvesting activities, since the information went against the VFPA's understanding. Musqueam confirmed they can FSC harvest in the area but explained there is a cumulative effect related to the commercial and recreational closure (identified to the left). **Addressed in Response to IR10-07:** The VFPA's response to IR10-07, as requested by the Review Panel, further discusses potential economic implications of any permanent or temporary displacement related to the navigational closure.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 21.0 Marine Commercial Use 21.7 Future Conditions with the Project – Potential Project-related Effects 21.10 Determination of Significance of Residual Adverse Effects Table 21-10 Summary of Determination of Significance of Residual Effects for Marine Commercial Use 24.0 Outdoor Recreation 24.6 Future Conditions with the Project – Potential Project-related Effects 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2.6 Current Use of Land and Resources for Traditional Purposes, Future Conditions with the Project – Potential Project-related Effects 32.2.7 Current Use of Land and Resources for Traditional

	500 pieces of gear over two seasons by people hooking and pulling away which become ghost fishing machines that stay down for a long time destroying things). Referred to working with DFO and CCG to undertake ghost fishing gear recovery.				Purposes, Mitigation Measures Current Use of Land and Resources for Traditional Purposes, Characterisation of Residual Effects and Context **Information Requests** Response to Sufficiency Information Request #07 (IR10-07)
MFN-13.5	Concerned with the effectiveness of crab salvage as a mitigation measure. Interested in future discussions specific to related mitigation measures. Asked for an estimate of how many crabs will need to be relocated. Concerned that it doesn't sound like work has been done to tag and track crabs to see where they would end up if relocated. Suggested baiting outside the Project area to draw crabs away as opposed to baiting within the Project area and relocating them. Concerned that moving them may put more stress on another crab area. Stated that crabs can migrate fast and what may seem like a far distance could be a short distance for a crab. Suggested tagging crabs to determine where they are travelling.	12-Sep-2016, Issues Workshop - MFN / TFN #2 03-Nov-2016, Letter to Panel (CEAR Document #776)	**12-Sep-2016, Workshop:** Noted that the VFPA intends to consult with Musqueam and Tsawwassen on the details and specifics of mitigation measures. Stated that the specifics such as how many traps, how long it would be for, etc., would be developed in consultation with First Nations and regulators. The intent was to trap within the area before construction and move them elsewhere in the Roberts Bank area. Stated that crab salvaging could be accomplished by trapping or using SCUBA divers to harvest them. They would be moved within their home range—a couple of kilometres—at Roberts Bank, but outside of the construction area. **12-Apr-2018, Letter from the VFPA:** Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the RBT2 Crab Mitigation Summary Overview, which detailed the following: • Mitigation measures to avoid or reduce effects to crab as outlined in the EIS; and • Additional crab harvesting related mitigation measure suggestions under review. Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.	**Addressed in EIS Section 32.0:** The EIS specifically acknowledges impacts to the Musqueam First Nation's ability to exercise the asserted Aboriginal right to harvest crab for food, social, or ceremonial purposes As noted in EIS Section 32.0, the Project is not predicted to adversely impact the ability of Indigenous groups to exercise most asserted or established Aboriginal and treaty rights. The only exception is the harvesting of crabs for domestic or food, social or ceremonial purposes, it is predicted the Project would likely impact Tsawwassen First Nation's ability to exercise the treaty right to fish for crab for domestic purposes based on potential changes in access to a primary crab harvesting location. For similar reasons, such Project-related effects would also be expected to impact Musqueam First Nation's ability to exercise the asserted Aboriginal right to harvest crab for food, social, or ceremonial purposes. These effects are expected to be accommodated by the measures identified to avoid, reduce or otherwise address predicted effects on current use. **Addressed in Response to IR5-04:** The VFPA's response to IR5-04, as requested by the Review Panel, provides additional information concerning the proposed Dungeness crab salvages. Salvages were conducted to meet the conditions of the *Fisheries Act* Authorisation for DP3. Cutter suction dredging was preceded by ongoing crab salvages (where baited traps were set in advance of dredging and crabs relocated approximately 2 km from the project area) and a visual dive survey (where divers provided visual confirmation of no crabs prior to initial dredging) (Hemmera 2009). In the case of clamshell dredging, visual inspections of the collected dredgeate were made by the contractor's crews and the environmental monitor; only one crab was identified within the dredgeate during the entire project (Hemmera 2009), underscoring the effectiveness of this measure. In consultation with Indigenous groups, the VFPA has heard a suggestion to bait outside the Project area to draw crabs away as opposed to baiting within the Project area and relocating them. The VFPA is currently exploring this option and will determine an appropriate approach to this mitigation method through engagement with relevant regulatory agencies, stakeholders, and Indigenous groups.	**EIS** 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes **Information Requests** Response to Sufficiency Information Request #4 (IR5-04 of CEAR Document #1209)
MFN-13.6	Concerned about the loss of viable habitat for and increased mortality rates of shellfish resources from dredging and construction, including the generation of silt and deposition of sediments.	15-Nov-2017, Letter to Panel (CEAR Document #1098)	The VFPA has reviewed this letter and provides the following additional information. **12-Jun-2017, Meeting:** Explained there is a predicted adverse residual effect to crabs as a result of the Project that is predicted to be not significant. The adverse effect is related to the permanent loss of subtidal sand habitat under the footprint of the Project, and the effects to crabs in the ITP.	**Addressed in EIS Section 12.0:** While the Project is predicted to cause losses of productivity of bivalve shellfish, Dungeness crabs and orange sea pens, the scale of change is minor in the context of natural variability and would not compromise the population integrity or ecological function. The assessment concludes there are no significant adverse residual effects from the Project to marine invertebrates. The Project is not expected to result in any incremental adverse cumulative effects to marine invertebrates. The assessment concludes there are no significant adverse effects from the Project, as	**EIS** 9.6 Surficial Geology and Marine Sediment 12.0 Marine Invertebrates 13.0 Marine Fish **PCU (CEAR Document #1210)**

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			Further explained that crab salvages will be undertaken to mitigate effects, where crabs will be removed from the terminal footprint prior to in-filling. Noted there have also been dredging guidelines established by DFO to minimise direct mortality and physical injury to crabs, where dredging below -5 m would be restricted from mid-October to the end of March. Noted other mitigation measures such as the construction of on-site eelgrass habitat, which is good habitat for juvenile crabs. Noted the VFPA is exploring alternatives to the ITP, and if it were no longer required that would further lessen the impacts to crabs. **26-Jun-2017, Letter from the VFPA:** The concerns brought forward by Musqueam First Nation with regard to Dungeness Crabs, DAS, and, in particular, the ITP highlighted the need for the VFPA ("the port authority") to re-evaluate our planned construction approach and use of the ITP as a part of the Project. The Project Team has been actively exploring alternative construction methods to address concerns raised by Indigenous groups and regulatory agencies since the development of the EIS in 2014. After undertaking a thorough investigation that included further engineering work, consideration of new locally available dredging equipment, and relaxation of the *Coasting Trade Act* as a result of approving the Canadian European Trade Agreement, the port authority determined that the Project could proceed without the use of an ITP. In addition, the elimination of the ITP, along with other changes will result in a Project that does not require a DAS permit.	marine fish productivity or long-term integrity would not be compromised. The Project is not expected to result in measurable incremental adverse cumulative effects to marine fish. **Addressed in EIS Section 9.6:** Changes to surficial geology and marine sediment during Project construction activities are expected to be minimal or undetectable relative to natural variability. **Addressed in PCU:** As requested by the Review Panel, the VFPA submitted the PCU on June 12, 2018, providing: • Detailed revised Project description, including a revised construction schedule; • Revised Project interaction matrix; • Preliminary details pertaining to the management and timing of dredging activities and the discharge of sediment-laden water; and • Revised assessment of environmental effects as required by the Project modifications. PCU Sections 1.0 and 2.0 describe the changes to the EIS, including updates to specific construction activities, the construction schedule, and relevant Project Description figures and appendices. In PCU Section 3.0, changes or effects resulting from the construction updates on ICs and VCs are described. Overall, these changes to the EA resulting from construction updates can generally be summarised as follows: • Reductions in potential adverse changes or effects on ICs, biophysical VCs, social VCs, and Current Use; and • Increases in positive interactions with socio-economic VCs. These beneficial changes to ICs and VCs occur at the level of interactions or potential effects, and in most cases are slight changes, and thus do not affect the overall conclusions made in the EIS, including proposed mitigation, residual effect characterisations, significance determinations or cumulative effects, as applicable, with one exception. The only component predicted to have a change to residual effects is land and water use, with a reduction of a residual effect on access to Tsawwassen First Nation community lease lands from a measurable non-significant residual effect to a negligible residual effect, due to elimination of the ITP and associated activities.	
MFN-13.7	Noted presence of ghost shrimp in mudflat habitat and suggested their incorporation to the mudflat on-site habitat work.	16-Jun-2017, Meeting with Administrative Staff	**16-Jun-2017:** Recorded comment for consideration by Project team.	**Additional information provided by the VFPA:** Beyond the offsetting measures suggested in EIS Section 17.0, the VFPA encourages Indigenous groups participating in the EA to suggest specific offsetting measures for consideration.	**EIS** 17.0 Mitigation Framework for Marine Biophysical Valued Components
MFN-13.8	Stated that the EIS should be revised to include the following: 1. Evidence that consultation with Musqueam on the conceptual fish habitat compensation plan has occurred; 2. Details of how consultation with Musqueam has informed the conceptual fish habitat compensation plan;	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency has requested additional information regarding Aboriginal Traditional Knowledge in its letter of July 31, 2015 to Port Metro Vancouver [the VFPA] (page 3, #8). A discussion on the content of the Aboriginal Traditional knowledge used is best considered during the panel's sufficiency review."	**Addressed in Response to IR-7.31.15-08:** Response to IR-7.31.15-08 provides a description of where and how ITK has been used to support the selection of VCs, baseline descriptions, the assessment of effects including the identification of mitigation measures, and in the determination of significance of adverse environmental effects. **Addressed in EIS Section 17.3.2.2:** In EIS Section 17.3.2.2, the VFPA presented proposed onsite habitat offsetting concepts to Indigenous groups, stakeholders, and the public at open houses and small group meetings, starting in fall 2014. **Addressed in Response to IR 7-31:**	**EIS** 17.0 Mitigation Framework for Marine Biophysical Valued Components **Information Requests** Response to Information Request #8 (IR-7.31.15-08 of CEAR Document #314)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	3. Information on how ATK was used in the development of the conceptual fish habitat compensation plan, including proposed locations for fish habitat compensation components to be implemented; Evidence that Musqueam knowledge of the effectiveness of previous fish habitat compensation plans and other fish habitat related offsets, has been considered in the development of onsite habitat concepts.			The VFPA's forthcoming response to IR7-31, as requested by the Review Panel, provides a summary of the views of Indigenous groups in relation to the proposed mitigation measures that were considered in the preparation of the EIS for each biophysical valued component, including views about offsetting.	Response to Sufficiency Information Request #31 (IR7-31)

Table 14: Marine Mammals – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-14.1	Concerned with the potential impacts on marine mammals. Concerned with the impacts to salmon affecting SRKW.	30-Jan-2015, Meeting	**30-Jan-2015, Meeting:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. **10-May-2017, Email from the VFPA:** Provided Musqueam with a copy of the Enhancing Cetacean Habitat and Observation (ECHO) program annual report for 2016. The ECHO program is a VFPA-led collaborative initiative aimed at better understanding and managing the cumulative impacts of shipping activities on at-risk whales throughout the southern coast of B.C.	**Addressed in EIS Appendix 7.2-B (#92):** Project-related adverse residual effects to southern resident killer whales (SRKW) (and all toothed whales) are expected to be not significant. The Project contribution of effects above existing conditions is very small and is not anticipated to adversely affect individuals or affect critical habitat features (acoustic environment, the availability of prey, and water and sediment quality) when needed by SRKW for their life functions of foraging, mating, resting, or socialising. Destruction of SRKW critical habitat from Project construction and operation is not anticipated, and the Project will not limit the survival or recovery of SRKW. Cumulative effects to baleen whales and seals and sea lions are expected to be not significant. However, due to their Endangered status and lack of recovery of the population, the VFPA has assumed that past activities and projects, including those described in the recovery strategy issued by DFO, have had a significant adverse effect on SRKW. Therefore, the Project, in combination with past projects and activities that have been carried out, and certain and reasonably foreseeable projects that will be carried out, will result in a continued significant cumulative effect to SRKW. **Addressed in Response to IR4-10:** As noted in response to IR4-10, in 2014, the VFPA-led ECHO Program is a collaborative initiative aimed at better understanding and managing the impact of shipping activities on at-risk whales throughout the southern coast of B.C. The ECHO Program engages and involves key regional interested parties to maximise program success and help ensure that mitigation and management measures developed through the program are informed by social, cultural, economic, and environmental sustainability interests. The ECHO Program is guided by the advice and input of an advisory working group, and supported by a federal government advisory committee and associated technical committees. Through engagement and consultation with stakeholders, including Indigenous individuals, the ECHO Program has initiated or supported short-term projects, scientific studies, and educational initiatives to fill knowledge gaps necessary to inform the development of credible, science-based threat reduction solutions and management options to reduce cumulative effects of shipping to at-risk whales in the region. Further information about ECHO Program can be found at: https://www.portvancouver.com/environment/water-land-wildlife/echo-program/.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 14.0 Marine Mammals 14.5 Existing Conditions 14.6 Future Conditions with the Project 14.7 Mitigation Measures 14.10 Cumulative Effects Assessment 33.0 Environmental Management Program 33.5 Roberts Bank Terminal 2 Follow-up Program **Information Requests** Response to Sufficiency Information Request #10 (IR4-10 of CEAR Document #1051)

Table 15: Marine Shipping Addendum

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-15.1	Stated that there has been inadequate capacity funding to date to enable our meaningful participation in this project review.	07-Oct-2015, Letter to the CEA Agency	**11-May-2016, Letter from the CEA Agency:** "The Agency Participant Funding Program (PFP) is intended to provide limited funding to Indigenous groups to assist them to prepare for and participate in consultation activities and key participation opportunities associated with environmental assessments (EAs). The Agency is not able to cover all expenses incurred. The Agency made $56,000 available to the Musqueam to support your participation in the EA and consultation activities for the Project, and Musqueam applied for and was allocated $42,959. With respect to EA and consultation activities specifically related to marine shipping associated with the Project, Musqueam applied for and was allocated $49,264.86 out of the additional $53,031 that was made available for this purpose. This was the same amount offered to the Tsawwassen First Nation, the other Indigenous group assessed as high on the preliminary depth of consultation assessment spectrum. The Agency has contacted Bryan Nelson, Manager Project Development - Aboriginal Consultation with VFPA multiple times and encouraged VFPA to provide additional capacity funding to Musqueam to support your participation in the EA process for the Project. VFPA has said they have offered funding to Musqueam but have not yet received any responses to the funding offers. VFPA committed to resuming the conversation about funding with Musqueam in the near future. The Agency understands VFPA has provided capacity funding to the Musqueam to enable you to provide input on marine shipping associated with the Project."	**Additional information provided by the VFPA:** **11-Mar-2016:** Offered funding for a Musqueam-led Marine Shipping Effects Assessment. **14-Mar-2016:** Accepted funding. **24-May-2016:** Musqueam First Nation provided Marine Shipping Effects Assessment report to the VFPA.	
MFN-15.2	Requested that the Agency use Section 23 of CEAA 2012 to require the proponent to develop a study on impact of shipping on rights and on environmental effects related to Musqueam interests.	07-Oct-2015, Letter to the CEA Agency	**11-May-2016, Letter from the CEA Agency:** "Section 23 of the Canadian Environmental Assessment Act, 2012 (CEAA 2012) only applies to EAs by the Agency (i.e. standard EAs). However, the same powers are available in all phases of an EA by Review Panel under sections 39 (pre-panel phase), section 44 (panel phase) and section 47 (post-panel phase) of CEAA 2012… The Agency has required VFPA to submit additional information in order to ensure that the requirements of the EIS Guidelines have been met… Once the completeness review is completed, the Panel will be appointed. The Panel will then conduct the technical sufficiency review of the information provided by VFPA. Under Section 44(2) of CEAA 2012, if the Panel is of the opinion that there is not sufficient information available for the purpose of conducting the EA or preparing its report, it has the authority to require VFPA to collect any information or undertake any	**Addressed in AIMSA – MFN and TWN:** On October 4, 2016, the VFPA submitted supplementary information related to the additional study and engagement that was undertaken regarding the MSA, per the CEA Agency's letter from January 13, 2016. The additional information summarises potential impacts of marine shipping associated with the Project as it relates to the exercise of potential or established Aboriginal or Treaty rights of the Musqueam First Nation (and Tsleil-Waututh Nation). **AIMSA – MFN and TWN Section 1.0:** The purpose of this document, the AIMSA, is to provide supplementary information to the EIS, specifically the MSA. The information included here is based on additional information (from either pre-existing sources, or provided directly to the VFPA in a new study) pertaining to Musqueam First Nation and Tsleil-Waututh Nation and the findings of the MSA. **Additional information provided by the VFPA:** In support of the VFPA's AIMSA draft, the VFPA provided funding Musqueam to produce a Musqueam First Nation Marine Shipping Effects	**AIMSA – MFN and TWN** 1.0 Purpose of the Additional Information to the Marine Shipping Addendum

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			studies that it feels are necessary. Once the Panel is appointed, the Musqueam could ask the Panel to require the type of study referenced in your letter."	Assessment report. The VFPA received this report on 24-May-2016 and it was considered in the AIMSA.	
MFN-15.3	Concerned that two separate assessments will be conducted – one of the "Project" that only includes shipping to the boundary of VFPA jurisdiction, and a second, diminished assessment of marine shipping from the outer boundary of VFPA jurisdiction out to the 12-nautical-mile limit.	07-Oct-2015, Letter to the CEA Agency	**11-May-2016, Letter from the CEA Agency:** "The Minister of Environment and Climate Change has included marine shipping associated with the Project as a factor to be considered in the EA. There will be one EA conducted and all of the factors to be considered with respect to potential environmental effects (i.e. section 19 of CEAA 2012) will be assessed for both the Project and marine shipping associated with the Project. Information collected on marine shipping associated with the Project will be provided to the Minister for her consideration for her duty to consult obligations and her EA decision. The Panel has been directed to provide its assessment of marine shipping associated with the Project within the Panel report. The assessment of the marine shipping outside the care and control of VFPA conducted by the Panel will be a full assessment and include all the factors outlined in section 19 of CEAA 2012. The reason for the differentiation between the Project and the marine shipping associated with the Project is that the Minister will not include any conditions in the EA Decision Statement issued to VFPA on marine shipping outside VFPA's care and control, should the project be allowed to proceed. Instead, any outstanding issues related to marine shipping associated with the Project will be dealt with by Canada in other ways, depending on the conclusions and recommendations of the Panel. Any information brought forward in relation to potential impacts from marine shipping associated with the Project on Aboriginal rights will be included in the adequacy of consultation assessment. The Minster is the final decision maker on whether or not consultation was adequate for the purposes of her EA decision.		

MFN-15.4	Requested that the Agency provide Musqueam with a copy of any federal government policy on marine shipping scoping for our review. If there is no current federal policy in place, we request that you provide Musqueam with an explanation for (1) why such a policy is not in place, and (2) why the marine scoping decision for RBT2 is so divergent from the federal EA scoping decisions made for other BC projects involving	07-Oct-2015, Letter to the CEA Agency	**11-May-2016, Letter from the CEA Agency:**
			"Based on operational experience, the Agency has developed a number of factors to assist in determining whether or not to include marine shipping in the scope of assessment for a designated project. These factors include the following:
			• Does the proponent have care and control of the vessels?
			  ○ If yes, then marine shipping is part of the Project as defined by CEAA 2012 Project Regulations?
			  ○ If no, the Agency considers:		

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	marine shipping, including but not limited to: • Enbridge Northern Gateway Pipeline Project • LNG Canada • Pacific Northwest LNG • Raven Coal		• What is the extent to which marine shipping relates to the designated project? • What is the extent to which marine shipping is for the sole benefit of the project proponent? and, • Any other factors that may be relevant, such as whether there is a contractual relationship between the proponent and the shipping company. When determining whether to recommend to the Minister that additional factors should be considered in an EA under subsection 19(1)(j) of CEAA 2012, the Agency considers several criteria, including: 1. How the matter is relevant to the EA; 2. The degree and nature of federal control over the matter; 3. The linkage of the component or activity to the designated project; 4. The nature and level of public concern regarding the matter; 5. Whether an Aboriginal group has identified that marine shipping will have an adverse impact on their rights; and 6. The existence of or planning for a forum to receive and use the output of the EA on this matter. Please note that not all criteria have to be met. In applying the criteria noted above, each project is considered based on its own unique merits. Some of the considerations that guided the decisions on the projects listed in your letter include: • Enbridge Northern Gateway Pipeline Project – the ships were intended for use solely by the Enbridge Northern Gateway Pipeline Project, thus the proponent had ability to impose conditions on the ships through contractual tools. • LNG Canada Project - proponent had care and control of ships. • Pacific Northwest LNG Project - proponent had care and control of ships. • Raven Coal Project - the proponent had care and control of the ships through contractual relationships. For the Project, VFPA would not have direct control over the ships coming in and out of the port outside of the area they control directly around the terminal, should be the project be allowed to proceed. Therefore, the circumstances of the Project are different from the other projects listed above for which the Agency has conducted EAs.		

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-15.5	Concerned that the federal Crown has no intention of establishing enforceable conditions to require mitigation and follow up measures (e.g., monitoring of adverse effects by marine shipping beyond the VFPA boundary) necessary for the protection of our Aboriginal fishing rights. Requested that the Agency provide Musqueam with the following additional information related to the assessment of marine shipping: • Information on the regulatory mechanism through which the federal Crown intends to set and enforce conditions related to the mitigation and/or accommodation of adverse cumulative effects related to marine shipping (beyond the VFPA boundary); and • Information on how the Crown intends to use the information collected through the Review Panel's assessment of "project associated" marine shipping (beyond the VFPA boundary) to consult with Musqueam.	07-Oct-2015, Letter to the CEA Agency	**11-May-2016, Letter from the CEA Agency:** "In your letter, you requested information on the regulatory mechanism through which the federal Crown intends to set and enforce conditions related to the mitigation and/or accommodation of adverse cumulative effects related to marine shipping (beyond the VFPA boundary). At this point in the process, the Government of Canada does not have enough information about the potential adverse cumulative effects related to marine shipping to determine what mitigation and/or accommodation may be needed. Once the Panel report is issued, the federal government will consider the conclusions and recommendations of the Panel and will determine what regulatory mechanisms exist at that point in time that can address any issues related to marine shipping associated with the Project. The Agency encourages the Musqueam to identify to the Panel any measures you think would mitigate any impacts to your rights, as the Panel will be responsible for assessment of environmental effects including potential cumulative effects. The terms of reference of the Panel direct it to include information submitted by Musqueam in its report. It is anticipated that the Panel will make conclusions on the potential environmental effects associated with marine shipping beyond VFPA's care and control. The Crown will also be monitoring and tracking all the information provided by Musqueam during the panel process. Once the Panel has issued its report, including information on project associated marine shipping, the Agency and other federal departments will consult with Musqueam on: • Whether the Panel report accurately reflects your concerns; • Whether you have any outstanding issues after looking at the proposed mitigation or accommodation in the Panel report; and • If there are outstanding concerns, what suggestions Musqueam has for addressing such issues. This information will be taken into account in determining the adequacy of consultation for the purposes of the Minister's EA decision and will involve the appropriate federal departments based on what you raise during the course of our dialogue on the topic of marine shipping. Should the Panel find significant adverse environmental effects, the Government of Canada will use the information provided by Indigenous groups involved in the process to help determine any actions necessary to mitigate those effects, where possible.		

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-15.6	Stated that Musqueam has yet to hear from the Proponent on Marine Shipping.	07-Oct-2015, Letter to the CEA Agency	**11-May-2016, Letter from the CEA Agency:** "The updated EIS Guidelines that were issued to VFPA on April 17, 2015 did not specifically require the proponent to consult with Musqueam with respect to marine shipping. However, following the issuance of the updated EIS Guidelines, [representatives of Musqueam] contacted the Agency and provided information about Musqueam's uses and concerns in the shipping lanes beyond the Musqueam statement of intent area and the area within the Musqueam Declaration. Following these discussions, the Agency wrote to Musqueam on April 24, 2015 and requested further information on your concerns. VFPA was copied on that letter to ensure they were aware that the Agency believed the Government has a legal duty to consult with Musqueam on potential impacts from marine shipping based on the new information Musqueam had provided. The Agency understands that VFPA offered to meet with Musqueam in June 2015 but was not successful in setting up a meeting. Following the review of the MSA submitted by VFPA, you wrote to the Agency noting that the information in the addendum does not address your concerns. As a result, the Agency sent a letter to VFPA on January 13, 2016, directing VFPA to gather and analyse the same types of information they had provided for the other Indigenous groups listed in the Updated EIS Guidelines. The Agency understands that VFPA and Musqueam are working together to produce this information and provide it to the Agency in summer 2016. The Agency also understands that VFPA and Musqueam have agreed on funding for Musqueam's input into the MSA information.	**Additional information provided by the VFPA:** The VFPA reached out to the Musqueam First Nation by way of letter of June 10, 2015 and again on December 4, 2015 to discuss marine shipping associated with the Project. On January 22, 2016, the VFPA met with Musqueam First Nation and provided information the marine shipping area, the marine shipping activity, and highlights from the MSA. On March 11, 2016, the VFPA offered funding for a Musqueam-led Marine Shipping Effects Assessment. The funding was accepted on March 14, 2016 and the report was submitted on May 24, 2016. On June 9, 2016, the VFPA wrote to Musqueam and provided draft a draft of the VFPA's understanding of existing conditions for Musqueam within the marine shipping area for your review and comment, including information pertaining to Current Use, marine commercial use, outdoor recreation, human health and archaeological and heritage resources. On July 7, 2016, the VFPA wrote to Musqueam responding to some of the concerns brought for in Musqueam's Marine Shipping Effects Assessment. On July 15, 2016, the VFPA received comments back from Musqueam on the draft materials and comments were considered in the AIMSA. On August 3, 2016, the VFPA provided the draft AIMSA for Musqueam's review, including sections pertaining to potential effects of Project-associated shipping, including potential residual effects and cumulative effects, and potential accidents or malfunctions associated with Project-related marine shipping. This document also includes sections relating to consultation occurring with Musqueam First Nation regarding marine shipping associated with the Project (Section 2.0 Aboriginal Groups Engagement and Consultation and Appendix 2-A Consultation Activities by Aboriginal Group), including issues and interests expressed in consultation (Section 2.4 Summary of Aboriginal Groups' Issues and Interests and Appendix 2-B Aboriginal Issues and Interests). On September 15, 2016, the VFPA received comments back from Musqueam on the AIMSA. On September 30, 2016, the VFPA wrote to Musqueam stating that Musqueam's comments have been included and incorporated in the AIMSA. The letter included a table showing how these comments were addressed. The VFPA stated that will also be submitted directly to the Review Panel and posted on the public registry. On October 4, 2016, the VFPA provided the AIMSA to the Review Panel.	
MFN-15.7	Requested that the Agency meet as soon as possible with Musqueam to ensure that we are consulted on the development of the scope of this study, in particular: 1. The spatial and temporal scope of the study; 2. The VCs and sub-VCs that are necessary to assess impacts that are directly related to	07-Oct-2015, Letter to the CEA Agency	**11-May-2016, Letter from the CEA Agency:** "The Government of Canada's preliminary depth of consultation assessment has Musqueam on the deep end of the consultation spectrum for consultation activities in the context of this EA process. The Agency encourages Musqueam to have the discussions requested by VFPA as described above in the context of the Agency's direction for VFPA to include the Musqueam in their assessment of environmental effects and impacts on rights in relation to marine shipping associated with the Project. If Musqueam are not satisfied with the		

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Musqueam's Aboriginal right to fish; 3. The population abundance thresholds directly linked to the "sufficiency of resources" that afford the opportunity for Musqueam members to be able to meaningfully exercise their fishing right, across a range of culturally significance fish species, with the traditional territory; 4. The list of other projects and activities that will be considered in the cumulative effects component of the study; and 5. The level of effort required by the Proponent to assess the impacts of marine shipping on the environment and on our Aboriginal rights.		information that VFPA includes in their response to the request, Musqueam are encouraged to present your own views on these topics to the Panel, once appointed. In particular the Crown would like to hear more from Musqueam on "The population abundance thresholds directly linked to the "sufficiency of resources" that afford the opportunity for Musqueam members to be able to meaningfully exercise their fishing right, across a range of culturally significance fish species, with the traditional territory", as Musqueam are best placed to articulate what you believe are the thresholds related to the exercise of your rights. Some key questions that would be helpful to provide information to VFPA or to the Panel in a written submission could include: • What do you mean by 'sufficiency of resources'?; • Do you have any preliminary thoughts on how much a given resource is sufficient?; • Which fish species are culturally significant to the Musqueam?; • What factors are the sufficiency of resources tied to – is it sufficient to meet the current populations need for food? Or is it sufficient for allowing continuity of cultural practices?; and • How would you determine if a resource is sufficient? How would you measure success?		
MFN-15.8	Stated that Musqueam has notified the Agency of the Crown's duty under Sparrow to justify any infringements on our fishing rights (for example, in our correspondence of October 15, 2013, February 11, 2014) and further has requested the Agency explain the process it intends to follow to justify infringements from the Project upon our rights. Requested that the Agency begin to work with Musqueam to develop the necessary infringement justification framework as soon as possible, to ensure that the framework is in place before the Review Panel releases its final report.	07-Oct-2015, Letter to the CEA Agency	**11-May-2016, Letter from the CEA Agency:** "The Crown is not in a position to discuss the infringement and justification of Musqueam rights at this juncture. The Agency has noted your position and acknowledges and respects the seriousness of your perspective. The Agency proposes that, at this point in the review process, the Crown and Musqueam engage in a discussion to identify the stages in the panel process where Musqueam can bring forward to the Panel its concerns and recommendations regarding methods by which potential impacts can be avoided or mitigated… Interwoven in the EA process is the Crown's duty to consult. The Crown is using the EA process to consult with Musqueam about potential adverse impacts from the Project and marine shipping associated with the Project on the exercise of your rights, to the extent possible. As such, the more information Musqueam is able to provide to the Panel, the better its report can reflect Musqueam's concerns, issues and proposed solutions. Once the Panel report is issued, the Crown will seek your views on whether Musqueam have any outstanding		

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			concerns regarding impacts. Further, there will be an opportunity for the Musqueam to provide input into the proposed environmental decision statement conditions which would form part of the Minister's EA decision statement, should the Project be allowed to proceed. This consultation on these draft potential conditions will further facilitate the ability of Musqueam to input into potential mitigation measures regarding your concerns. The Government of Canada will ensure, through the panel process and post-panel consultation activities, that there is a clear understanding of any potential impacts on the Musqueam's right to fish for food and ceremonial purposes, as established in the 1990 R. v. Sparrow decision before the Government of Canada makes a decision that would allow the Project to proceed…"		
MFN-15.9	Concerned that Project-related marine shipping will exacerbate existing levels of contamination of and mortality of coastal shellfish resources due to pollution.	24-May-2016, Musqueam First Nation Marine Shipping Effects Assessment	**24-May-2016:** Recorded comment for consideration by the Project team.	**Addressed in MSA, Section 7.3.3:** A change in water quality is not anticipated from ballast water discharges from vessels as these potential sources of contaminants are not expected to occur in the LSA as they are regulated (refer to Section 7.3.1). Bilge water must be treated to remove oils and grease prior to discharge as per regulatory requirements. Therefore, releases of contaminants or oily water from ballast or bilge water discharges are not anticipated to result from routine operations. **Additional Information provided by the VFPA:** As water quality changes are not anticipated, marine shipping associated with the Project is not expected to exacerbate existing levels of contamination of and mortality of coastal shellfish resources.	**MSA** 7.3.3 Quality of Preferred Current Use Resources 8.1 Marine Fish and Fish Habitat 9.5 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights
MFN-15.10	Concerned that marine shipping will exacerbate existing alienation from fishing, hunting, coastal plant, and shellfish resources caused by industrialization, settlement, and institutional policies imposed on Musqueam territory. Concerned about the exacerbation of the existing pattern of alienation from coastal plant and shellfish resources caused by industrialization and settlement in Musqueam territory. Concerned about the exacerbation of the existing pattern of alienation from fishing resources caused by industrialization, settlement, and institutional policies	24-May-2016, Musqueam First Nation Marine Shipping Effects Assessment 20-Jun-2016, Meeting 15-Nov-2017, Letter to Panel (CEAR Document #1098)	**24-May-2016:** Recorded comment for consideration by the Project team. **20-Jun-2016, Meeting:** Recorded comment for consideration by the Project team. **30-Sep-2016, Letter from the VFPA:** Responded that comments have been included and incorporated in the AIMSA, and will also be submitted directly to the Review Panel and posted on the public registry. Enclosed AIMSA Appendix 2-B showing the issues raised by Musqueam First Nation and the VFPA's responses.	**Addressed in AIMSA – MFN and TWN Section 7.3.5:** The potential effects of marine shipping associated with the Project within the marine shipping area on the Current Use, including intangible cultural heritage, of Musqueam First Nation may be summarised as follows: Negligible with respect to: • Change in access to preferred Current Use locations as a result of Project-associated ship wake; • Change in availability of preferred Current Use resources; • Change in quality of preferred Current Use resources; and • Change in quality of Current Use experience (except as specified below); and Minor with respect to: • Change in access to preferred Current Use locations as a result of Project-associated increases in ship pass-bys; and • Change in quality of Current Use experience associated with the Project-associated increases in ship pass-bys. As the implementation of mitigation measures referred to in AIMSA Section 7.4 are expected to effectively address potential incremental effects to Current Use by Musqueam First Nation as a result of Project-associated vessel transit activities within the marine shipping area,	**AIMSA – MFN and TWN** Appendix 2-B Aboriginal Issues and Interests 3.0 Human Health 3.1 Human Health Existing Conditions 3.2 Potential Interactions and Effects 7.0 Current Use of Lands and Resources for Traditional Purposes and Aboriginal and Treaty Rights 7.3.1 Access to Preferred Current Use Locations 7.3.2 Availability of Preferred Current Use Resources 7.3.5 Summary of Potential Effects on Current Use **Information Requests** Response to Sufficiency Information Request #6, 8 and 13 (IR10-6, -8, -13)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	imposed on Musqueam territory. Indicated that Musqueam members use or have used the Project footprint for their rights-based activities, including harvesting of salmon, crab, sturgeon, kelp, herring, clams, mussels, oysters, ducks, geese, pheasants, bulrush, and other resources. Concerned about the loss of access to preferred fishing and crab harvesting areas from the construction and physical occupation of the Project.			residual effects from those activities on Current Use are expected to be negligible. **Addressed in IR10-06 and IR10-13:** The VFPA's responses to IR10-06 and IR10-13, as requested by the Review Panel, provide additional information concerning the rationale for the current use effects assessment conclusions. **Addressed in IR10-08:** The VFPA's response to IR10-08, as requested by the Review Panel, further discusses potential changes in quality of the current use experience resulting from the proposed project.	
MFN-15.11	Concerned that that only a "qualitative Tier 1 study", largely based on previously developed, non-project specific studies, will be undertaken to address the effects of the proposed increase in marine shipping traffic through our territory. From Musqueam's perspective, the artificially limited scope of this study will preclude the Proponent from properly characterizing the current condition of, and the cumulative effects on, the very marine resources and access requirements that constitute the basis of our fishing rights. Requested that the Agency require the Proponent to undertake, at minimum, quantitative assessments in addition to existing studies for key indicator species and VC sub-species of concern, (i.e., a Tier 2 approach as noted in the EIGS) and that Musqueam be included in the development and implementation of the study. Stated that the Agency must direct the Proponent to properly assess, in consultation with Musqueam, the cumulative effects related	07-Oct-2015, Letter to the CEA Agency 16-Dec-2015, Letter to Panel (CEAR Document #368)	**11-May-2016, Letter from the CEA Agency:** "If Musqueam has suggestions of which key indicator species would be appropriate in the context of assessing impacts on Musqueam's interests, please provide that information to VFPA and the Panel. The Government relies on the Panel to conduct the EA of the potential effects of the Project, which is why the Agency is encouraging you, and all other participants, to participate in the review panel process and notify the Panel if you feel technical information is lacking in the EIS."	**Addressed in the *Updated EIS Guidelines* Section 17.0:** It is likely that a Tier 1 approach (Qualitative; description based on expert opinion and traditional and local knowledge) will be an appropriate level of detail in most cases. For select environmental effects and locations where there may be a higher risk of environmental effects, a Tier 2 approach (Semiquantitative; measured site-specific data and existing site information) would likely be an appropriate level of detail.	***Updated Guidelines for the Preparation of an Environmental Impact Statement* (CEAR Document #177)** 17.0 Marine Shipping

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	to all shipping activities throughout Musqueam harvesting areas. Given the declining trajectory of marine species abundance within our traditional territory, the Agency must directly require the Proponent to undertake, at minimum, semi-quantitative assessments in addition to existing studies for key indicator species and VC sub-species of concern identified by Musqueam, (i.e., a Tier 2 approach as noted in the E/5 Guidelines for "select environmental effects and locations where there may be a higher risk of environmental effects") and to include Musqueam the development and implementation of such studies.				
MFN-15.12	Concerned that the federal approach being taken on a project-by-project basis will not properly address cumulative effects on the environment and on our fishing right.	07-Oct-2015, Letter to the CEA Agency	**11-May-2016: Letter from the CEA Agency:** "The Crown considers cumulative effects on the exercise of rights when assessing the potential severity of the impact from proposed projects on rights. The criteria used includes historical context. The Agency's handout from the November 2014 meeting (http://www.ceaa-acee.gc.ca/050/document-eng.cfm?document=100180) includes a detailed explanation of what the Crown considers in the assessment of impacts on rights. Below is an excerpt of the relevant section: "When the federal Crown assesses the seriousness of potential adverse impacts on the exercise of Aboriginal and Treaty rights, various considerations will guide federal officials conducting the initial assessment. These may include the following factors: 1. The certainty of adverse impacts - what is the likelihood that the impact will occur? 2. The magnitude of the adverse impacts - what is the nature and degree of the impact? 3. The duration and frequency of the adverse impacts - how often will the impact occur? Will these occurrences be short or long term? 4. Reversibility - is the adverse impact reversible (are impacts of a permanent or temporary nature?) 5. The extent of the adverse impacts - will these be localized in nature or broader? How does the		

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			geographic extent of the adverse impact relate to the geographic extent of the right, as practiced? 6. Context- Aboriginal perspective on the importance, uniqueness or value of a particular use, area, activity or species, including consideration of any past potential impacts. 7. Historical context - are there past impacts to Aboriginal rights that would help in understanding potential impacts? [emphasis added] 8. Accommodation- are there any accommodation measures proposed that would reduce the seriousness of the impact on the exercise of rights? In addition, federal officials may differentiate between high, medium and low impacts as follows: 1. High impact - ability to exercise that right has been significantly diminished 2. Moderate impact - ability to exercise that right has been diminished or disrupted 3. Low impact - ability to exercise the right is minimally disrupted The federal Crown is open to considering other criteria and concepts from Aboriginal groups, as the federal Crown recognizes that each Aboriginal group is unique and the circumstances which may cause a serious impact on their Aboriginal or Treaty rights needs to be examined on a case-by-case basis. Specific information from Aboriginal groups such as baseline data, benchmarks and related measurements that relate to each Aboriginal group's rights, culture and well-being are important and can aid the federal Crown's understanding of the seriousness of potential adverse impact on Aboriginal or Treaty rights." The Agency encourages Musqueam to explain to VFPA and the Panel any existing impacts from development on your ability to exercise your rights and any proposed mitigation you may have relating to the Project and marine shipping associated with the Project based on your experience with other projects in your territory."		
MFN-15.13	Requested that the federal government work with Musqueam to develop a full-scale cumulative effects study on marine shipping with a particular focus on the risk that any additional shipping poses to the sufficiency of resources that are at root, the essential basis that affords	07-Oct-2015, Letter to the CEA Agency 16-Oct-2015, Meeting 16-Dec-2015, Letter to Panel (CEAR Document #368)	**16-Oct-2015, Meeting:** Responded that it is not something that can be provided as part of the EA but perhaps could be part of a Port-wide study. Responded that it would consider funding a cumulative effects study as part of a benefits package for Musqueam.	**Additional information provided by the VFPA:** The methodological approach used in the EIS and MSA are consistent with those in the Operational Policy Statement *Assessing Cumulative Environmental Effects Under the CEAA, 2012* issued by the CEA Agency.	**CEA Agency. 2013. Operational Policy Statement: Assessing Cumulative Environmental Effects under the *CEAA, 2012*** Available at https://www.ceaa-acee.gc.ca/default.asp?lang=En&n=1DA9E048-1. Accessed March 2014.

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	any meaningful opportunity to our members to exercise our Aboriginal rights. Musqueam proposes to lead such a cumulative effects study. Requested funding for a cumulative effects study. Reiterated request that the Crown either direct Proponents to undertake proper cumulative effects assessments, or as an alternative, the federal government itself work with Musqueam to develop a full-scale cumulative effects study on marine shipping with a particular focus on the risk that any additional shipping poses to the sufficiency of resources that are, at root, the essential basis that affords any meaningful opportunity to our members to exercise our Aboriginal rights.		**11-May-2016, Letter from the CEA Agency:** "Thank you for outlining your proposal to develop and lead a full-scale cumulative effects study on marine shipping with a particular focus on the risk that any additional shipping poses to the sufficiency of resources that afford a meaningful opportunity to your members to exercise your Aboriginal rights. The Agency has shared it with other members of the federal review team on this Project. We have some further questions of Musqueam to better understand what it is you are proposing: 1. What is the envisioned outcome of such a study? How would the outcome of the study be applied to current and/or future projects or planning? 2. Is the focus on marine shipping related to projects, or, all types of marine traffic? 3. Based on your letter, it appears your key concern is the sufficiency of resources, however, in our meetings and in other letters, Musqueam has also raised access and safety concerns with respect to the interface between marine shipping and the exercise of Musqueam rights. Would you see a cumulative effects study on marine shipping focusing solely on sufficiency of resources or would you want something that relates to how and where rights are practiced as well? 4. Would you propose to involve the federal and provincial government? 5. Would you propose to involve other Nations, and if so, who and how? 6. Would you propose to involve industry and VFPA, and if so, how? 7. What would be the temporal and geographic scope for such a study? 8. Do you envision this study as collecting baseline information and what timeframe would you consider appropriate? 9. What is your estimate for how long a study of this type would take to complete?"		
MFN-15.14	Stated that the Draft Addendum is not only incomplete, but wholly missing any substantive information related to Musqueam and the effects of marine shipping on our rights-based fishery and related interests.	16-Dec-2015, Letter to Panel (CEAR Document #368)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in AIMSA – MFN and TWN:** On October 4, 2016, the VFPA submitted supplementary information related to the additional study and engagement that was undertaken regarding the MSA, per the CEA Agency's letter from January 13, 2016. The additional information summarises potential impacts of marine shipping associated with the Project as it relates to the exercise of potential or established Aboriginal or Treaty rights of the Musqueam First Nation (and Tsleil-Waututh Nation). **AIMSA – MFN and TWN Section 1.0:** The purpose of this document, the AIMSA, is to provide supplementary information to the EIS, specifically the MSA. The information included here is based on additional information (from either pre-existing sources,	**AIMSA – MFN and TWN** 1.0 Purpose of the Additional Information to the Marine Shipping Addendum

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				or provided directly to the VFPA in a new study) pertaining to Musqueam First Nation and Tsleil-Waututh Nation and the findings of the MSA.	
MFN-15.15	Stated that Musqueam is at a loss to understand how the Agency and the Proponent (itself a Crown entity) both appear to have chosen to ignore our Musqueam Fishing Area, set out in our Comprehensive Fisheries Agreement ("CFA") with Fisheries and Oceans Canada ("DFO"), dating back to 2001 (see attached). Stated that any proper evaluation of these maps would immediately make apparent that the proposed marine shipping route associated with the Project literally bisects the Musqueam Fishing Area as well as having the potential to impact Musqueam harvesting within the Salish Sea. Musqueam has exercised its rights to harvest fish in the Salish Sea for millennia.	16-Dec-2015, Letter to Panel (CEAR Document #368)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 21.5.2.2 and AIMSA – MFN and TWN Section 4.1.1.1:** The VFPA have acknowledged the Musqueam CFA in the EIS and AIMSA. As indicated in EIS Section 21.5.2.2, Musqueam First Nation has an economic opportunity fishery via a communal licence issued by DFO under its comprehensive fisheries agreement for Fraser River sockeye salmon, Fraser River pink salmon and Fraser River chum salmon. As indicated in EIS Section 21.5.2.2, the authorised fishing area is defined in the communal licence but may include areas from the southern end of Bowen Island to the LAA, as well as the Fraser River up to Port Mann Bridge. The harvesting area displacement effect of the Project on commercial salmon harvesters is therefore considered to be negligible.	**EIS** 21.0 Marine Commercial Use 21.5 Existing Conditions 21.5.2.2 Marine Fish Harvesting **AIMSA – MFN and TWN** 4.1 Musqueam First Nation 4.1.1.1 Aboriginal Marine Fish and Seafood Harvesting
MFN-15.16	Stated that the Crown owes a much greater duty to consult and accommodate on impacts to Musqueam than other First Nations listed.	16-Dec-2015, Letter to Panel (CEAR Document #368)	The VFPA understands that this comment is directed to the Panel.		

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-16.17	Stated that the Agency must declare that the Draft Addendum is incomplete due to the omission of an assessment of adverse effects of marine shipping on Musqueam CULRTP and rights-based marine harvesting activities. Stated that the Agency must direct the Proponent to consult with Musqueam on the scope of the marine shipping study, in particular: a. The spatial and temporal scope of the study; b. The VCs and sub-VCs that are necessary to assess impacts that are directly related to Musqueam's Aboriginal right to fish; c. The population abundance thresholds directly linked to the "sufficiency of resources" that afford the opportunity for Musqueam members to be able to meaningfully exercise their fishing right, across a range of culturally significance fish species, with the traditional territory; d. The list of other projects and activities that will be considered in the cumulative effects component of the study; and e. The level of effort required by the Proponent to assess the impacts of marine shipping on the environment and on our Aboriginal rights.	16-Dec-2015, Letter to Panel (CEAR Document #368)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in AIMSA – MFN and TWN:** On October 4, 2016, the VFPA submitted supplementary information related to the additional study and engagement that was undertaken regarding the MSA, per the CEA Agency's letter from January 13, 2016 (CEAR Document #383). The additional information summarises potential impacts of marine shipping associated with the Project as it relates to the exercise of potential or established Aboriginal or Treaty rights of the Musqueam First Nation (and Tsleil-Waututh Nation). **Addressed in AIMSA – MFN and TWN Section 1.0:** The purpose of this document, the AIMSA, is to provide supplementary information to the EIS, specifically the MSA. The information included here is based on additional information (from either pre-existing sources, or provided directly to the VFPA in a new study) pertaining to Musqueam First Nation and Tsleil-Waututh Nation and the findings of the MSA. **Addressed in AIMSA – MFN and TWN Section 2.0:** AIMSA Section 2.0 describes the engagement process undertaken by the VFPA with Musqueam First Nation and Tsleil-Waututh Nation in support of the document. Details regarding the engagement and consultation program with Indigenous groups initially consulted in preparation of the MSA are provided in MSA Section 5.0.	**AIMSA – MFN and TWN** 1.0 Purpose of the Additional Information to the Marine Shipping Addendum From the CEA Agency to the VFPA re: Additional Instructions on Aboriginal Groups (CEAR Document #383)
MFN-16.18	Stated that the Agency must direct the Proponent—consistent with direction provided by the Agency to the Proponent for assessing cumulative effects related to the Project as a whole—to consult with Musqueam in order to obtain qualitatively	16-Dec-2015, Letter to Panel (CEAR Document #368)	The VFPA has reviewed this letter and provides the following additional information	**Addressed in AIMSA – MFN and TWN Appendix 2-B (#34):** Consistent with the methods applied in the assessments of potential effects on VCs, the Current Use assessment did not undertake a cumulative effects assessment because the Current Use assessment predicts that there will be no measurable residual effects on Current Use as a result of marine shipping associated with the Project after the implementation of suggested mitigation measures. The VFPA is confident in the effectiveness of the suggested mitigation measures described in	**AIMSA – MFN and TWN** Appendix 2-B Aboriginal Issues and Interests – Musqueam First Nation and Tsleil-Waututh Nation 7.4 Suggested Mitigation Measures

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	known trends in the condition of the valued component (e.g., the declining trajectory of available resources to support Musqueam marine harvesting) through Musqueam Aboriginal traditional knowledge, historic data or any other sources and describe how past activities have affected the conditions of the valued component.			the AIMSA, but has noted Musqueam's views on these suggested measures in AIMSA Section 7.4. These measures are the same as those described in the MSA.	
MFN-16.19	Stated that the Agency must direct the Proponent to consult with Musqueam on potential adverse effects of marine shipping on Musqueam marine harvesting, and in addition, on the suitability of potential forms of mitigation, the likely degree of effectiveness of mitigation and the reasons for determining if the measures reduce the significance of the effect, the likelihood of residual effects after mitigation, and other mitigation measures that were considered but rejected and the reasons for their rejection.	16-Dec-2015, Letter to Panel (CEAR Document #368)	The VFPA has reviewed this letter and provides the following additional information	**Addressed in Response to IR-15.07.31-12:** The VFPA's Response to IR-15.07.31-12, presents a description of how each of the mitigation measures proposed in the EIS, is intended to reduce the significance of the potential effect. Also, the response presents the anticipated effectiveness of each mitigation measure, as well as the risks (if any) to the environment should the mitigation not be effective. **Addressed in AIMSA – MFN and TWN Section 7.4:** Discusses MSA-related suggested mitigation measures related to Current Use and Rights. The measures are: • Consultation on the development of a potential marine shipping activities communication plan that would provide affected Indigenous groups with real-time information regarding the movement of Project-associated shipping traffic through the marine shipping area, including: • The estimated time of arrival of Project-associated container ships and their expected duration of use of the shipping lanes for inbound and outbound movements; • Circumstances outside normal operations that might affect the expected frequency or concentration of Project-associated vessel traffic along the shipping routes (e.g., clearing backlogs in shipping traffic due to storms requiring ships to temporarily anchor before proceeding); and • Consultation with the affected Indigenous groups to identify measures that would reduce the impact of the international shipping lanes to fishing by Indigenous groups. Musqueam First Nation has indicated that the above-noted mitigation measures, in Musqueam's view, "do not in themselves provide a measurable form of mitigation" (Musqueam First Nation 2016b). Musqueam have made no specific suggestions to the VFPA regarding mitigation measures for potential effects associated with marine shipping associated with the Project. **Additional information provided by the VFPA:** The VFPA remains open to suggestions regarding potential mitigation measures. **Addressed in Response to IR7-34:** As noted in the VFPA's response to IR7-34, mitigation measures currently undergoing consultation and evaluation include: • Crab Management Area re-selection opportunity; • Adjustment of proposed navigational closure area expansion with consideration of commercial harvesting during Project operation;	**AIMSA – MFN and TWN** 7.4 Suggested Mitigation Measures **Information Requests** Response to Information Request #12 (IR-15.07.31-12 of CEAR Document #314) Response to Sufficiency Information Request #34 (IR7-34 of CEAR Document #1172)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				• Adjustment of the proposed navigational closure area expansion with consideration of Indigenous harvesting during operation; • Navigational Limited Access Fishing Area (multi-user system during operation); and • Financial compensation. The evaluation of additional mitigation measures is being informed by consultation with commercial crab harvesters (including the Area I Crab Fisherman Association), Indigenous groups, DFO, and may include other relevant regulatory agencies regarding their specific interests and concerns. Evaluation of technical and economic feasibility of the suggested measures is currently underway to inform this consultation. Technical feasibility considers the following: • Availability, applicability, and effectiveness of the specific technology; • Fit with local site characteristics, Project design, construction schedule; • Applicable regulatory frameworks; and • Whether implementation is within the VFPA's jurisdiction. Economic feasibility considers the following: • Scope of the Project design (Project re-design not required); • Construction schedule (Project construction delay not required); and • Total cost of implementation of each measure during construction and/or operation. The VFPA remains committed to working with Musqueam to build a productive and positive working relationship and welcomes further discussion with Musqueam with respect to this matter.	
MFN-16.20	Stated that given that the Draft Addendum contains no reference to Musqueam CULRTP or rights-based harvesting (especially Sections 5.0 and 9.5, and related appendices) the Agency must provide Musqueam with, at minimum, a 21-day comment period to review and submit comments on the completeness of the revised version of the Draft Addendum once it has been resubmitted to the Agency for consideration.	16-Dec-2015, Letter to Panel (CEAR Document #368)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in AIMSA – MFN and TWN Section 7.2.1:** AIMSA Section 7.4 discusses rights-based harvesting related to Current Use and Rights.	**AIMSA – MFN and TWN** 7.2.1 Musqueam First Nation
MFN-16.21	Stated that the conclusion in the MSA that "Project-associated shipping is not expected to measurably affect the existing quality of Current Use experience for either Musqueam First Nation or Tsleil-Waututh Nation within the Marine Shipping Area through changes to noise, light or air emissions, and	15-Sep-2016, Email	**30-Sep-2016, Letter from the VFPA:** Responded that comments have been included and incorporated in the AIMSA, and will also be submitted directly to the Review Panel and posted on the public registry. Enclosed an excerpt from AIMSA Appendix 2-B showing your September 15, 2016 comments on the final draft AIMSA and the VFPA's response to those comments.	**Addressed in AIMSA MFN and TWN Appendix 2-B (#28):** "By way of this comment, the VFPA notifies the CEA Agency and the Review Panel of the views of Musqueam First Nation on this assessment conclusion. The VFPA notes that this concern is specific to marine shipping at Roberts Bank, which was assessed as part of the EIS. The AIMSA considers effects from marine shipping occurring in a separate area, the marine shipping area as defined in Figure 1-1 of the MSA."	**MSA** Figure 1-1 2.0 Geographic Setting **AIMSA – MFN and TWN** Appendix 2-B Aboriginal Issues and Interests 7.0 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights 7.3.4 Quality of Current Use Experience

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	increased statistical risk to safety on the water" is unsupportable. Stated that the evidence provided by Musqueam, including in the Musqueam Marine Shipping Effects Assessment demonstrate that the perceived risks associated with heightened marine shipping results in avoidance due to perceived risk and/or contamination (risk and/or contamination, and/or general disturbance and diminishment of harvesting opportunities.				
MFN-16.22	Concerned that Project-related marine shipping, and related restrictions/ regulations, will lead to disruptions to fishing activities, increased avoidance or loss of fishing grounds, resulting in decreased access to seafood obtained from fishing. Concerned about the loss of fishing grounds and disruptions to fishing activities due to the presence of marine traffic and restriction and regulations to access.	24-May-2016, Musqueam First Nation Marine Shipping Effects Assessment 20-Jun-2016, Meeting 15-Sep-2016, Email 15-Nov-2017, Letter to Panel (CEAR Document #1098)	**24-May-2016:** Recorded comment for consideration by the Project team. **20-Jun-2016, Meeting:** Recorded comment for consideration by the Project team. **30-Sep-2016, Letter from the VFPA:** Responded that comments have been included and incorporated in the AIMSA, and will also be submitted directly to the Review Panel and posted on the public registry. Enclosed an excerpt from AIMSA Appendix 2-B showing your September 15, 2016 comments on the final draft AIMSA and the VFPA's response to those comments.	**Addressed in AIMSA – MFN and TWN Appendix 2-B (#22):** The assessment of Current Use includes an assessment of potential effects on access to Current Use locations. Project-associated marine shipping will take place within existing international shipping lanes; no additional restrictions or regulations are anticipated.	**MSA** 9.5 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights 9.5.5 Potential Interactions and Effects of Vessel Transit on Current Use **AIMSA – MFN and TWN** Appendix 2-B Aboriginal Issues and Interests 7.0 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights 7.3.1 Access to Preferred Current Use Locations
MFN-16.23	Concerned that pollution from Project-related marine shipping will lead to avoidance of coastal harvesting activities, and in turn, loss and disruption of historical, social and cultural values.	24-May-2016, Musqueam First Nation Marine Shipping Effects Assessment 20-Jun-2016, Meeting 15-Sep-2016, Email	**30-Sep-2016, Letter from the VFPA:** Responded that comments have been included and incorporated in the AIMSA, and will also be submitted directly to the Review Panel and posted on the public registry. Enclosed an excerpt from AIMSA Appendix 2-B showing your September 15, 2016 comments on the final draft AIMSA and the VFPA's response to those comments.	**Addressed in AIMSA – MFN and TWN Appendix 2-B (#23):** The assessment of human health (in the MSA and in the AIMSA) assesses the potential effects of Project associated marine shipping on contamination in marine edible resources. The assessment of Current Use (in the MSA and the AIMSA) considers potential avoidance of harvesting resources that may be contaminated through the quality of preferred Current Use resources indicator. The assessment also considers potential effects on cultural practices or heritage (i.e., historical, social, and cultural values) associated with Current Use activities that may be avoided.	**MSA** 9.1 Human Health 9.1.5.1 Negligible Effects, Indirect Exposure to Contaminants in Marine Edible Resources 9.5 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights 9.5.5 Potential Interactions and Effects of Vessel Transit on Current Use **AIMSA – MFN and TWN** Appendix 2-B Aboriginal Issues and Interests 3.0 Human Health 3.2.2 Negligible Effects Related to Contamination in Edible Marine Resources

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
					7.0 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights 7.3 Potential Interactions and Effects on Current Use 7.8 Potential Impacts on Asserted or Established Aboriginal and Treaty Rights
MFN-16.24	Concerned about the greater quantities of large ships traveling the Fraser River and Salish Sea, which have become constant objective hazards and obstructions to their fishing activities. Opportunities to fish may be also lost to larger ships when Musqueam fishing is obligated to stop to avoid collisions.	15-Nov-2017, Letter to Panel (CEAR Document #1098)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in Responses to IR10-06 and IR10-13:** The VFPA's responses to IR10-06 and IR10-13, as requested by the Review Panel, provide additional information concerning the rationale for the current use effects assessment conclusions.	**Information Requests** Response to Sufficiency Information Request #06 (IR10-06) Response to Sufficiency Information Request #13 (IR10-13)
MFN-16.25	Concerned that shipping activities due to the Project would scare fish away and disrupt this key part of salmon migration, with potential effects further upriver in areas that are heavily used by Musqueam fishers. Crabs were also noted as vulnerable to shipping activity deriving from the Project.	15-Nov-2017, Letter to Panel (CEAR Document #1098)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in MSA Section 8.1:** Discusses potential effect to marine fish related to Marine Shipping associated with the Project. An assessment was undertaken to evaluate the potential effects of Project-associated marine shipping on marine fish and fish habitat (including marine vegetation and marine invertebrates) within the marine shipping area and located within the Salish Sea. Potential effects of vessel wake-generated waves on marine fish and fish habitat were characterised as negligible, because only 2% of coastline in the LAA is within the wake-related zone of influence, and because wake-generated wave heights at shorelines are predicted to be well within the range of natural wave conditions. Fish and fish habitat are already adapted to the natural conditions; therefore, any wake-related influences would not be distinguishable from existing conditions. Similarly, potential effects of underwater noise were also considered to be negligible because noise associated with Project-associated marine vessel activity and future cumulative shipping activities would not exceed injury thresholds for fish species or the Pacific salmon species behavioural threshold. Further, while noise-induced behavioural changes are possible for Pacific herring, potential effects would be localised to within 20 m of a container ship and of short duration (as the ship passes by) and are therefore not anticipated to affect the integrity of populations within the LAA.	**MSA** 8.1 Marine Fish
MFN-16.26	Stated that Musqueam has been excluded from the scope of the marine shipping study. Stated that more one-on-one consultation on the effects of Marine Shipping on Musqueam's rights and with respect to cumulative effects is needed. Criticised that the EIS was deemed complete before MFN	22-Jan-2016, Meeting 20-Jun-2016, Meeting	**22-Jan-2016, Meeting:** Summarised the timeline for marine shipping. Stated that following the CEA Agency letter to Musqueam regarding marine shipping, the VFPA sent Musqueam a request for information related to marine shipping and offer of funding that was accepted by Musqueam. The VFPA didn't receive direction from CEA Agency, but came to Musqueam because thought there may be a concern. The VFPA understands Musqueam's concern and will include them in future consultation.	**Addressed in AIMSA – MFN and TWN Appendix 2-B (#1):** An addendum to the EIS (the AIMSA) has been prepared to supplement the MSA with information provided by and pertaining to Musqueam First Nation's interest in the marine shipping area. Ongoing and planned consultation with Musqueam First Nation is summarised in AIMSA Section 2.0. **Addressed in AIMISA – MFN and TWN Appendix 2-B (#5):** The determination of the completeness of the EIS was made by the CEA Agency. The process for review of additional information, is made by the CEA Agency and the Review Panel. By way of this comment, the VFPA notifies the CEA Agency and the Review Panel of these concerns.	**AIMSA – MFN and TWN** 2.0 Aboriginal Groups Engagement and Consultation Appendix 2-B Aboriginal Issues and Interests

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	input regarding marine shipping had been submitted. Concerned that the MSA including MFN's material will not be subject to the same review process as the documents submitted previously.		**20-Jun-2016, Meeting:** Recorded comment for consideration by the Project team. **30-Sep-2016, Letter from the VFPA:** Responded that comments have been included and incorporated in the AIMSA, and will also be submitted directly to the Review Panel and posted on the public registry. Enclosed AIMSA Appendix 2-B showing the issues raised by Musqueam First Nation and the VFPA's responses.		
MFN-16.27	Concerned that Project-related marine shipping will lead to loss of waterfowl habitat from wakes generated by marine shipping. Concerned about the loss of waterfowl habitat from wakes generated by marine shipping.	24-May-2016, Musqueam First Nation Marine Shipping Effects Assessment 20-Jun-2016, Meeting 15-Nov-2017, Letter to Panel (CEAR Document #1098)	**24-May-2016:** Recorded comment for consideration by the Project team. **20-Jun-2016, Meeting:** Recorded comment for consideration by the Project team. **30-Sep-2016, Letter from the VFPA:** Responded that comments have been included and incorporated in the AIMSA, and will also be submitted directly to the Review Panel and posted on the public registry. Enclosed AIMSA Appendix 2-B showing the issues raised by Musqueam First Nation and the VFPA's responses.	**Addressed in AIMSA - MFN and TWN Appendix 2-B (#14):** The assessment of Project-associated marine shipping effects on the wave environment, in the MSA, evaluates potential effects of waves from ship wake, and this assessment informs the assessment of potential effects on fish and fish habitat, including marine vegetation. The assessment of marine birds (in the MSA) includes consideration of potential effects of ship wake on the habitat of marine birds. Potential effects of vessel wake-generated waves on marine birds were characterised as negligible, because wake-generated wave heights are predicted to be well within the range of natural wave conditions. Birds and bird habitat are already adapted to the natural wave conditions; therefore, any wake-related influences would not be distinguishable from existing conditions The assessment of Current Use in the AIMSA includes a description of the concern of Musqueam First Nation for effects on birds.	**MSA** 7.2 Wave Environment 8.1 Marine Fish and Fish Habitat 8.1.6.1. Negligible Effects, Vessel Wake 8.3 Marine Birds 8.3.6 Potential Interacts and Effects **AIMSA – MFN and TWN** Appendix 2-B Aboriginal Issues and Interests 7.0 Current Use of Lands and Resources for Traditional Purposes and Aboriginal and Treaty Rights 7.3.2 Availability of Preferred Current Use Resources

Table 16: Marine Vegetation – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-16.1	Concerned about effects to upland vegetation and to Musqueam's right to hunt and harvest terrestrial plants. Requested the study that supports the statement that upland areas will not be affected by the Project.	18-Oct-2013, Meeting 19-Nov-2014, Health & Aboriginal Rights Workshop - MFN	**18-Oct-2013, Meeting:** Recorded comment for consideration by the Project team. **19-Nov-2014, Workshop:** Stated that upland vegetation is not expected to be affected by the Project. If Musqueam has information regarding potential effects to other resources, that information will be considered. All studies in the EIS are available. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in EIS Appendix 7.2-B (#180):** Since the Project area does not extend into the upland area eastward of the Roberts Bank causeway, with the exception of a 450 m narrow strip (approximately 1 ha) on the existing British Columbia Railway (BCR) right-of-way for tie-in purposes to the existing mainline rail network via the Roberts Bank Rail Corridor, there is little potential for Project-related effects to terrestrial plant and wildlife species (i.e., coastal black tail deer, squirrel, and berries and medicinal plants). Potential effects to marine fish and coastal birds are Addressed in EIS, as are potential effects on the quality of experience of carrying out traditional use in upland areas, based in part on the findings of the light, noise and vibration, and human health assessments. Based in part on the findings of the assessment of marine biophysical VCs, potential Project-related effects on resource harvesting of traditional species are assessed in EIS Section 32.0.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Lands and Resources for Traditional Purposes 32.3 Potential Adverse Impacts on Aboriginal and Treaty Rights and Related Interests Analysis
MFN-16.2	Concerned about pollution from the Project and its impacts on vegetation. Concerned about potential effects of the Terminal on shoreline plants, noting that when cattails are cut from polluted areas they have a foul odour. Noted that harvesting areas must also be clean for medicinal plants to have potency. Concerned that the medicinal plants that remain in the vicinity of the proposed Project have been rendered unusable to some by pollution and disturbance from marine and terrestrial traffic, as well as the Westshore terminal	08-Jul-2014, Contemporary Musqueam Use of the South Fraser Delta Report 15-Nov-2017, Letter to Panel (CEAR Document #1098)	**08-Jul-2014:** Recorded comment for consideration by the Project team.	**Addressed in EIS Section 9.7:** Project construction and operation activities are not expected to alter water contaminant or nutrient levels, pH, dissolved oxygen, or temperature. **Addressed in EIS Section 11.6.2.1:** Potential operation-phase changes from wastewater (sewage) and stormwater discharges, and discharges from ships (bilge water and ballast water) are not expected to affect marine vegetation due to the distant location of discharges into subtidal waters, the incorporation of management and treatment measures described in EIS Section 4.2.1, and the implementation of regulatory requirements and guidelines (refer to EIS Section 9.7.8 for more information). **Addressed in MSA Section 7.3:** Reports that a change in marine water quality is not anticipated as a result of Project-associated vessel transit activities within the marine shipping area, as Project-associated marine vessels are prevented from discharging bilge or ballast water by domestic and international regulations. By extension, a change in the quality of marine resources would also not be expected as a result of water-borne pollution from vessel discharges. **Addressed in EIS Section 32.2.7.3:** In combination with the measures to address or reduce Project-related effects on Current Use access and availability of preferred Current Use resources, the measures outlined in EIS Section 27.0 to address traditional food avoidance due to perceived contamination concerns are also expected to be effective in mitigating adverse effects on Current Use that may stem from Project-related contamination concerns. The residual effect on the quality of preferred Current Use resources as a result of the Project is therefore predicted to be negligible	**EIS** 4.2.1 Project Description, Marine Terminal 9.7.8 Marine Water Quality, Future Conditions with the Project 11.6.2.1 Changes in Water Quality 27.0 Human Health 32.2.7.3 Mitigation Measure #3: Changes in Quality of Preferred Current Use Resources **MSA** 7.3 Marine Water Quality 7.3.3 Quality of Preferred Current Use Resources
MFN-16.3	Concerned that Project-related marine shipping will exacerbate existing levels of contamination of and mortality of coastal plant resources due to pollution.	24-May-2016, Musqueam First Nation Marine Shipping Effects Assessment	**24-May-2016:** Recorded comment for consideration by the Project team.	**Addressed in MSA Section 7.3:** Reports that a change in marine water quality is not anticipated as a result of Project-associated vessel transit activities within the marine shipping area, as Project-associated marine vessels are prevented from discharging bilge or ballast water by domestic and international regulations. By extension, a change in the quality of marine resources would also not be expected as a result of water-borne pollution from vessel discharges.	**MSA** 7.3 Water Quality 8.1 Marine Fish and Fish Habitat 8.1.5.3 Intertidal Habitat 8.1.6 Potential Interactions and Effects

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Concerned that Project-related marine shipping will lead to loss of valued habitat for fishing resources due to, noise, movement and pollution. Concerned about the increased contamination, loss of viable habitat, and mortality rates of coastal plant and shellfish resources due to pollution generated from marine shipping.	15-Nov-2017, Letter to Panel (CEAR Document #1098)		**Addressed in MSA Section 8.1:** An assessment was undertaken to evaluate the potential effects of Project-associated marine shipping on marine fish and fish habitat (including marine vegetation and marine invertebrates) within the marine shipping area. Potential effects of vessel wake-generated waves on marine fish and fish habitat were characterised as negligible, because only 2% of coastline in the LAA is within the wake-related zone of influence, and because wake-generated wave heights at shorelines are predicted to be well within the range of natural wave conditions. Fish and fish habitat are already adapted to the natural conditions; therefore, any wake-related influences would not be distinguishable from existing conditions. Similarly, potential effects of underwater noise were also considered to be negligible because noise associated with Project-associated marine vessel activity and future cumulative shipping activities would not exceed injury thresholds for fish species or the Pacific salmon species behavioural threshold. Further, while noise-induced behavioural changes are possible for Pacific herring, potential effects would be localised to within 20m of a container ship and of short duration (as the ship passes by) and are therefore not anticipated to affect the integrity of populations within the LAA.	9.5 Current Use of Lands and Resources for Traditional Purposes and Aboriginal and Treaty Rights 10.0 Potential Accidents or Malfunctions 10.5.6 Marine Fish and Fish Habitat
MFN-16.4	Concerned that traditional plants are not accessible due to habitat changes and stressed the importance of creating harvestable areas with cattails, lomatium and other plants. Noted patch of lomatium along the dike from Brunswick Point to Tsawwassen, a species critical for cultural continuity.	16-Jun-2017, Meeting with Administrative Staff	**16-Jun-2017, Meeting:** Recorded comment for consideration by the Project team. Noted approach taken by VFPA HEP for inclusion of culturally significant and harvestable plants identified as important by First Nations.	**Additional information provided by the VFPA:** Beyond the offsetting measures suggested in the EIS, the VFPA encourages Indigenous groups participating in the EA to suggest specific offsetting measures for consideration. **Addressed in EIS Section 32.2.4.2 and response to IR10-05:** Potential effects of the Project on Current Use, including *Lomatium* (q̓əχmin), were assessed in EIS Section 32.2.4.2 and further discussed in IR10-05. Brunswick Point, at the northeastern aspect of the marine vegetation LAA, has been identified by Indigenous groups as an important area for harvesting aquatic and terrestrial plants for food, medicinal, ceremonial, and manufacturing purposes. Of these, intertidal species include cattail, tule (hard-stemmed bulrush), and grasses (possibly canary grass, used for weavings, basketry, and tumplines). As outlined in EIS Section 11.6.3.2 (Marine Vegetation), intertidal marsh productivity is expected to increase with the Project, as predicted changes in coastal geomorphology will make existing habitats and growing conditions more suitable over time. By extension, EIS Section 32.3.2 concluded that the Project is not expected to impact the ability of Indigenous groups to exercise potential or established Aboriginal or treaty rights to gather plants. With regards to *Lomatium* (bare-stem desert parsley), specifically, EIS Section 32.2.4.2 notes the plant was once available throughout the Fraser River estuary, but Musqueam say that due to encroachment, contamination, and loss of habitat, it is now primarily harvested from or traded for around Tsawwassen First Nation Lands, on the eastern margins of the Project area (Woolman 2014). The plant is a relatively common terrestrial species; as described in EIS Appendix 8-A, terrestrial vegetation does not spatially overlap with the Project, and therefore has no potential to interact with the Project. Since Project construction and operation are not anticipated to interact with terrestrial or freshwater resources, these components were not considered in the EIS. By extension, effects of a change in the availability or quality of these resources on the Current Use of these resources by [Indigenous] groups were not carried forward for further assessment. Based on information reviewed to date and summarised in EIS Section 32.2.4, access to preferred locations for	**EIS** Appendix 8-A Valued Component Selection Rationale 32.2.4.2 Musqueam First Nation **Information Requests** Response to Sufficiency Information Request #05 (IR10-05 of CEAR Document #1216)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				the Current Use of terrestrial or freshwater resources is also not anticipated as a result of Project construction and operation.	
MFN-16.5	Indicated support for eelgrass habitat restoration. Noted eelgrass is good for salmon and fish habitat and is consistent with their hereditary approach to restoration.	12-Sep-2016, Issues Workshop – MFN / TFN #2 10-Jul-2017, Roberts Bank Boat Tour #2	**12-Sep-2016:** Recorded comment for consideration by the Project team. **10-Jul-2017:** Recorded comment for consideration by the Project team.	**Addressed in EIS Appendix 7.2-B (#201):** Onsite eelgrass habitat creation is proposed through transplanting in an area approximating 3 ha. Based on the review of previous habitat creation programs (e.g., DP3), eelgrass transplants are considered to be an effective means of increasing productivity of marine vegetation. The VFPA will implement a Follow-up Program, which will include monitoring to confirm that all offsetting measures meet intended objectives and function as designed. Monitoring will include methods and success measures to confirm that offsetting measures have been effective. The *Fisheries Act* Authorisation will require that functional objectives are met.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 17.0 Mitigation for Marine Biophysical Valued Components 17.3.2 Offsetting Potential Effects, Offsetting Framework 17.6 Mitigation for Marine Biophysical Valued Components, Monitoring and Reporting
MFN-16.6	Concerned about the presence of English cordgrass (*Spartina anglica*) at Roberts Bank. Potentially interested in means of offsetting that involve the eradication of *Spartina anglica*.	10-Jul-2017, Roberts Bank Boat Tour #2	**10-Jul-2017, Boat tour:** Stated that the VFPA has been funding the Spartina Working Group for some time and there has been good success in reducing its spread.	**Additional information provided by the VFPA:** As noted in the response to IR-7.31.15-03, the VFPA is a part of the B.C. Spartina Working Group, which maps, tests eradication methods, and supports the removal of invasive English cordgrass from the Fraser River estuary. **Additional information provided by the VFPA:** Beyond the offsetting measures suggested in the EIS, the VFPA encourages Indigenous groups participating in the EA to suggest specific offsetting measures for consideration.	**Information Requests** Response to Information Request #3 (IR-7.31.15-03 of CEAR Document #314)

Table 17: Marine Water Quality – Intermediate Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-17.1	Concerned that dredging activities will negatively impact water quality and sedimentation. Asked what type of equipment would be used for dredging the tug basin.	10-Jul-2017, Roberts Bank Boat Tour #2	**10-Jul-2017, Boat Tour:** Responded that the VFPA did not know the type of equipment offhand but indicated a response could be provided in follow-up. **11-Nov-2017, Email from the VFPA:** Stated that currently there is a general plan which proposes the use of a clamshell off a derrick barge. The area is too small for larger equipment. **26-Jun-2017, Email from the VFPA:** The concerns brought forward by Musqueam First Nation with regard to Dungeness Crabs, DAS, and, in particular, the ITP highlighted the need for the VFPA ("the port authority") to re-evaluate our planned construction approach and use of the ITP as a part of the Project. The Project Team has been actively exploring alternative construction methods to address concerns raised by Indigenous groups and regulatory agencies since the development of the EIS in 2014. After undertaking a thorough investigation that included further engineering work, consideration of new locally available dredging equipment, and relaxation of the *Coasting Trade Act* as a result of approving the Canadian European Trade Agreement, the port authority determined that the Project could proceed without the use of an ITP. In addition, the elimination of the ITP, along with other changes will result in a Project that does not require a DAS permit.	**Addressed in EIS Section 9.6:** Changes to surficial geology and marine sediment during Project construction activities are expected to be minimal or undetectable relative to natural variability. **Addressed in PCU:** As requested by the Review Panel, the VFPA submitted the PCU on June 12, 2018, providing: • Detailed revised Project description, including a revised construction schedule; • Revised Project interaction matrix; • Preliminary details pertaining to the management and timing of dredging activities and the discharge of sediment-laden water; and • Revised assessment of environmental effects as required by the Project modifications. PCU Sections 1.0 and 2.0 describe the changes to the EIS, including updates to specific construction activities, the construction schedule, and relevant Project Description figures and appendices. In PCU Section 3.0, changes or effects resulting from the construction updates on ICs and VCs are described. Overall, these changes to the EA resulting from construction updates can generally be summarised as follows: • Reductions in potential adverse changes or effects on ICs, biophysical VCs, social VCs, and Current Use; and • Increases in positive interactions with socio-economic VCs. These beneficial changes to ICs and VCs occur at the level of interactions or potential effects, and in most cases are slight changes, and thus do not affect the overall conclusions made in the EIS, including proposed mitigation, residual effect characterisations, significance determinations or cumulative effects, as applicable, with one exception. The only component predicted to have a change to residual effects is land and water use, with a reduction of a residual effect on access to Tsawwassen First Nation community lease lands from a measurable non-significant residual effect to a negligible residual effect, due to elimination of the ITP and associated activities.	**EIS** 9.6 Surficial Geology and Marine Sediment **PCU (CEAR Document #1210)**

Table 18: Mitigation for Marine Biophysical Valued Components (including Onsite Habitat Concepts)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-18.1	Concerned that VFPA is only working to offset where it wants to build, and is only implementing enhancement and mitigation as required.	06-Jun-2014, VCs Workshop #1	**06-Jun-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 17.0 Mitigation for Marine Biophysical Valued Components.	**Addressed in EIS Section 17.0:** With respect to habitat off-setting plans, see EIS Section 17.3.2 Mitigation for Marine Biophysical Valued Components, Offsetting Potential Effects, Offsetting Framework. **Additional information provided by the VFPA:** Across all of VFPA operations, the VFPA adopts a holistic approach to protecting the water, land and wildlife within VFPA jurisdiction through a variety of programs that benefit our aquatic environment, port lands, and the wildlife that inhabit these areas. More information on this topic can be found on VFPA's website: https://www.portvancouver.com/environment/. The port authority leads a suite of initiatives aimed at tracking and reducing air emissions associated with key port activities: shipping, trucking, cargo-handling, and tenant operations. PORT WIDE Port-wide Emissions inventory: Our activity-based emissions inventory enables us to estimate port-related air emissions from a variety of sources. The inventory informs our policies and programs by helping us identify trends and priority areas for action. Learn more about our emissions inventory: https://www.portvancouver.com/environment/air-energy-climate-action/port-wide/. Northwest Ports Clean Air Strategy: The strategy was developed in partnership with the ports of Seattle and Tacoma and the Northwest Seaport Alliance to reduce port-related air emissions in the Georgia Basin-Puget Sound air shed. Learn more about the Northwest Ports Clean Air Strategy: https://www.portvancouver.com/environment/air-energy-climate-action/port-wide/. Air quality monitoring: We collaborate with Metro Vancouver and other partners to monitor air quality around the port. Learn more about air quality monitoring: https://www.portvancouver.com/environment/air-energy-climate-action/port-wide/. SHIPS EcoAction Program: Ships can receive harbour dues discounts by meeting voluntary best practices that reduce emissions and other environmental impacts. Learn more about our EcoAction program for ships: https://www.portvancouver.com/environment/air-energy-climate-action/marine/. Shore power: Specialised equipment allows ships at berth to shut off their diesel-powered engines and connect to the electricity grid, significantly reducing emissions that contribute to both air pollution and climate change. Learn more about our shore power installations: https://www.portvancouver.com/environment/air-energy-climate-action/marine/. TENANT OPERATIONS Non-Road Diesel Emissions Program: We work with port tenants to accelerate upgrading of older, higher-emission diesel equipment through a combination of fees and rebates. Learn more about our Non-Road Diesel Emissions Program: https://www.portvancouver.com/environment/air-energy-climate-action/terminal-energy-efficiency/nrde/.	**EIS** 17.0 Mitigation for Marine Biophysical Valued Components

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				Energy Action: In partnership with BC Hydro, this program helps port tenants advance energy conservation measures and access financial incentives. Learn more about Energy Action: https://www.portvancouver.com/environment/air-energy-climate-action/terminal-energy-efficiency/energy-action-initiative/. Climate Smart: We offer training to help port tenants measure and reduce greenhouse gas emissions. Learn more about Climate Smart: https://www.portvancouver.com/environment/air-energy-climate-action/terminal-energy-efficiency/. CONTAINER TRUCKS Truck Licensing System: Container trucks that access the port meet minimum environmental requirements for engine age, emission controls and idle reduction. Learn more about our Truck Licensing System: https://www.portvancouver.com/environment/air-energy-climate-action/container-trucking/ **Further information provided by the VFPA:** The VFPA-led ECHO Program is a collaborative initiative aimed at better understanding and managing the impact of shipping activities on at-risk whales throughout the southern coast of B.C. The ECHO Program engages and involves key regional interested parties to maximise program success and help ensure that mitigation and management measures developed through the program are informed by social, cultural, economic, and environmental sustainability interests. The ECHO Program is guided by the advice and input of an advisory working group, and supported by a federal government advisory committee and associated technical committees. Through engagement and consultation with stakeholders, including Indigenous individuals, the ECHO Program has initiated or supported short-term projects, scientific studies, and educational initiatives to fill knowledge gaps necessary to inform the development of credible, science-based threat reduction solutions and management options to reduce cumulative effects of shipping to at-risk whales in the region. Further information about ECHO Program can be found at: https://www.portvancouver.com/environment/water-land-wildlife/echo-program/.	
MFN-18.2	Interested in the artificial reefs constructed as part of DP3 and that more is proposed for RBT2, and any related publicly available information.	10-Jul-2017, Roberts Bank Boat Tour #2	**10-Jul-2017, Boat Tour:** Recorded comment for follow-up. **20-Nov-2017, Email from the VFPA:** Attached the "2010 Deltaport Subtidal Reef Compensation Monitoring Report" and associated images from Balanced Environmental.	**Additional information provided by the VFPA:** The VFPA has published annual monitoring reports on the Adaptive Management Strategy for DP3, which are available on VFPA's website: http://www.portvancouver.com/development-and-permits/status-of-applications/deltaport-third-berth-project/. **Addressed in EIS Section 17.0:** As part of the offsetting framework described in EIS Section 17.0, the VFPA is proposing to support rockfish populations and assist in meeting fisheries management objectives to alleviate historical declines of regional populations. The creation of approximately 2 ha of reef habitat would benefit macroalgae vegetation, and provide refuge, feeding and spawning habitat for invertebrates, fish and birds. Subtidal rock reefs would be developed adjacent to, and as extensions of, the productive subtidal rock reefs constructed as part of DP3.	**EIS** 17.0 Mitigation Framework for Marine Biophysical Valued Components
MFN-18.3	Stated that it is Musqueam's expectation that the EISg requirement – which implies that a requirement of the EIS is to make a determination first of	15-Jun-2015, Letter to the CEA Agency (CEAR	**15-Oct-2015, Letter from the CEA Agency:** "The Agency has requested additional information on wetlands in its letter of July 31, 2015 to Port Metro Vancouver [the VFPA] (page 11, #22).	**Addressed in Response to IR-7.31.15-22:** The VFPA's response to IR-7.31.15-22, provides a consolidated description of the location, size, type, species composition, and ecological functions of wetlands potentially affected by the Project.	**EIS** 17.4 Wetland Assessment **Information Requests** Response to Information Request #22 (IR-7.31.15-22 of CEAR Document #314)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	whether a wetland compensation plan (WCP) is required, a necessary prerequisite to describing its requirements (if any) – has not been met. The results of a wetland ecological functions (WEF) should be integrated into the EIS prior to it being considered complete, not added as a later appendage. In the event that WEF assessment determines the need for a WCP, the Proponent should be required to consult with Musqueam regarding potential offsetting locations to ensure accommodation of impacts on Musqueam territory and rights.	Document #241)	The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review.”	**Addressed in EIS Section 17.4:** As part of the development of the Offsetting Plan, the VFPA has initiated discussions and will continue to work with the Canadian Wildlife Service to complete a wetland ecological functions assessment to confirm that the requirements for wetland compensation have been met, based on the habitat assessments completed as part of the EIS.	

Table 19: Noise and Vibration – Intermediate Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information

MFN-19.1	Asked whether noise is measured only for the Project or cumulatively.
	Asked if all aspects of shipping noise are assessed (e.g. the sounding of horns related to navigation), as opposed to just noise generated when a ship is idling at the terminal.
	Asked if noise was measured at or near the Musqueam reserve.
		19-Nov-2014, Health & Aboriginal Rights Workshop - MFN	**19-Nov-2014, Workshop:**
			Stated that the VFPA would take those questions for consideration and that additional information would be made available to Musqueam (EIS).
			01-Apr-2015, Letter from the VFPA:
			Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.
				Addressed in EIS Section 9.3.6.2:
				The upland study area includes noise and vibration-sensitive receptors in Delta, Point Roberts and Washington that are within 5 km of the existing Roberts Bank terminals and 2 km of the northeast edge of the Roberts Bank Causeway (see EIS Figure 9.3-1). The boundaries were chosen to include all upland areas where Project-related noise levels could potentially exceed the World Health Organization (WHO) sleep interference threshold.
				The upland study area includes Musqueam IR 4 but ends south of Canoe Pass. The Musqueam community living at Musqueam IR 2 and 3 are not within the study area.
				The assessment of potential changes in atmospheric noise associated with marine shipping beyond the VFPA's jurisdiction is provided in MSA Section 7.4.
				Addressed in EIS Appendix 7.2-B (#43):
				The potential changes in noise and vibration that may be caused by the Project, and the potential effects of those changes on biophysical VCs and human health are considered in the EIS. Mitigation measures to address noise-related effects are also described in the EIS.
				The noise and vibration assessment examined potential changes in noise and vibration as a result of the Project. The results of the noise and vibration assessment were used in the assessments of coastal birds, marine commercial use, outdoor recreation, human health, and Current Use.
				The assessment considered the potential changes in noise and vibration that may result from the Project and the potential cumulative changes in noise and vibration that are likely to result from the Project in combination with other certain and reasonably foreseeable projects and activities, including incremental marine vessel traffic.
				• The assessment considers noise and vibration from trains, as a source contributing to existing conditions, as well as a potential Project-related source of noise and vibration and a potential source of cumulative change in noise and vibration.
				• Mitigation measures related to noise are included in the human health assessment (EIS Section 27.9.2).
				The assessment considered Project-related sources of noise and vibration, including construction equipment, container ships at berth, container handling activities, and movement of trains and trucks on the terminal and causeway. The assessment focused on continuous noise, low frequency noise, transient and impulsive noise, and ground-borne vibration.
				The assessment concluded that:
				• Project-related changes in annual average noise levels in communities near the Project are expected to be minor and, for the most part, not perceptible.
				• The Project, in combination with other certain and reasonably foreseeable projects and activities, is expected to result in minimal incremental cumulative changes to noise in areas close to road and rail corridors.
				• Some changes in noise conditions that could be perceptible include:
				  ○ Increased noise during periods of peak construction activity.
				  ○ The number of intermittent noises during operation would increase, but the noise levels would be the same or lower than from the existing Roberts Bank terminals.
				  ○ Increased noise in marine areas is expected to be perceptible close to the terminal.

Table 20: Port Operations

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-20.1	Asked about anchorages in English Bay that are associated with Roberts Bank Terminals. Asked if support vessels (tugs) travel from English Bay to Roberts Bank.	22-Jan-2016, Meeting	**22-Jan-2016, Meeting:** Responded that ships visiting a Roberts Bank terminal would only anchor in English Bay in adverse conditions. If container ships are backed up at Deltaport, vessels tend to slow down to delay arrival. Noted container ships arrive within a scheduled window, like an airplane. Explained that tug boats do not travel from English Bay. There is a tug basin at Roberts Bank which will be expanded as part of the Project.	**Addressed in MSA Appendix 5-B (#3):** Anchorage is discussed in MSA Section 4.0. Container ships operate on a scheduled service, and adjust their speeds as required to arrive at the terminal within their assigned arrival window; thus, anchorage is not a normal requirement and there are no plans or requirements for off-terminal anchoring of container ships waiting for a berth at the new RBT2 marine terminal. Exceptions to this could occur in the event of an extreme storm event in the Pacific, resulting in refuge anchorage requirement for safety reasons, or to accommodate unexpected ship-specific maintenance, personnel, or operation issues that may arise. The assessment of marine shipping associated with the Project is based on a routine vessel transit scenario. Because anchorage only occurs in rare circumstances, anchorage is not assessed as an activity related to marine shipping associated with the Project. **Additional information provided by the VFPA:** Existing anchorage locations are provided in a map in Transport Canada Appendix C Figure 1 of CEAR Document #982, along with very detailed information regarding anchorages in its response to Panel information request TC IR-07. As part of this response, Appendix C (Pacific Pilotage Authority Marine Shipping Area Anchorage Locations and Specifications) provided the longitudinal and latitude coordinates for all anchorages along with the associated maps for the anchorages outside of VFPA jurisdiction. The anchorages within VFPA jurisdiction are shown on pages 85 and 86 of the Port Information Guide issued as Appendix IR1-01-A in IR1-01 (CEAR Document #897).	**MSA** 4.0 Activity Description 4.2.2.2 Anchorage Appendix 5-B Aboriginal Issues and Interests **From Transport Canada to the Review Panel re: Response to Information Requests issued by the Review Panel on May 10, 2017 (CEAR Document #962)**
MFN-20.2	Asked about the effects of cooling water discharged from ships at berth, and whether this warms the surrounding water.	12-Jun-2017, Roberts Bank Boat Tour #1	**12-Jun-2017, Boat Tour:** Noted this was a question that hadn't been raised previously and did not know the response. Speculated that if cooling water is discharged by ships at Deltaport, it would be unlikely to result in measurable change on temperature given the dilution at the receiving site.	**Additional information provided by the VFPA:** The requirement for using sea water to cool engines would be minor, if any, given container ships at berth use auxiliary engines or shore power. For ships at berth, any cooling water discharge effect would likely be unmeasurable given amount of water being exchanged relative to the water body and the mixing action of currents and tidal flows.	

Table 21: Potential Accidents or Malfunctions

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-21.1	Stated that the increased tanker traffic in the river due to this project poses a risk to Musqueam fishers safety, as the river is currently at maximum capacity for traffic and creates unsafe fishing situations.	15-Oct-2013, Letter to the CEA Agency (CEAR Document #41)	The VFPA has reviewed this letter and provides the following additional information.	**Additional information provided by the VFPA:** As RBT2 is a container port project, only container ships will call at the new proposed terminal, not tankers. River traffic is not anticipated to increase as a result of RBT2.	**EIS** 4.0 Project Description

MFN-21.2	Stated that fewer but bigger ships are a safety concern for our fishers.	16-Jul-2013, Meeting	**16-Jul-2013, Meeting:**
			Recorded comment for consideration by the Project team.
			30-Sep-2016, Letter from the VFPA:
			Responded that comments have been included and incorporated in the AIMSA, and will also be submitted directly to the Review Panel and posted on the public registry.
			Enclosed AIMSA Appendix 2-B showing the issues raised by Musqueam First Nation and the VFPA's responses.
				Addressed in MSA Section 10.4.1:
				Discusses the risk mitigation practices in the marine shipping area, applicable to ships associated with the project. This include:
				• Vessel traffic management system including radar surveillance and traffic separation zones;
				• Pilotage for all vessel moves within the region;
				• Navigational aids; and
				• Precautionary areas and special operating instructions.
				Addressed in Response to IR4-02:
				Table IR4-02-1 provides the fleet distribution and number of vessel calls in 2050 for each scenario. RBT2 terminal operations in 2050 are assumed to be similar to 2030 at 2.4 million TEUs, and the number of weekly services and vessel calls is anticipated to decrease as ship sizes increase (as previously stated in EIS Section 4.4.2.1).
				Addressed in AIMSA – MFN and TWN Section 7.4:
				Discusses MSA-related suggested mitigation measures related to Current Use and Rights. The measures are:
				• Consultation on the development of a potential marine shipping activities communication plan that would provide affected Indigenous groups with real-time information regarding the movement of Project-associated shipping traffic through the marine shipping area, including:
				  ○ The estimated time of arrival of Project-associated container ships and their expected duration of use of the shipping lanes for inbound and outbound movements; and
				  ○ Circumstances outside normal operations that might affect the expected frequency or concentration of Project-associated vessel traffic along the shipping routes (e.g., clearing backlogs in shipping traffic due to storms requiring ships to temporarily anchor before proceeding).
				• Consultation with the affected Indigenous groups to identify measures that would reduce the impact of the international shipping lanes to fishing by Indigenous groups.
				Potential effects on current use as a result of Project-associated vessel transit activities are considered negligible before mitigation for access to preferred current use locations, due to Project-associated ship wake, the availability and quality of preferred current use resources, and the quality of the current use experience (i.e., cultural practices) tied to those aspects of current use. Residual effects on access to preferred current use locations due to Project-associated container ship pass-bys, and on cultural practices tied to that aspect of current use, are considered negligible after the implementation of mitigation.
				Musqueam First Nation has indicated that the above-noted mitigation measures, in Musqueam's view, "do not in themselves provide a measurable form of mitigation" (Musqueam First Nation 2016b). Musqueam have made no specific suggestions to the VFPA regarding mitigation measures for potential effects associated with marine shipping associated with the Project.
					MSA
					10.0 Potential Accidents and Malfunctions
					AIMSA – MFN and TWN
					7.4 Suggested Mitigation Measures
					Information Requests
					Response to Sufficiency Information Request #02 (IR4-02 of CEAR Document #1051)

MFN-21.3	Concerned with the possibility of a collision between a container ship and a fishing vessel.	29-Oct-2014, Preliminary EIS Results Workshop #4	**29-Oct-2014, Workshop:** Responded that the Quantitative Risk Assessment will be an	**Addressed in EIS Appendix 7.2-B (#206):** A quantitative risk assessment of potential accidents and malfunctions related to marine vessel traffic, including the risk of a collision between a container ship and small craft (i.e., fishing and recreational vessels), was undertaken and is described in the Potential Accidents or Malfunctions section (EIS Section 30.0), as well as the Quantitative Risk Assessment (EIS Appendix 30-A).	**EIS** 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Referenced a photo showing one of Musqueam's vessels trying to move away from a large vessel. Asked if there was a determination of a significant effect related to accidents and malfunctions. Noted that fishing vessels are expensive and just one vessel being impacted is significant. Concerned that Project-related marine shipping will result in increased risks to safety and loss of gear while fishing and travelling on the water. Concerned that Project-related marine shipping will lead to increased anxiety and fear regarding safety in the Project area. Concerned that this may result in significant adverse effects on lands and resources for traditional purposes. Concerned about increased anxiety and fear regarding safety in the Project area due to the presence of Project-related marine traffic. Commented that the presentation incorrectly presents navigational safety issues for small vessels as a negligible effect. There is already an effect on navigation safety for small vessels due to existing facilities and traffic. Stated that increasing the number of vessels will increase this problem. Concerned that a potential accident represents a serious risk to Musqueam way of life in an extremely vulnerable state. Stated that one accident could have devastating effects.	19-Nov-2014, Health & Aboriginal Rights Workshop - MFN 22-Jan-2016, Meeting 24-May-2016, Musqueam First Nation Marine Shipping Effects Assessment 20-Jun-2016, Meeting 15-Nov-2017, Letter to Panel (CEAR Document #1098)	Appendix in the EIS. That study indicated that this Project will result in increased vessel traffic. It also asked what other types of vessels they will interact with, and considered the potential risk of collision and/or interaction between them. **19-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. **22-Jan-2016, Meeting:** Responded that the potential effects on current use and impacts on the exercise of established and asserted Aboriginal and treaty rights due to accidents or malfunctions arising from marine shipping were assessed. However, the likelihood of this occurring is very low. **24-May-2016:** Recorded comment for consideration by the Project team.	Data collected by DFO between 2008 and 2012 for vessels in DFO sub-areas encompassing Canadian and U.S. waters transited by ships bound for Roberts Bank was reviewed. These data indicated that daily fishing vessel numbers in the area are low (i.e., no vessels per sub-area on most days; maximum of six vessels on one day in the largest sub-area). On this basis, the QRA estimated the return period for a collision involving a container ship and a fishing vessel as 1 in 50 years, equivalent to a "very low" probability in this assessment. A Land and Marine Traffic Management Plan is included in the Environmental Management Program (EIS Section 33.0) in order to mitigate potential marine vessel traffic issues in the construction phase. **Addressed in AIMSA – MFN and TWN Section 8.0:** The assessment of potential accidents or malfunctions (in the MSA and AIMSA) includes consideration of a collision scenario, involving gear damage between a container ship and a smaller vessel such as a fishing vessel. Potential effects of such an event are assessed for marine commercial use, outdoor recreation, and human health VCs, and Current Use and rights. **Addressed in MSA Section 10.4:** Includes a description of applicable collision risk reduction measures. **Addressed in MSA Section 10.5.13:** The assessment of Current Use presented in MSA Section 10.5.13 considers the risk of collision, and perceptions of safety and determined that residual effects of the collision scenario on Current Use was considered significant, though unlikely to occur. **Addressed in MSA Section 10.0:** The assessment of potential accidents or malfunctions considered potential effects related to a plausible worst-case scenario selected based on the analysed probabilities of occurrence, higher risk areas, and possible consequences. This included: • A collision between a container ship and a small vessel within an existing shipping lane, resulting in damage to the vessel and/or gear as well a serious injury or fatality. The plausible worst-case collision scenario has the potential to result in measurable residual adverse effects on human health, marine commercial use, outdoor recreation, current use, and asserted or established Aboriginal and treaty rights. In all cases, the identified residual adverse effects of a collision are unlikely to occur, because of the very low probability of collision. The assessment concluded that residual adverse effects are expected to be not significant for marine commercial use and outdoor recreation, but significant for human health. For current use, the residual effect could range from not significant to significant, depending on the capacity of the affected Indigenous group to continue to undertake current use. In the event of a collision between a vessel engaged in traditional use activities and a container ship, a minor to serious adverse residual impact on the ability of the affected Indigenous group to exercise Aboriginal and treaty rights associated with those activities would be expected. **Addressed in AIMSA – MFN and TWN Appendix 2-B (#20):** In relation to the marine shipping area, the assessment of Current Use (in the MSA, and in the AIMSA) considers the risk of collision and perceptions of safety in the assessments of access to preferred Current Use locations, and quality of Current Use experience. The assessment of marine commercial use (in the MSA and the AIMSA) considers potential effects of gear damage or loss in relation to commercial fish and seafood harvesting and guided sport fishing (including Indigenous fish and seafood harvesting, and Indigenous guided sport fishing). The assessment of potential accidents or malfunctions (in the MSA and in the AIMSA) includes consideration of a collision scenario, involving gear damage) between a container ship and a smaller vessel such as a fishing vessel. Potential effects of such an event are assessed for marine commercial use, outdoor recreation, and human health VCs, and Current Use and rights. MSA Section 10.0 also includes a description of applicable collision risk reduction measures. The assessment of Current Use considers the risk of collision, and perceptions of safety. #	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			20-Jun-2016, Meeting: Recorded comment for consideration by the Project team. **30-Sep-2016, Letter from the VFPA:** Responded that comments have been included and incorporated in the AIMSA, and will also be submitted directly to the Review Panel and posted on the public registry. Enclosed AIMSA Appendix 2-B showing the issues raised by Musqueam First Nation and the VFPA's responses.	In relation to the Project area, the assessment of Current Use in the EIS assesses potential changes to safety and security from increased vessel traffic. **Addressed in MSA Section 10.4.1:** Discusses the risk mitigation practices in the marine shipping area, applicable to ships associated with the project. This includes: • Vessel traffic management system including radar surveillance and traffic separation zones; • Pilotage for all vessel moves within the region; • Navigational aids; and • Precautionary areas and special operating instructions. **Additional information provided by the VFPA:** On September 16, 2016, the VFPA received an email from Musqueam First Nation stating: "Significance of residual effects on Musqueam CULRTP and Aboriginal rights related to accidents and malfunctions (spill, collision) (pp. 67). Musqueam agrees with both conclusions for significance of effects to CULRTP and seriousness of adverse impacts on rights."	
MFN-21.4	Requested a revised assessment of effects of accidents and malfunctions that includes assessment of effects along the marine transportation route and terrestrial transportation route.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency to Musqueam:** *"The Agency has requested that an assessment of accidents and malfunctions related to marine shipping be carried out in its Updated EIS Guidelines, issued April 17, 2015. This information should be received as part of the addendum on Marine Shipping.* *Link: http://www.ceaa-acee.gc.ca/050/documents/p80054/101303E.pdf"*	**Addressed in MSA Section 10.0:** The MSA addresses the requirements of Section 17 of the *Updated EIS Guidelines* regarding the environmental effects of marine shipping associated with the Project, including consideration of potential accidents and malfunctions beyond Port Metro Vancouver's [the VFPA] care and control and extending to the 12 nautical mile limit of Canada's territorial sea. **Additional information provided by the VFPA:** On September 16, 2016, the VFPA received an email from Musqueam First Nation stating: "Significance of residual effects on Musqueam CULRTP and Aboriginal rights related to accidents and malfunctions (spill, collision) (pp. 67). Musqueam agrees with both conclusions for significance of effects to CULRTP and seriousness of adverse impacts on rights."	**MSA** 10.0 Potential Accidents or Malfunctions ***Updated EIS Guidelines*** 17.0 Marine Shipping
MFN-21.5	Concerned that an increase in shipping traffic, in addition to noise effects, may elevate levels of pollution and the risk of an accident producing fuel spills.	15-Nov-2017, Letter to Panel (CEAR Document #1098)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 9.7:** Project construction and operation activities are not expected to alter water contaminant or nutrient levels, pH, dissolved oxygen, or temperature.	**EIS** 9.7 Marine Water Quality 9.7.8 Future Conditions with the Project

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Stated that pollution may in turn adversely affect fish and crab habitats and fishing resource health directly.			**Addressed in EIS Section 11.6.2.1:** Potential operation-phase changes from wastewater (sewage) and stormwater discharges, and discharges from ships (bilge water and ballast water) are not expected to affect marine vegetation due to the distant location of discharges into subtidal waters, the incorporation of management and treatment measures described in EIS Section 4.2.1 Project Description, Marine Terminal, and the implementation of regulatory requirements and guidelines (refer to EIS Section 9.7.8 for more information). **Addressed in MSA Section 7.3:** Reports that a change in marine water quality is not anticipated as a result of Project-associated vessel transit activities within the marine shipping area, as Project-associated marine vessels are prevented from discharging bilge or ballast water by domestic and international regulations. By extension, a change in the quality of marine resources would also not be expected as a result of water-borne pollution from vessel discharges. **Additional information provided by the VFPA:** Transport Canada's letter to the Review Panel dated April 7, 2017 (CEAR Document #954), as well as, letter to the Review Panel dated December 20, 2017 (CEAR Document #1133) provides additional information on the Government of Canada's Oceans Protection Plan which includes information on spill response and environmental protection. **Further information provided by the VFPA:** The MSA considers the potential effects of increased shipping traffic in the marine shipping area, including potential noise effects and the likelihood and consequence of accidents and malfunctions to fish and crab habitat and health. The conclusion of the MSA is that marine shipping associated with the Project is not likely to result in any significant adverse residual effects to any of the VCs assessed. In addition, no adverse cumulative effects are anticipated, with the exception of potential effects to SRKW. As with the conclusions in the EIS, submitted in March 2015, the MSA concludes that SRKW have already been significantly adversely affected by past projects and activities; therefore, cumulative effects are expected to remain significant. **Addressed in MSA Section 10.0:** The potential changes to ICs and potential effects on VCs were assessed. Potential effects on current use and impacts on the exercise of established and asserted Aboriginal and treaty rights due to accidents or malfunctions arising from marine shipping associated with the Project were also assessed. Several independent studies informed the assessment, including a quantitative risk assessment that estimated probabilities for different types of potential marine vessel accidents from a container ship in transit in the marine shipping area. Two plausible worst-case scenarios were selected for the assessment, based on the analysed probabilities of occurrence, higher risk areas, and possible consequences: • A powered grounding of a container ship on a hard substrate, resulting in a spill of 7,500 m3 of heavy fuel oil; and • A collision between a container ship and a small vessel within an existing shipping lane, resulting in damage to the vessel and/or gear as well as serious injury or fatality. In both cases, the identified residual adverse effects are unlikely to occur, because of the very low probability of the accident scenarios. The assessment for the plausible worst-case spill scenario concluded that, with the exception of human health, measurable residual adverse effects are predicted for all VCs. In all cases, the identified residual adverse effects of a spill are unlikely to occur, because of the very low probability of an accident or malfunction that could result in a spill. With the exceptions of residual effects on marine mammals (SRKW), marine commercial use (guided sport fishing and marine-based tourism sub-components), outdoor recreation, archaeological and heritage resources, and current use, adverse residual effects were considered not significant. A serious residual adverse impact on the ability of Indigenous groups to exercise Aboriginal and treaty rights in areas overlapping or near the hypothetical spill area would be expected in the event of such a spill.	11.6.2.1 Marine Vegetation, Changes in Water Quality **MSA** 7.3 Marine Water Quality 10.0 Potential Accidents or Malfunctions **From Transport Canada to the Review Panel re: Response to Information Requests issued by the Review Panel on May 10, 2017 (See Reference Document 962)** **From Transport Canada to the Review Panel re: Overview of the Government of Canada's Oceans Protection Plan (CEAR Documents #954 and #1133)**

Table 22: Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current Use of Lands and Resources for Traditional Purposes

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-22.1	Stated that fishing in the Fraser River has been essential to the Musqueam since time immemorial. Stated that the Project, poses a risk to Musqueam's ability to fish, as it increases the tanker traffic, and creates another structure within the congested river, which impedes the aquatic resources ability to move upstream. Stated that Musqueam has been a fishing community since time immemorial, and it is a part of Musqueam's culture. Taking that the ability to fish will be removing an integral part of our culture.	15-Oct-2013, Letter to the CEA Agency (CEAR Document #41)	The VFPA has reviewed this letter and provides the following additional information.	**Additional information provided by the VFPA:** The VFPA acknowledge the importance to Musqueam of fishing in the Fraser River. **Addressed in EIS Appendix 7.2-B (#183):** The Current Use assessment considers the quality of the experience of carrying out Current Use activities, which considers cultural aspects. The assessment of impacts on rights also considers cultural aspects and practices. The importance of traditional foods to culture and tradition is considered in the Current Use assessment (EIS Section 32.2). **Addressed in EIS Appendix 7.2-B (#185):** The Project is not located on the Fraser River and no Project-related effects are predicted on the Fraser River. **Addressed in EIS Section 13.0:** EIS Section 13.0 presents an assessment of potential effects to Marine Fish. The assessment concludes there are no significant adverse effects from the Project, as marine fish productivity or long-term integrity would not be compromised. The Project is not expected to result in measurable incremental adverse cumulative effects to marine fish.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 13.0 Marine Fish 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Lands and Resources for Traditional Purposes
MFN-22.2	Stated that access and other resources will be negatively impacted; crab, shellfish, migratory and resident birds.	15-Oct-2013, Letter to the CEA Agency (CEAR Document #41)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Sections 12.0 and 15.0:** The crab and shellfish assessments are presented in EIS Section 12.0. The resident and migratory bird assessment is provided in EIS Section 15.0. **Addressed in EIS Section 32.0:** The assessment presented in EIS Section 32.0 discusses potential changes in access to preferred current use locations. Following implementation of the mitigation, adverse residual Project-related effects are expected to be negligible.	**EIS** 12.0 Marine Invertebrates 15.0 Coastal Birds 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes
MFN-22.3	Asked how assessment considers several of the biophysical components in the EIS (i.e., geomorphology, noise and vibration) that have impacts to Musqueam's rights.	03-Jul-2014, VCs Workshop #2	Stated that this matter is being assessed in other parts of the EIS. The EA is structured to look at targeted topic areas.	**Addressed in EIS Section 32.0:** The effects assessment for EIS Section 32.0 draws forward the results of the effects assessments for the following VCs: EIS Sections 11.0 Marine Vegetation, 12.0 Marine Invertebrates, 13.0 Marine Fish, 14.0 Marine Mammals, 15.0 Coastal Birds, 16.0 Ongoing Productivity of Commercial Recreational and Aboriginal Fisheries and 21.0 Marine Commercial Use. Other elements of the EIS considered in addressing potential effects to Current Use are presented as follows: EIS Sections 9.2 Air Quality, 9.3 Noise and Vibration, 9.4 Light, 25.0 Visual Resources, 27.0 Human Health, 28.0 Archaeological and Heritage Resources, and 30.0 Potential Accidents or Malfunctions.	**EIS** 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes
MFN-22.4	Requested that the current fishing management area Musqueam has with DFO be added to the map. Requested to note that the Musqueam secondary use area is not captured in the map.	19-Nov-2014, Health & Aboriginal Rights Workshop – MFN	**19-Nov-2014, Workshop:** Committed to include a map of the current fishing management area that Musqueam has with DFO. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included a map of the current fishing management area Musqueam.	**Addressed in EIS Appendix 7.2-B (#195):** A map of the current fishing management area Musqueam has with DFO is included in EIS Section 21.0. The map does not reflect secondary use areas, as per Musqueam's request.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 21.0 Marine Commercial Use Figure 21-7 Tsawwassen and Musqueam Harvesting Areas

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-22.5	Noted that the Musqueam asserted Traditional Territory boundary shows the area for which exclusivity is recognized. Requested that the EIS include a map of Musqueam's entire use area (where arrangements were made with other Nations to gather and utilize resources), which extends over a greater area.	19-Nov-2014, Health & Aboriginal Rights Workshop – MFN	**19-Nov-2014, Workshop:** Stated that Musqueam's request has been factored into the EIS analysis. Asked if Musqueam would like the VFPA to include the larger use area on the map. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in EIS Appendix 7.2-B (#178):** The VFPA provided draft summaries of past and current use and community information within EIS Section 32.0 for review by each Indigenous group and comments received were incorporated.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes
MFN-22.6	Concerned that mitigation measures described for traditional food harvesting and gathering are unsatisfactory to Musqueam interests, as well as for commercial crab fishers. Requested more information on how VFPA plans to preserve subsistence food sources.	19-Nov-2014, Health & Aboriginal Rights Workshop - MFN	**19-Nov-2014, Workshop:** Stated that mitigation measures for the different components were included in the presentations made at the previous four workshops; unfortunately, experts for each of those components aren't present today. Committed to compiling that information for Musqueam when available. Noted that proposed mitigation measures for biophysical components were presented during the fall Aboriginal Groups Workshop in October. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. The EIS also contained information on proposed mitigation measures. **18-Apr-1016, Package with USB:** Provided a binder of past materials, including all notes, presentations and handouts from the 07-Oct-2014, 08-Oct-2014, 28-Oct-2017, 29-Oct-2014 and 19-Nov-2014 meetings.	**Addressed in EIS Appendix 7.2-B (#144):** Measures to avoid, reduce or offset include: • Awareness and education measures regarding contamination levels in food sources; Mitigation related to productivity of marine invertebrates includes: • Placing marine terminal in subtidal waters to eliminate direct effects to intertidal habitats; • Minimising causeway widening and optimising the footprint within the upper intertidal zone; • Rounding of the northwest terminal corner to reduce the potential area of scour; and • Incorporating rocky shoreline in portions of the terminal perimeter and causeway perimeters; • Creating onsite habitat, including eelgrass, intertidal marsh, mudflat, and sandy gravel beach; and • Implementing various Construction Environmental Management Plans and Operation Environment Management Plans. Details on proposed mitigation measures for potential effects on the Current Use, including food harvesting or gathering, are described in the EIS.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 27.0 Human Health 27.7.3 Mitigation Measure #3 – Measures to Decrease Stress and Annoyance 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2.7 Mitigation Measures Table 32-7 Summary of Mitigation Measures to Address Adverse Project Effects on Current Use
MFN-22.7	Stated that the project area is an important area to catch crab. Stated that the expansion of a physical structure into Musqueam's crabbing area is going to have a negative impact on Musqueam's rights.	15-Oct-2013, Letter to the CEA Agency (CEAR Document #41) 19-Nov-2014, Health & Aboriginal Rights Workshop – MFN	The VFPA has reviewed this letter and provides the following additional information. **19-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. **12-Apr-2018, Letter from the VFPA:** Stated that since your concerns were raised, the Project team has conducted	**Addressed in EIS Appendix 7.2-B (#120):** In the Marine Commercial Use assessment, a residual effect is considered significant when all of the following conditions are met: • The effect occurs to a known area of commercial marine-based activity or potential; • The effect displaces or excludes commercial marine-based activities from a known use area; • There are associated adverse harvest or revenue effects due to the displacement; and • The displaced commercial marine-based activity cannot move to known alternative activity areas due to regulatory reasons. The Project is expected to result in a residual effect of changes to seafood harvesting area, harvest and revenue. This residual effect (related to the displaced crab harvesters) is determined to be not significant, however, as	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 12.0 Marine Invertebrates 16.0 Ongoing Productivity of Commercial, Recreational, and Aboriginal Fisheries 21.0 Marine Commercial Use 21.7 Future Conditions with the Project – Potential Project-related Effects 21.10 Determination of Significance of Residual Adverse Effects

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the Crab Mitigation Summary Overview, which detailed the following: • Mitigation measures to avoid or reduce effects to crab as outlined in the EIS, and • Additional crab harvesting related mitigation measure suggestions under review. Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.	Dungeness crab are known to move substantial distances to baited traps, and harvest activity can be moved to another open area. The potential for an adverse effect related to changes in access to preferred Current Use locations for crab is discussed in EIS Section 32.2.6. With the implementation of mitigation measures (EIS Section 32.2.7), residual Project-related effects on Current Use are expected to be negligible EIS (Section 32.2.8). Detailed assessment in EIS Section 12.0. **Addressed in EIS Section 32.3:** The Project is not predicted to adversely impact the ability of Indigenous groups to exercise most asserted or established Aboriginal and treaty rights. The only exception is the harvesting of crabs for domestic or food, social or ceremonial purposes, it is predicted the Project would likely impact Tsawwassen First Nation's ability to exercise the treaty right to fish for crab for domestic purposes based on potential changes in access to a primary crab harvesting location. For similar reasons, such Project-related effects would also be expected to impact Musqueam First Nation's ability to exercise the asserted Aboriginal right to harvest crab for food, social, or ceremonial purposes. Measures to avoid, reduce or otherwise address predicted effects on Current Use (see EIS Section 32.2.7) were considered effective at also addressing expected impacts to the exercise of Aboriginal and treaty rights, and no additional measures have been determined to be required for predicted impacts. **Addressed in Response to IR7-34:** As noted in the VFPA's response to IR7-34, mitigation measures currently undergoing consultation and evaluation include: • Crab Management Area re-selection opportunity; • Adjustment of proposed navigational closure area expansion with consideration of commercial harvesting during Project operation; • Adjustment of the proposed navigational closure area expansion with consideration of Indigenous harvesting during operation; • Navigational Limited Access Fishing Area (multi-user system during operation); and • Financial compensation. The evaluation of additional mitigation measures is being informed by consultation with commercial crab harvesters (including the Area I Crab Fisherman Association), Indigenous groups, DFO, and may include other relevant regulatory agencies regarding their specific interests and concerns.	Table 21-10 Summary of Determination of Significance of Residual Effects for Marine Commercial Use 24.0 Outdoor Recreation 24.6 Future Conditions with the Project – Potential Project-related Effects 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes **Information Requests** Response to Sufficiency Information Request #34 (IR7-34 of CEAR Document #1172)
MFN-22.8	Stated that Musqueam has to think about the return of species currently not targeted for harvesting. This could be temporary, but it will be on the same tide that large vessels would come in on; that's the same time that fish hold and come up. The opening or license may only be for that day; those things (fishery openings and ideal conditions for large vessel berthing) line up quite frequently.	19-Jul-2016, Issues Workshop - MFN / TFN #1	**19-Jul-2016, Workshop:** Recorded comment for consideration by the Project team.	**Addressed in Response to IR10-26:** The VFPA's response to IR10-26, as requested by the Review Panel, discusses potential effects of the proposed Project on the reasonably foreseeable future Current Use activities that have been identified by Indigenous groups.	**Information Requests** Response to Sufficiency Information Request #26 (IR10-26)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-22.9	Stated that the Project will impact the actual practice of going out and fishing and catching – Musqueam's ability to take youth out on the water and teaching them the cultural practices and traditions– if these structures continue to be built in the river we will not be able to do that in the future. Stated that individual impacts don't just occur to one species in space and time: if the Project will infringe on fish, it will in turn infringe on Musqueam and the Musqueam way of life. Explained there is cultural connection to both the fish and the act of fishing and they are equally important. Impacts to fish that in turn impact Musqueam's ability to fish, in turn impact the transfer of knowledge and the traditional classroom where teaching would otherwise take place.	15-Oct-2013, Letter to the CEA Agency (CEAR Document #41) 19-Jul-2016, Issues Workshop - MFN / TFN #1 16-Jun-2017, Meeting with Administrative Staff	**19-Jul-2016, Workshop:** The VFPA undertook to return at a future date to discuss eulachon, crab and coastal geomorphology in greater depth. **12-Sep-2016, Issues Workshop MFN / TFN #2:** Eulachon, crab and coastal geomorphology were discussed at a subsequent issues workshop held between the VFPA, Musqueam and Tsawwassen First Nation. **16-Jun-2017, Meeting:** Recorded comment for consideration by the Project team. **08-Nov-2017, Email from the VFPA:** Requested to schedule a meeting to discuss sockeye salmon and eulachon studies. **15-May-2018, Email from the VFPA:** Requested to meet to get input from Musqueam on some potential eulachon, sturgeon and salmon studies that have been brought to my attention by LFFA and others. Noted that there may be some opportunity to do fish-related studies through the RBT2 legacy benefits.	**Addressed in Response to IR10-22:** The VFPA's response to IR10-22, as requested by the Review Panel, further discusses the assessment of cultural heritage, potential disruptions or loss of ceremonial and cultural practices, as well as a potential disruption to sense of belonging, identity and spirituality**.**	**Information Requests** Response to Sufficiency Information Request #22 (IR10-22)
MFN-22.10	Concerned about potential Project-related effects on Musqueam's rights under the Sparrow decision. Stated that VFPA has to provide a justification for infringing on Musqueam's rights. Concerned that the Sparrow decision is not referenced within the EIS as an information source. Concerned that VFPA interprets Sparrow too narrowly. Requested that effects to Musqueam's traditional harvesting be looked at within the context of Musqueam under Sparrow, rather than in the context of other Aboriginal groups.	06-Jun-2014, VCs Workshop #1 17-Nov-2014, Meeting 19-Nov-2014, Health & Aboriginal Rights Workshop – MFN 08-Jan-2015, Meeting 22-Jan-2016, Meeting	**06-Jun-2014, Workshop:** Recorded comment for consideration by the Project team. **17-Nov-2014, Meeting:** Recorded comment for consideration by the Project team. **19-Nov-2014, Workshop:** Noted Musqueam's concern and stated that these would be considered prior to the EIS being finalised. **05-Dec-2014, Letter from the VFPA:** "To be clear, VFPA fully acknowledges and respects the critically important decision of the Supreme Court of Canada in Sparrow. We have read and absorbed the findings of the Court. We recognize the importance of this decision to Musqueam and we further recognize the importance placed by Musqueam on its fishing rights. VFPA is also aware of and respects the many and various court decision that have subsequently applied and expanded on the seminal decision in Sparrow.	**Addressed in EIS Appendix 7.2-B (#186):** It is the VFPA's understanding that Musqueam First Nation has an established right to fish for food, social, and ceremonial (FSC) purposes in Canoe Passage pursuant to R. v. Sparrow [1990], 1 S.C.R. 1075 and it is included as an information source with respect to Musqueam rights and interests. The VFPA further understands that Musqueam also assert an Aboriginal right to fish for FSC purposes over a broader area than Canoe Passage. Potential impacts of the Project on Musqueam's established Aboriginal right to fish for food, social and ceremonial purposes (pursuant to Sparrow) are addressed in EIS, specifically within EIS Section 32.0, separately from potential effects to other Indigenous groups.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Lands and Resources for Traditional Purposes 32.3 Potential Adverse Effects on Aboriginal and Treaty Rights and Related Interests Analysis

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			VFPA wishes to meaningfully engage with Musqueam in order to fully understand Musqueam's perspective and views regarding (i) its Aboriginal rights, including title, (ii) potential impacts on those rights arising from the Project and (iii) potential means by which such adverse effects may be avoided, mitigated, or otherwise accommodated. In doing so, we are cognizant and respectful of the findings of the Supreme Court in the Sparrow decision. At the same time, VFPA does not believe that engaging in extensive legal debate is conducive to a productive engagement process and/or healthy relationship-building." **09-Dec-2014, Email from the VFPA:** Provided draft EIS Section 32.0. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. **15-Jan-2015, Email from the VFPA:** Provided comments on the draft EIS Section 32.0. **22-Jan-2016, Meeting:** Noted that a letter from the VFPA went to Musqueam in December 2014 addressing Sparrow.		
MFN-22.11	Concerned that the interactions identified in this Report are likely to result in adverse effects on Musqueam use and occupancy, including on proven fishing rights (i.e., the Sparrow Case) and Aboriginal rights.	24-May-2016, Musqueam First Nation Marine Shipping Effects Assessment 20-Jun-2016, Meeting	**24-May-2016:** Recorded comment for consideration by the Project team. **30-Sep-2016, Letter from the VFPA:** Responded that comments have been included and incorporated in the AIMSA, and will also be submitted directly to the Review Panel and posted on the public registry. Enclosed AIMSA Appendix 2-B showing the issues raised by Musqueam First Nation and the VFPA's responses.	**Addressed in AIMSA – MFN and TWN Appendix 2-B (#30):** The VFPA has reported this concern, and the rights identified in the concern, in AIMSA Section 7.8.1 Approach to the Rights Assessment. The analysis of potential adverse impacts of marine shipping associated with the Project on the exercise of Aboriginal rights includes an evaluation of potential adverse impacts on the exercise of asserted and proven rights identified by Musqueam.	**AIMSA – MFN and TWN** Appendix 2-B Aboriginal Issues and Interests 7.0 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights 7.8 Potential Impacts on Asserted or Established Aboriginal and Treaty Rights
MFN-22.12	Stated that EIS, Appendix 7.2-b needs to be disaggregated to provide more detail on the issues raised (including specific language of concerns) by each individual First Nation. Stated that Appendix 7.2-b needs to identify any mitigation, monitoring, or alternatives proposed by First Nations	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The EIS guidelines do not require the information to be disaggregated. However, in the Agency's letter of July 31, 2015 requesting additional information (#30, page 14), the Agency has requested:	**Additional information provided by the VFPA:** By way of these tables, the VFPA is providing a listing of all Musqueam comments concerning the Project and marine shipping associated with the Project along with the VFPA's responses.	**Information Requests** Response to Information Request #30 (IR-7.31.15-30 of CEAR Document #314) Response to Additional Information Request #30 (AIR-12.04.15-30 of CEAR Document #388)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	to overcome potential impacts, and data collection and analysis "asks" of each individual First Nation. Stated that this revised "per First Nation" appendix then needs to be ground truthed/ verified by each First Nation prior to it being filed into evidence. The same is required of the list of potential adverse effects on Aboriginal and Treaty rights in Section 32.3 outstanding" in Section 32.3.3.4 and the unilaterally developed list of Aboriginal issues "VFPA considers to be outstanding" in Section 32.3.3.4.		'Provide a rationale for the conclusions of the effects assessment for the current use of lands and resources for traditional purposes by Aboriginal peoples where the conclusions are reported as "no effect" or "negligible". Presenting the effects assessment on a per group basis may help clarify the various conclusions.'"	**Addressed in Responses to IR-7.31.15-30 and AIR-12.04.15-30:** Responses to IR-7.31.15-30 and AIR-12.04.15-30 provide rationale for the conclusions of the effects assessment for the Current Use by Indigenous peoples. **Addressed in Response to IR 7-31:** The VFPA's forthcoming response to IR7-31, as requested by the Review Panel, provides a summary of the views of Indigenous groups in relation to the proposed mitigation measures that were considered in the preparation of the EIS for each biophysical valued component, including views about offsetting. **Additional information provided by the VFPA:** The VFPA's responses IR10-02, IR10-06, IR10-08, IR10-13, and IR10-15, as requested by the Review Panel, further discuss aspects of the current use effects assessment.	Response to Sufficiency Information Request #31 (IR7-31) Response to Sufficiency Information Request #2 (IR10-02) Response to Sufficiency Information Request #06 (IR10-06) Response to Sufficiency Information Request #08 (IR10-08) Response to Sufficiency Information Request #13 (IR10-13) Response to Sufficiency Information Request #15 (IR10-15)
MFN-22.13	Stated that the Proponent did not accede to the Musqueam request for a distinct and separate engagement/consultation/justification process, making this an outstanding issue in the EA and a breach of the Crown's duty to justify any proposed infringement of Musqueam's established Aboriginal right to fish, and state that Musqueam requests the Proponent to take proactive steps to engage Musqueam in setting up a customized consultation and justification process for the Nation.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "Justification of potential infringement of Musqueam's established Aboriginal right to fish is not required in the EIS guidelines. However, the Panel review process will be a good forum for Musqueam to describe their views and rationale on whether or not the project should proceed. The Crown will seek further discussion of such issues during Phase IV of the environmental assessment process, once the Panel has submitted its report."	**Addressed in EIS Appendix 7.2-A:** EIS Appendix 7.2-A describes the consultation undertaken during the development of the EIS including with respect to data collection, proposed mitigation measures and significance determinations. **Additional information provided by the VFPA:** This concern has been noted in the EIS. Musqueam was involved in pre-consultation for the RBT2 Project as described in EIS Section 7.2.2. VFPA has consulted with Musqueam in individual and group settings, and Musqueam has been provided with the opportunity to consult in accordance with their preferences. VFPA has and will continue to engage with Musqueam with the objective of reaching potential terms of reference or a protocol for future consultation.	**EIS** 7.2.2 Pre-EIS Submission Consultation Process Appendix 7.2-A Aboriginal Group Consultation
MFN-22.14	Requested that the EIS be amended to incorporate findings of finalized reports related to Musqueam current and traditional use.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "Justification of potential infringement of Musqueam's established Aboriginal right to fish is not required in the EIS guidelines. However, the Panel review process will be a good forum for Musqueam to describe their views and rationale on whether or not the project should proceed. The Crown will seek further discussion of such issues during Phase IV of the environmental assessment process, once the Panel has submitted its report."		
MFN-22.15	Requested a proper baseline for Musqueam CULRTP that permits measurable assessment of adverse effects of the project.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency did not request additional information regarding baseline information for Musqueam CULRTP since there is already some information provided in the EIS. Musqueam is encouraged to present their concerns to the Panel once the Panel has been appointed."	**Addressed in EIS Section 32.0:** A full list of information sources used to prepare EIS Section 32.2 existing conditions is presented in EIS Section 32.2.3, including but not limited to Project-specific information provided to the VFPA from Indigenous groups in direct consultation with the VFPA, and review of ITK and studies of Current Use, and traditional use.	**EIS** 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-22.16	Stated that the CEA Agency is requested to require the Proponent to provide a baseline for the distribution, populations, behaviour, and availability of wildlife, fish and flora of importance to Musqueam CULRTP, including those within the terrestrial environment.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency has requested additional information regarding baseline conditions in the Local and Regional Assessment Areas in its letter of July 31, 2015 to Port Metro Vancouver [the VFPA] (page 3, #9)."	**Addressed in Responses to IR-7.31.15-09 and AIR-12.04.15-09:** Responses to IR-7.31.15-09 and AIR-12.04.15-09, provide a characterisation, including the results of baseline surveys, of fish populations (e.g., marine invertebrates, fish, marine mammals and other marine animals) found in, or migrating through, the LAAs and RAAs.	**Information Requests** Response to Information Request #9 (IR-7.31.15-09 of CEAR Document #314) Response to Additional Information Request #9 (AIR-12.04.15-09 of CEAR Document #388)
MFN-22.17	Stated that at a minimum, the EIS will summarize available information on the potential or established Aboriginal and Treaty rights and related interests of the Aboriginal groups that have the potential to be adversely impacted by the project.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."	**Addressed in EIS Section 32.0:** A full list of information sources used to prepare EIS Section 32.2 existing conditions is presented in EIS Section 32.2.3, including but not limited to Project-specific information provided to the VFPA from Indigenous groups in direct consultation with the VFPA, and review of ITK and studies of Current Use, and traditional use.	**EIS** 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes
MFN-22.18	Stated that the table in Appendix 29-F repeats the flawed conclusion that a proposal to "Work towards a draft Terms of Reference to guide future discussions related to accommodation for effects from the Project" is a form of environmental mitigation which will eliminate any and all residual effects related to project-related displacement of Musqueam harvesters from areas of preferred use. Stated that this flawed assumption has, in turn, led to failure of the EA to undertake a cumulative effects assessment on Musqueam CULRTP. Both errors in the EA lead to conclusion that greatly underestimates cumulative effects on Musqueam CULRTP.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to Mort Metro Vancouver's methodology to inform its sufficiency review."	**Additional information provided by the VFPA:** The VFPA has reviewed this letter and understands it to be directed to the CEA Agency. The VFPA has no further information to provide.	
MFN-22.19	Requested that EIS sub-section 32.3.3 be amended for Musqueam so that reference to a proposal to, "Work towards a draft Terms of Reference to guide future discussions related to accommodation for effects from the Project", is removed as a form of mitigation. Stated that there has been a complete failure to provide a justification of the proposed infringement of Musqueam's established Aboriginal right to fish as required by the Sparrow decision of the Supreme Court of Canada.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency did not request additional information for this item. The Panel will determine whether it requires additional information or clarification with respect to Port Metro Vancouver's [the VFPA] methodology to inform its sufficiency review. Additionally, justification of potential infringement of Musqueam's established Aboriginal right to fish is not required in the EIS guidelines. Musqueam is encouraged to raise these issues with Panel."	**Additional information provided by the VFPA:** The VFPA has reviewed this letter and understands it to be directed to the CEA Agency. The VFPA has no further information to provide.	

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-22.20	Requested project-specific and cumulative effects assessment on Musqueam ability to harvest these species of concern. Requested an explanation as to how the Crown justifies the proposed infringement of Musqueam's established Aboriginal right to fish.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency did not request additional information for this item. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review. Additionally, justification of potential infringement of Musqueam's established Aboriginal right to fish is not required in the EIS guidelines. However, the Panel review process will be a good forum for Musqueam to describe their views and rationale on whether or not the project should proceed. The Crown will seek further discussion of such issues during Phase IV of the environmental assessment process, once the Panel has submitted its report."	**Additional information provided by the VFPA:** The VFPA has reviewed this letter and understands it to be directed to the CEA Agency. The VFPA has no further information to provide.	
MFN-22.21	Requested a proper assessment of residual adverse impacts to Musqueam rights and title, built on a foundation of a more effective consultation process with Musqueam. The infringement of Musqueam's Aboriginal right to fish must be justified.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency did not request additional information for this item. The Panel will determine whether it requires additional information or clarification with respect to Port Metro Vancouver's [the VFPA] conclusions to inform its sufficiency review. Additionally, justification of potential infringement of Musqueam's established Aboriginal right to fish is not required in the EIS guidelines."	**Additional information provided by the VFPA:** The VFPA has reviewed this letter and understands it to be directed to the CEA Agency. The VFPA has no further information to provide.	
MFN-22.22	Requested an assessment (project-specific and cumulative) of the effects of project components (including physical works and activities) on Musqueam's unceded Aboriginal rights and title.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency did not request additional information for this item since the EIS Guidelines did not require this analysis. The Panel will determine whether it requires additional information or clarification with respect to Port Metro Vancouver's [the VFPA] methodology to inform its sufficiency review. Discussions regarding are best considered during the Panel's sufficiency review."	**Additional information provided by the VFPA:** The VFPA has reviewed this letter and understands it to be directed to the CEA Agency. The VFPA has no further information to provide.	
MFN-22.23	Stated see comments related to EIS guidelines requirement 10.2, Adverse Impacts on Aboriginal and Treaty Rights and Related Interests Discharge by the Crown of its duty to justify the proposed	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency did not request additional information for this item. The Panel will determine whether it requires additional information or clarification with respect to	**Additional information provided by the VFPA:** The VFPA has reviewed this letter and understands it to be directed to the CEA Agency. #	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	infringement of Musqueam's Aboriginal right to fish. 10.2: The EIS does not assess potential adverse project-specific or cumulative impacts on Musqueam ability to harvest two clearly identified species of concern: sturgeon and eulachon. Under the Sparrow decision of the Supreme Court of Canada, any proposed infringement of Musqueam's Aboriginal right to fish must be justified by the Crown (including Port Metro Vancouver). A description of the infringements does not suffice to discharge this constitutional duty.		Port Metro Vancouver's [the VFPA] methodology to inform its sufficiency review. Additionally, justification of potential infringement of Musqueam's established Aboriginal right to fish is not required in the EIS guidelines. However, the Panel review process will be a good forum for Musqueam to describe their views and rationale on whether or not the project should proceed. The Crown will seek further discussion of such issues during Phase IV of the environmental assessment process, once the Panel has submitted its report.		
MFN-22.24	Requested a description of residual effects on Musqueam CULRTP, in particular, to marine harvesting.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to Port Metro Vancouver's [the VFPA] methodology to inform its sufficiency review."	**Addressed in EIS Section 32.0:** Descriptions of residual effects related to Current Use are described in EIS Section 32.0. Following implementation of mitigation, adverse residual Project-related effects are expected to be negligible. Therefore, the Project is not expected to contribute to cumulative effects.	**EIS** 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes
MFN-22.25	Requested that the Proponent work collaboratively with Musqueam to provide additional RBT2 site-specific and project development area ("Project Facility") data addressing Musqueam rights-based activities and associated CULRTP. Requested that the Proponent: 1. Work collaboratively with Musqueam to incorporate additional data, as described above, into a Project interaction matrix specific to Musqueam, showing the potential Project interactions, and related impact pathways of physical works and activities related to the proposed Project Facility with valued components and indicators related to Musqueam rights based activities and associated CULRTP. 2. Work collaboratively with Musqueam to characterize cumulative effects interacting with Project Facility residual effects on Musqueam rights and CULRTP. The study would apply Indigenous Traditional Knowledge (ITK) and archival methods to estimate pre-	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 32.0:** The VFPA committed to work with Musqueam First Nation to draft Terms of Reference to guide future discussions related to accommodation for effects from the Project. **Addressed in Response to IR10-12:** The VFPA's response to IR10-12, as requested by the Review Panel, further discusses the VFPA's approach to engagement and consultation with Indigenous peoples during and after the environmental review. **Additional information provided by VFPA:** The methodological approach used in the EIS and MSA are consistent with those in the Operational Policy Statement *Assessing Cumulative Environmental Effects* *Under the Canadian Environmental Assessment Act, 2012* issued by the CEA Agency.	**EIS** 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes **Information Requests** Response to Sufficiency Information Request #12 (IR10-12)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	industrial baseline conditions, and identify a trajectory of change over time for specific VCs integral to Musqueam rights-based activities (e.g., fisheries); and 3. Proponent to work collaboratively with Musqueam to identify effective mitigation measures tied to effect pathways identified in above effects assessments.				
MFN-22.26	Stated that there has been (1) no meaningful research into characterizing "current conditions" baseline information, (2) an absence of detailed analysis of Project impact pathways and adverse interactions with Musqueam rights-based activities, (3) flawed identification of mitigation, (4) flawed confidence estimations related to mitigation, and (5) incorrect analysis characterizing post-mitigation residual effects of the Project.	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in Responses to IR10-06 and IR10-13:** The VFPA's responses to IR10-06 and IR10-13, as requested by the Review Panel, provide additional information concerning the rationale for the current use effects assessment conclusions.	**Information Requests** Response to Sufficiency Information Request #06 (IR10-06) Response to Sufficiency Information Request #06 (IR10-13)
MFN-22.27	Stated that Section 32 is the primary vehicle through which the Proponent is intended to report credible information related to the effects of the Project on Aboriginal rights and associated CULRTP to the Panel and the Crown. To date, the Proponent has failed to do this.	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in Responses to IR10-02, IR10-06, IR10-08, IR10-13, and IR10-15:** The VFPA's responses to IR10-02, IR10-06, IR10-08, IR10-13, and IR10-15, as requested by the Review Panel, further discuss aspects of the current use effects assessment.	**Information Requests** Response to Sufficiency Information Request #2 (IR10-02) Response to Sufficiency Information Request #06 (IR10-06) Response to Sufficiency Information Request #08 (IR10-08) Response to Sufficiency Information Request #13 (IR10-13) Response to Sufficiency Information Request #15 (IR10-15)
MFN-22.28	Stated that the EIS has inappropriate reliance on the fish and fish habitat assessment as a "biophysical proxy" for rights. As noted by the Joint Review Panel (JRP) in relation to Site C, this approach incorrectly equates "no significant adverse effects" on species viability with the viability of Aboriginal harvesting and cultural activities without taking into account sufficiency of resources for the exercise of rights, preferred harvesting locations or methods, or the Aboriginal perspective.	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Appendix 7.2-B (#185):** The Project is not located on the Fraser River and no Project-related effects are predicted on the Fraser River. **Addressed in IR13-22:** The VFPA's forthcoming response to IR13-22 will further discuss potential Project effects on the quality and availability of preferred resources.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table **Information Requests** Response to Sufficiency Information Request #22 (IR13-22)
MFN-22.29	Stated that the EIS also fails to adequately consider adverse Project-specific and cumulative effects on Musqueam rights-based activities outside the Local Assessment Area	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Appendix 7.2-B (#185):** The Project is not located on the Fraser River and no Project-related effects are predicted on the Fraser River.	

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	(LAA) (i.e., impacts to fish that migrate into the mouth of the Fraser River).				
MFN-22.30	Concerned with the absence of acknowledgement and/or lack of detailed analysis of many Project impact pathways and adverse interactions with Musqueam Rights-based activities, and associated knowledge and quality of experience, including but not limited to the following, • Disruption of salmon, eulachon, white sturgeon and crab migration routes by construction and operation of Project footprint; • Disruption of salmon, eulachon, white sturgeon and crab life cycles by construction and operation of Project footprint; • Adverse effects on Musqueam fishery in the Fraser River due to Project specific and cumulative effects of industrial development on fishing resources present or migrating through Roberts Bank (e.g., juvenile salmon, crab and white sturgeon); • Impacts of further expansion of an "industrial precinct" with subsequent loss and disruption of social and cultural values associated with Roberts Bank and the Fraser River estuary; • Loss of viable habitat for shellfish resources through construction and operational displacement; • Exacerbation of existing patterns of alienation from traditional harvesting resources caused by industrial development on Roberts Bank, including navigational exclusion zones associated with the Project; • Decreased willingness and ability by Musqueam members to access the Project area due to perception of risk, reduced harvesting opportunities and aesthetic impacts; • Lost opportunities for the transmission of traditional knowledge and practices due to avoidance of industrialized area; • Disruptions to sense of place, identity and spirituality.	03-Nov-2016, Letter to Panel (CEAR Document #776)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 11.0, 12.0, 13.0, 14.0, 16.0, 21.0. and 32.0:** Project effect pathways and potential adverse interactions between the project and fisheries were considered in the EIS. The current use effects assessment presented in EIS Section 32.0 considered the results of effects assessments of potential Project and cumulative effects on marine vegetation, marine invertebrates, marine fish, marine mammals, coastal birds, marine commercial use, outdoor recreation, visual resources, land and water use, human health and archaeology and heritage resources, the ongoing productivity of commercial, recreational and Indigenous fisheries, as well the assessment of potential changes to air quality, noise and vibration, light and the assessment of potential accidents or malfunctions. The assessment concludes that following implementation of the mitigation, adverse residual Project-related effects are expected to be negligible. Therefore, the Project is not expected to contribute to cumulative effects. EIS Section 32.0 also considers Aboriginal and treaty rights. The effects assessment concludes the Project is not predicted to adversely impact the ability of Indigenous groups to exercise most asserted or established Aboriginal and treaty rights. The only exception is the harvesting of crabs for domestic or food, social or ceremonial purposes, it is predicted the Project would likely impact Musqueam First Nation's ability to exercise the treaty right to fish for crab for domestic purposes based on potential changes in access to a primary crab harvesting location. These effects are expected to be accommodated by the measures identified to avoid, reduce or otherwise address predicted effects on current use. **Additional information provided by the VFPA:** EIS Section 12.0 presents an effects assessment of marine invertebrates that considers crab and crab habitat. EIS Section 13.0 presents an effects assessment for marine fish that considers salmon, eulachon and sturgeon. As noted in EIS Appendix 7.2-B (#185), the Project is not located on the Fraser River and no Project-related effects are predicted on the Fraser River. EIS Section 21.0 presents an effects assessment of marine commercial use. EIS Section 32.0 assesses fish and seafood harvesting for food, social, ceremonial and domestic purposes by Indigenous groups, as well as potential alienation from traditional harvesting resources. **Addressed in Responses to IR 10-07 and IR10-14:** The VFPA's response to IR10-14, as requested by the Review Panel, further discusses potential economic implications of any permanent or temporary displacement related to the navigational closure, including in terms of sufficiency of resources at alternate locations to meet the requirements of the community. **Addressed in Response to IR10-08:** The VFPA's response to IR10-08, as requested by the Review Panel, further discusses potential changes in quality of the current use experience resulting from the proposed project.	**EIS** 11.0 Marine Vegetation 12.0 Marine Invertebrates 13.0 Marine Fish 14.0 Marine Mammals 16.0 Ongoing Productivity of Commercial, Recreational and Aboriginal Fisheries 21.0. Marine Commercial Use 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes **Information Requests** Response to Sufficiency Information Request #7 (IR10-07) Response to Sufficiency Information Request #08 (IR10-08) Response to Sufficiency Information Request #10 (IR10-10) Response to Sufficiency Information Request #14 (IR10-14) Response to Sufficiency Information Request #15 (IR10-15) Response to Sufficiency Information Request #22 (IR10-22)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				Addressed in Response to IR10-15: The VFPA's response to IR10-15, as requested by the Review Panel, further discusses potential effects to the quality of the Current Use experience resulting from marine shipping associated with the project. **Addressed in Response to IR10-22:** The VFPA's response to IR10-22, as requested by the Review Panel, further discusses the assessment of cultural heritage, potential disruptions or loss of ceremonial and cultural practices, as well as a potential disruption to sense of belonging, identity and spirituality.	
MFN-22.31	Concerned about immediate displacement of Musqueam from rights-based harvesting area. Stated that the Project will alienate us from our marine harvesting areas.	03-Dec-2015, Letter to Ministry of Environment and Climate Change, and Ministry of Transport Canada	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Appendix 7.2-B (#120):** In the Marine Commercial Use assessment, a residual effect is considered significant when all of the following conditions are met: • The effect occurs to a known area of commercial marine-based activity or potential; • The effect displaces or excludes commercial marine-based activities from a known use area; • There are associated adverse harvest or revenue effects due to the displacement; and • The displaced commercial marine-based activity cannot move to known alternative activity areas due to regulatory reasons. The Project is expected to result in a residual effect of changes to seafood harvesting area, harvest and revenue. This residual effect (related to the displaced crab harvesters) is determined to be not significant, however, as Dungeness crab are known to move substantial distances to baited traps, and harvest activity can be moved to another open area. The potential for an adverse effect related to changes in access to preferred Current Use locations for crab is discussed in EIS Section 32.2.6. With the implementation of mitigation measures (EIS Section 32.2.7), residual Project-related effects on Current Use are expected to be negligible (EIS Section 32.2.8).	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 12.0 Marine Invertebrates 21.0 Marine Commercial Use 21.7 Future Conditions with the Project – Potential Project-related Effects 21.10 Determination of Significance of Residual Adverse Effects Table 21-10 Summary of Determination of Significance of Residual Effects for Marine Commercial Use 24.0 Outdoor Recreation 24.6 Future Conditions with the Project – Potential Project-related Effects 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2.6 Current Use of Land and Resources for Traditional Purposes, Future Conditions with the Project – Potential Project-related Effects 32.2.7 Current Use of Land and Resources for Traditional Purposes, Mitigation Measures Current Use of Land and Resources for Traditional Purposes, Characterisation of Residual Effects and Context
MFN-22.32	Concerned about hundreds of additional vessel movements through or adjacent to our territorial waters.	03-Dec-2015, Letter to Ministry of Environment and Climate Change, and Ministry of Transport Canada	The VFPA has reviewed this letter and provides the following additional information.	**Additional information provided by the VFPA:** The VFPA acknowledges Musqueam's concern regarding additional vessel movements through or adjacent to their territorial waters. The MSA considers the potential effects of increased shipping traffic in the marine shipping area, including potential noise effects and the likelihood and consequence of accidents and malfunctions to fish and crab habitat and health. The conclusion of the MSA is that marine shipping associated with the Project is not likely to result in any significant adverse residual effects to any of the VCs assessed. In addition, no adverse cumulative effects are anticipated, with the exception of potential effects to SRKW. As with the	

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				conclusions in the EIS, submitted in March 2015, the MSA concludes that SRKW have already been significantly adversely affected by past projects and activities; therefore, cumulative effects are expected to remain significant.	
MFN-22.33	Concerned that the amount of area available for [hunting birds] is shrinking and access is more difficult; if flight path changes MFN may not be able to access them to hunt and to transfer knowledge; referred to exclusion zones and federal regulations and mapping preventing MFN from accessing areas for hunting. Noted studies undertaken before were done at the wrong times and with inadequate methodology. Noted MFN history of hunting ducks at night using fires at the front of canoes. Concerned about the avoidance of hunting and restrictions on hunting of waterfowl in the vicinity of the Project.	16-Jun-2017, Meeting with Administrative Staff 15-Nov-2017, Letter to Panel (CEAR Document #1098)	**16-Jun-2017, Meeting:** Stated that the VFPA and Musqueam could have a more detailed discussion on the bird studies. Referred to the Adaptive Management Program from DP3 and 6-8 years of bird detection and data collection being done.	**Addressed in EIS Section 32.2.6.2:** Minor decreases in overall bird productivity are predicted as a result of the Project. These predicted decreases are not expected to affect the ability of Musqueam First Nation to harvest these species in preferred areas. Musqueam has reported they have already been displaced from preferred areas closer to their main community and due to conservation concerns, can no longer harvest certain vitally important species (EIS Section 32.2.4.2). There may be an existing impairment to the exercise of asserted rights of Musqueam First Nation to hunt coastal birds due to the reported perceived decreases in the abundance of birds at Roberts Bank and existing hunting restrictions. The Project is not expected to impact the ability of the Musqueam First Nation to exercise the right to hunt coastal birds. **Addressed in Response to IR10-04:** The VFPA's response to IR10-04, as requested by the Review Panel, further discusses potential Project effects on wildfowl harvesting opportunities.	**EIS** 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes 32.2.6.2 Potential Effect 2: Changes in Availability of Preferred Current Use Resources 32.3.2.2 Potential Impacts on the Exercise of Asserted or Established Aboriginal Rights – Non-Treaty Aboriginal Groups **Information Requests** Response to Sufficiency Information Request #4 (IR10-04)
MFN-22.34	Expressed that Musqueam site-specific values were found to be most dense in the northern portion of the Study Area, especially around the site of the proposed RBT2 terminal and along the coast between the Project footprint and Point Grey, as well as inland along all arms of the Fraser River. Expressed that the significant industrialization of Roberts Bank that has occurred since 1959 has effectively alienated Musqueam harvesters from certain portions of Roberts Bank and surrounding waters.	15-Nov-2017, Letter to Panel (CEAR Document #1098)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in Response to IR10-08:** The VFPA's response to IR10-08, as requested by the Review Panel, further discusses potential changes in quality of the current use experience resulting from the proposed project.	**Information Requests** Response to Sufficiency Information Request #08 (IR10-08)
MFN-22.35	Concerned about the loss and disruption of historical, social, and cultural values associated with the avoidance of coastal harvesting activities due to pollution generated from marine shipping.	15-Nov-2017, Letter to Panel (CEAR Document #1098)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in Response to IR10-22:** The VFPA's response to IR10-22 as requested by the Review Panel, further discusses the assessment of cultural heritage, potential disruptions or loss of ceremonial and cultural practices, as well as a potential disruption to sense of belonging, identity and spirituality.	**Information Requests** Response to Sufficiency Information Request #22 (IR10-22)
MFN-22.36	Concerned about the exacerbation of the existing pattern of alienation from hunting resources caused by industrialization and settlement in Musqueam territory. Concerned that levels of pollution have reached levels where there is anxiety, concern, and even avoidance regarding	15-Nov-2017, Letter to Panel (CEAR Document #1098)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 32.2.6.3:** As outlined in Section 27.0 Human Health, new contaminant input as a result of Project construction or operation is not anticipated; consequently, the human health assessment predicts a negligible potential for direct human health effects from Project construction or operation based on toxicological risks associated with marine shellfish consumption, and specifically of edible bivalve tissue and Dungeness crab muscle. No mitigation measures are therefore identified.	**EIS** 11.0 Marine Vegetation 15.7.2.3 Coastal Birds, Productivity of Waterfowl 15.8 Mitigation Measures 32.2.6.3 Potential Effect 3: Changes in Quality of Preferred Current Use Resources

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	the consumption and harvest of waterfowl in Musqueam territory.			Section 27.0 Human Health also examines potential changes to stress and annoyance levels within the human health LAA as a result of perceived contamination of traditional food sources. As reported in that assessment members of Indigenous groups believe the Project has the potential to further contaminate traditional food sources in the area. This concern or fear has been reported as already affecting their stress and anxiety. Awareness and education measures, including future dissemination of the results of a Roberts Bank Dungeness Crab Health Study that is investigating the causes of black colouration observed under the shell of some crab harvested from Roberts Bank, have been identified in the human health assessment as mitigation to reduce adverse health outcomes due to traditional food avoidance. (See the VFPA's response to IR 4-33 and 4-34). Residual effects are anticipated to be negligible and are therefore not assessed further in the human health assessment. For all Indigenous groups, effects to the quality of Current Use resources are not anticipated as a result of Project construction or operation. The mitigation measures identified for other potential effects on Current Use and those proposed in the human health assessment related to perceived contamination will serve to alleviate concerns regarding perceived contamination risk. **Addressed in Response to (IR12-01):** The VFPA's forthcoming response to IR12-01, as requested by the Review Panel, considers Indigenous group avoidance of foods due to pollution or contamination (perceived or real).	**Information Requests** Response to Sufficiency Information Request #01 (IR12-01)
MFN-22.37	Concerned that Project-related marine shipping will lead to multigenerational exacerbation of the existing pattern of disruptions to cultural continuity caused by industrialization, settlement and institutional policies. Concerned that Project-related marine shipping will lead to disruption and constraint of ceremonial and spiritual practices dependent on access to and harvest of natural resources. Concerned that Project-related marine shipping will lead to lost opportunities for the transmission of traditional knowledge and practices, especially in the vicinity of the Project. Concerned that Project-related marine shipping will lead to disruptions to Musqueam members' sense of place, identity, and spirituality. Concerned that Project-related marine shipping will lead to disruptions to the social fabric of the community built from and around the practice and transmission of traditional activities. Concerned about the multigenerational exacerbation of the existing pattern of disruptions to cultural continuity caused	24-May-2016, Musqueam First Nation Marine Shipping Effects Assessment 20-Jun-2016, Meeting 15-Nov-2017, Letter to Panel (CEAR Document #1098)	**24-May-2016:** Recorded comment for consideration by the Project team. **20-Jun-2016, Meeting:** Recorded comment for consideration by the Project team. **30-Sep-2016, Letter from the VFPA:** Responded that comments have been included and incorporated in the AIMSA, and will also be submitted directly to the Review Panel and posted on the public registry. Enclosed AIMSA Appendix 2-B showing the issues raised by Musqueam First Nation and the VFPA's responses.	**Addressed in AIMSA – MFN and TWN Appendix 2-B (#24):** The assessment of Current Use considers existing disruptions, as well as potential effects of marine shipping associated with the Project on cultural continuity (e.g., transmission of ceremonial and spiritual practices, traditional knowledge, sense of place, identity, and other intangible heritage considerations) in the assessment of quality of Current Use experience in the MSA and AIMSA. This aspect of the Current Use assessment considers the connection between the transmission of intangible cultural heritage and, for example, access to and harvest of natural resources. **Addressed in AIMSA – MFN and TWN Section 7.3.5:** The potential effects of marine shipping associated with the Project within the marine shipping area on the Current Use, including intangible cultural heritage, of Musqueam First Nation may be summarised as follows: Negligible with respect to: • Change in access to preferred Current Use locations as a result of Project-associated ship wake; Minor with respect to: • Change in access to preferred Current Use locations as a result of Project-associated increases in ship pass-bys; and As the implementation of mitigation measures referred to in AIMSA Section 7.4 are expected to effectively address potential incremental effects to Current Use by Musqueam First Nation as a result of Project-associated vessel transit activities within the marine shipping area, residual effects from those activities on Current Use are expected to be negligible.	**MSA** 9.5 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights 9.5.5.1 Negligible Effects of Vessel Transit on Current Use **AIMSA – MFN and TWN** Appendix 2-B Aboriginal Issues and Interests 3.0 Human Health 3.2.2 Negligible Effects Related to Contamination in Edible Marine Resources 7.0 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights 7.3 Potential Interactions and Effects on Current Use **Information Requests** Response to Additional Information Request #10 (MSA IR-02.24.16-10 of CEAR Document #386) Response to Sufficiency Information Request #15 (IR10-15)

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	by industrialization, settlement, and institutional policies. Indicated that there are numerous areas at the Project site used for the inter- and intra-generational transfer of knowledge and skills that support the cultural continuity of the Musqueam Concerned about lost opportunities for the transmission of traditional knowledge and practices, especially in the vicinity of the Project. Concerned about disruptions to the social fabric of the community built from and around the practice and transmission of traditional activities. Concerned about the disruption and constraint of ceremonial and spiritual practices dependent on access to and harvest of natural resources. Concerned about disruptions to Musqueam members' sense of place, identity, and spirituality.			**Addressed in Response to MSA IR-10:** The response to MSA IR-10 further explains the approach to assessing potential effects of marine shipping associated with the Project on the cultural heritage aspects referenced in the concerns raised. **Addressed in IR10-15:** The VFPA's response to IR10-15, as requested by the Review Panel, further discusses potential effects to the quality of the Current Use experience resulting from marine shipping associated with the project. **Addressed in Response to IR10-22:** The VFPA's response to IR10-22, as requested by the Review Panel, further discusses the assessment of cultural heritage, potential disruptions or loss of ceremonial and cultural practices, as well as a potential disruption to sense of belonging, identity and spirituality.	Response to Sufficiency Information Request #22 (IR10-22)
MFN-22.38	Concerned that Project-related marine shipping will lead to decreased willingness and ability by Musqueam members to access the Project area due to Project-related marine traffic. Concerned about the decreased willingness and ability by Musqueam members to access the Project area due to Project-related marine traffic and increased regulations.	24-May-2016, Musqueam First Nation Marine Shipping Effects Assessment 20-Jun-2016, Meeting 15-Nov-2017, Letter to Panel (CEAR Document #1098)	**24-May-2016:** Recorded comment for consideration by the Project team. **20-Jun-2016, Meeting:** Recorded comment for consideration by the Project team. **30-Sep-2016, Letter from the VFPA:** Responded that comments have been included and incorporated in the AIMSA, and will also be submitted directly to the Review Panel and posted on the public registry. Enclosed AIMSA Appendix 2-B showing the issues raised by Musqueam First Nation and the VFPA's responses.	**Addressed in AIMSA – MFN and TWN Appendix 2-B (#25):** In relation to the marine shipping area, the assessment of Current Use (in the MSA and in the AIMSA) considers the potential effects on access to preferred Current Use locations in the marine shipping area and the quality of Current Use experience that could influence willingness to access those areas. In relation to the Project area, the assessment of Current Use in the EIS also assesses potential changes on access to preferred Current Use locations and the quality of Current Use experience that could influence willingness to access those areas. **Addressed in AIMSA – MFN and TWN Section 7.3.5:** The potential effects of marine shipping associated with the Project within the marine shipping area on the Current Use, including intangible cultural heritage, of Musqueam First Nation may be summarised as follows: Negligible with respect to: • Change in access to preferred Current Use locations as a result of Project-associated ship wake; and Minor with respect to: • Change in access to preferred Current Use locations as a result of Project-associated increases in ship pass-bys. As the implementation of mitigation measures referred to in AIMSA Section 7.4 are expected to effectively address potential incremental effects to Current Use by Musqueam First Nation as a result of Project-associated vessel transit activities within the marine shipping area, residual effects from those activities on Current Use are expected to be negligible.	**EIS** 32.2 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes **MSA** 9.5 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights 9.5.5 Potential Interactions and Effects of Vessel Transit on Current Use **AIMSA** Appendix 2-B Aboriginal Issues and Interests 7.0 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights 7.3.5 Summary of Potential Effects on Current Use **Information Requests** Response to Sufficiency Information Request #08 (IR10-08) Response to Sufficiency Information Request #15 (IR10-15) Response to Sufficiency Information Request #25 (IR13-25)

MFN-23.1	Requested information about the procurement policy.	19-Nov-2014, Health & Aboriginal Rights Workshop - MFN	**25-Nov-2014, Email from the VFPA:** The VFPA provided Musqueam with its Aboriginal Procurement policy and responded to Musqueam's question confirming that First Nations were not involved in the drafting of the policy. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in EIS Appendix 7.2-B (#145):** The VFPA's Aboriginal Procurement approach is part of the *Sustainable Procurement Guidelines* included in the Procurement Policy. All of the VFPA's corporate policies are approved by VFPA Board of Directors. The language used is based upon the Federal Aboriginal Procurement language used by various Federal departments. The language was developed by the VFPA's Procurement Administrator and subsequently approved by both VFPA Executive and Board of Directors and came into effect on January 13, 2013. The VFPA has shared the Aboriginal Procurement language below with several First Nations upon request. The definition of an Aboriginal Business is also included on VFPA's website in relation to the Aboriginal Business Directory. The language in the VFPA Procurement Policy currently reads as follows: The VFPA is committed to identifying greater development and employment opportunities for Indigenous entrepreneurs and businesses that may assist in building capacity within Indigenous communities. To be considered an Indigenous business the following criteria must be met: At least 51% of the business is owned and controlled by Indigenous people, and at least one third of the employees are Indigenous. If the business is a sole proprietorship, it must be wholly owned by an Indigenous person. In the case of a joint venture or consortium, at least 51% of the joint venture or consortium must be controlled and beneficially owned by an Indigenous business or businesses, as defined above. Additionally, at least one-third of the value of the work performed under a contract is completed by an Indigenous business, either by the Indigenous partner/contractor or by an Indigenous sub-contractor. In the spirit of satisfying the goals of this section, when entering into an agreement with an Indigenous business, the employment and development opportunities for Indigenous communities or members will be an important factor. The VFPA may, where the capacity/ability within the local Indigenous community is demonstrated, directly award a contract to that Indigenous business to assist in the development of the community and to foster improved communication with the Port. Where capabilities are known by more than one Indigenous business in the local community, a limited competitive process may also be followed. In accordance with the Procurement Policy, when single sourcing applies additional levels of approval must be obtained. For projects where it is deemed beneficial, proponents may be asked in the solicitation documents to demonstrate in their submission how Indigenous participation and representation will be met and maintained during the contract period. When considering sourcing options with an Indigenous business, consultation with the VFPA's Manager, Aboriginal Affairs and/or an Aboriginal Affairs Advisor is recommended.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table
MFN-23.2	Requested information regarding potential procurement, employment, training and skills development. Expressed an interest in seeing an early list of	27-Nov-2013, Meeting 07-May-2014, Interview 03-Jul-2014, VCs Workshop #2	**27-Nov-2013, Meeting:** Recorded comment for consideration by Project team. **07-May-2014, Interview:** Recorded comment for consideration by Project team.	**Addressed in EIS Section 32.3.3.1:** EIS Section 32.3.3.1 presents a summary of mitigation measures applicable to Indigenous peoples, including assisting in accessing potential economic opportunities resulting from the Project including contracting opportunities as well as construction employment opportunities.	**EIS** 32.3.3.1 Summary of Mitigation Measures for Potential Adverse Impacts on the Exercise of Asserted or Established Aboriginal and Treaty Rights

	these positions for planning purposes. Asked if jobs will be unionized. Expressed preference in long term employment. Interested in potential contracting opportunities. Requested additional information on the terminal operator.		**17-Nov-2014, Meeting:** The VFPA and Musqueam initiated employment, contracting and training discussions. **02-Nov-2015:** The VFPA released the names of five shortlisted teams to participate in the competitive process to select a Terminal Operator for the proposed Project: http://www.robertsbankterminal2.com/news-updates/terminal-operator-procurement/. **12-May-2016, Email from the VFPA:** Provided Musqueam with an Information Sheet on Employment Opportunities for RBT2.	**Additional information provided by the VFPA:** On 04-Sep-2018, the VFPA and Musqueam signed a RBT2 Negotiation Protocol Agreement. The VFPA and Musqueam agree to work together to negotiate in good faith a Mutual Benefits Agreement for the Project.	
MFN-23.3	Stated that the Project's impacts to Musqueam traditional use/ability to fish will require accommodation. Requested a % of revenue (benefit for length of the Project, not only a one time payoff) Requested to be a partner in RBT2, involved in planning and decision-making, long-term commitment to working with Musqueam.	18-Oct-2013, Meeting 29-Jun-2015, Meeting 12-Aug-2015, Meeting	**18-Oct-2013, Meeting:** Recorded comment for consideration by the Project team. **17-Nov-2014, Meeting:** The VFPA and Musqueam initiated employment, contracting and training discussions. **29-Jun-2015, Meeting:** Committed provide a draft framework or schedule for Mutual Benefits Agreement discussions. **12-Aug-2015, Meeting:** Provided a draft framework, discussed draft and identified areas for edits. **16-Oct-2015, Meeting:** Musqueam requested to push back discussion on the MBA until the New Year. **04-Nov-2016, Letter from the VFPA:** Expressed an interest in continuing discussions with the Musqueam regarding a Project Benefit Agreement. **22-Feb-2017, Letter from the VFPA:** Reiterated the VFPA's interest in resuming benefit agreement discussions related to the Project and sought confirmation of Musqueam's interest and availability to meet.	**Additional information provided by the VFPA**: On 04-Sep-2018, the VFPA and Musqueam signed a RBT2 Negotiation Protocol Agreement. The VFPA and Musqueam agree to work together to negotiate in good faith a Mutual Benefits Agreement for the Project.	

Table 24: Social and Economic Setting

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-24.1	Asked about the hiring process for a researcher associated with the socio-economic assessment. Expressed a preference for the Musqueam Education Coordinator to put forth candidates to be referred to VFPA HR (or alternate), following a job description. Concerned with the research ethics for the socio-economic study conducted for the Musqueam community. Stated that Musqueam considers it to be a poor quality document even with correction of errors.	27-Nov-2013, Meeting 30-Jan-2015, Meeting	**27-Nov-2013, Meeting:** Recorded comment for consideration by the Project team. **17-Dec-2013, Meeting:** The VFPA and Musqueam met to discuss a socio-economic study work plan, including the opportunity for involvement of a Musqueam researcher in the assessment. **07-Jan-2014, Letter from the VFPA:** The VFPA will work with Musqueam to put in place an agreed upon hiring process for a researcher associated with the Community and Socio-Economic Assessment. **06-Feb-2014, Email from Musqueam:** Musqueam indicated they approved the socio-economic study work plan and the VFPA could proceed in hiring a consultant and Musqueam Community Researcher. **21-Jan-2015, Email from the VFPA:** Followed up on Musqueam's review of the Golder Draft Socio-Economic Report. Stated that this draft was provided to Musqueam to ensure accuracy of content, to meet conditions of the Musqueam research permit and to obtain approval from Musqueam for inclusion of this report in the EIS. Requested comments as soon as possible so they could be addressed. **23-Jan-2015 and 27-Jan-2015, Email from Musqueam:** Musqueam provided edits to the draft Socio-Economic Report. **01-Feb-2015, Email from the VFPA:** Provided the revised and final document now entitled: RBT2, 18-B Existing Socio-Economic Conditions of the Musqueam First Nation Community. This report has incorporated the changes requested by Musqueam. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in EIS Appendix 7.2-B (#115):** In 2014, the Project team conducted research with Musqueam for an existing socio-economic conditions l study under the terms of a Research Permit titled "Musqueam Indian Permit to Conduct Research Within Musqueam Traditional Territory" (Permit Number MFN-14-112-MB). The VFPA worked to address Musqueam concerns regarding adherence to the research permit conditions. Musqueam First Nation reviewed a draft of the socio-economic existing conditions study, provided comments that were incorporated into the report, and provided consent to the VFPA to include the report as an appendix to the EIS.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 18.0 Social and Economic Setting Appendix 18-B Existing Social and Economic Conditions of Musqueam First Nation Community
MFN-24.2	Requested the following: 1. Conduct socio-economic effects assessment in a disaggregated fashion, separating out effects on Aboriginal and non-Aboriginal	15-Jun-2015, Letter to the CEA Agency (CEAR Document #241)	**15-Oct-2015, Letter from the CEA Agency:** "The Agency has requested that Port Metro Vancouver [the VFPA] provide an "assessment of effects of the Project on human health in a manner that differentiates between Aboriginal and non-Aboriginal people" in its letter of July 31,	**Addressed in Response to IR-7.31.15-28:** Table IR28-1 Summary of Health Effects Assessment for Aboriginal and Non-Aboriginal people and summarises how the relevant EIS sections address differential conditions and effects between the Indigenous and non-Indigenous populations, and provides a rationale for why aspects may	**Information Requests** Response to Information Request #28 (IR-7.31.15-28 of CEAR Document #314) Response to Sufficiency Information Request #7 (IR10-07)

	sub-populations and considering effects on each affected		2015 to Port Metro Vancouver [the VFPA] (page 13, #28).”	be presented together for those instances in which a distinction is not made. **Addressed in Responses to IR10-07, IR10-14, IR10-27, and IR10-28:** The VFPA’s responses to IR10-07, IR10-14, IR10-27, and IR10-28, as requested by the Review Panel, further discuss aspects of socio-economic conditions of Indigenous Peoples.	Response to Sufficiency Information Request #14 (IR10-14) Response to Sufficiency Information Request #27 (IR10-27) Response to Sufficiency Information Request #28 (IR10-28)

Table 25: Traffic / Transportation

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-25.1	Asked if the railways will be upgrading their operating procedures as part of this project. Stated that the railways do not always keep to regulations concerning the environment.	14-Nov-2012, Meeting	**14-Nov-2012, Meeting:** Stated that the VFPA does not have regulatory jurisdiction over the national railway system.	**Addressed in EIS Section 1.3.2.2:** Regulatory authority with respect to federal railway companies rests with Transport Canada, pursuant to the *Canada Transportation Act* and the federal *Railway Safety Act*. Provincial railway companies are regulated by the B.C. Minister of Transportation and Infrastructure, pursuant to the *B.C. Railway Act* and the *Railway Safety Act*. **Addressed in Response to IR6-16:** The VFPA's responses to IR6-16, as requested by the Review Panel, discusses regulation related to locomotive emissions and industry trends. **Addressed in Response to IR6-32** As noted in the VFPA's response to IR6-32, the VFPA is working with terminal operators and railway companies operating within VFPA jurisdiction to progressively reduce emissions from their operations, as it does not own or operate any cargo handling equipment (CHE), drayage trucks, or locomotives. The VFPA sets targets and objectives for emission reduction through its participation in the Northwest Ports Clean Air Strategy (NWPCAS). The objectives are developed collaboratively by the VFPA, the Port of Seattle, and the Port of Tacoma. Specific programs and initiatives are then developed by each port in partnership with terminal operators, shipping lines, and railways, where possible, to encourage the achievement of emission reductions.	**EIS** 1.3.2.2 Mandate and Jurisdiction **Information Requests** Response to Sufficiency Information Request #16 (IR6-16 of CEAR Document #1113) Response to Sufficiency Information Request #32 (IR6-32 of CEAR Document #1188)
MFN-25.2	Concerned with the availability of staging areas and parking for additional truck and employee vehicle traffic, noting that they will require a lot of space.	07-Oct-2014, Preliminary EIS Results Workshop #1	**07-Oct-2014, Workshop:** Stated that from the perspective of trucking, roads are regulated by the Province's Ministry of Transportation and Infrastructure (MoTI). The trucks will be at the depots that are currently used. It is explained that there are many different independent truck operators, and different companies who have their own lots, and only when they're going to a terminal to do a pick up/drop off, or to one of the distribution houses or off-dock facilities, are they on the road. The figure of 1850 is in reference to truck trips/calls, not the actual number of trucks. It is explained that Deltaport is currently a day shift operation, and truck operators are making 1 or 2 trips per day. With the expected extension into the afternoon and implementation of night gates, the trucks will be able to operate longer, with the number of trips increasing to 3 or 4. It is explained that additional trips do not mean that the VFPA is issuing additional licenses for additional trucks. Parking is provided on the terminal for workers' vehicles, next to the administration building. The VFPA stated that the number needs to be confirmed by referring to the drawings, but there is parking for 700 or 800 vehicles. The figure of 1750 refers to the number of vehicle movements/trips per day. It accounts for 3 work shifts, visitors, and also delivery vehicles who wouldn't be expected to require parking over long periods of time.	**Additional information provided by the VFPA:** The 700-800 parking comment the VFPA made on 07-Oct-2014 applies to combined parking for both DTRRIP and RBT2 CCIP projects. Approximately 550 after DTRRIP at Deltaport and approximately 340 for the semi-automated RBT2, both taking into account shift change additional parking requirements. **Addressed in EIS Appendix 7.2-B (#218):** The economic development assessment (EIS Section 20.0) considers economic effects in Metro Vancouver and B.C. related to an increase in trucking activity related to the Project. Environmental and social effects associated with Project-related increases in truck traffic on the causeway are considered in EIS Sections 9.2, 9.3, 23.0, 27.0, and 32.2. The VFPA will ensure the Infrastructure Developer and Terminal Operator will work with federal and provincial regulatory authorities and local governments, including B.C. MoTI, Corporation of Delta, BC Ferries, and Tsawwassen First Nation to develop the land-based portion of the Land and Marine Traffic Management Plan. The plan will provide for public and worker safety and the timely exchange of information regarding traffic management during Project construction, including traffic control measures, short-term traffic interruptions, and temporary road restrictions and re-routing with Tsawwassen First Nation, Corporation of Delta, Delta Police Department, Delta Fire and Emergencies Services, and B.C. Ambulance Services.	**EIS** 2.0 Project Overview 2.2.7 Project Context, Roberts Bank as a Terminal Location Appendix 7.2-B Aboriginal Groups Interests and Issues Table 9.2 Air Quality 9.3 Noise and Vibration 23.0 Services and Infrastructure 27.0 Human Health 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes 33.0 Environmental Management Program 33.3.7 Environmental Management Program, Land and Marine Traffic Management Plan 35.0 Effects Assessment Summaries Table 35-2 Proposed Mitigation Measures and Commitments

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			01-Apr-2015, Letter from the VFPA: Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response		
MFN-25.3	Asked about consultation with TFN, the municipality of Delta, and the Province's Ministry of Transportation and Infrastructure (MoTI) to accommodate additional traffic.	07-Oct-2014, Preliminary EIS Results Workshop #1	**07-Oct-2014, Workshop:** Stated that for trucking issues outside of the VFPA's jurisdiction, the VFPA has engaged as a partner in the Gateway Transportation Collaboration Forum, initiated earlier this summer with involvement from Transport Canada, the BC MoTI, Translink, and the Greater Vancouver Gateway Council. The VFPA has heard concerns about increased trucking, and the Forum is looking at four trade areas, the Roberts Bank Trade Area being the key one with respect to this Project. They're looking at what the potential future growth in the region will be, and its implications. The municipalities participate through working groups, similar to the Roberts Bank Rail Corridor Program that was initiated a number of years ago. It is noted the Program was developed with future RBT2 capacities in mind, but there's a need now to re-assess, identify, and fill in any gaps. Build Canada funds will be requested to address those gaps/concerns. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in EIS Appendix 7.2-B (#218):** The VFPA will ensure the Infrastructure Developer and Terminal Operator will work with federal and provincial regulatory authorities and local governments, including B.C. MoTI, Corporation of Delta, BC Ferries, and the Tsawwassen First Nation to develop the land-based portion of the Land and Marine Traffic Management Plan. The plan will provide for public and worker safety and the timely exchange of information regarding traffic management during Project construction, including traffic control measures, short-term traffic interruptions, and temporary road restrictions and re-routing with the Tsawwassen First Nation, Corporation of Delta, Delta Police Department, Delta Fire and Emergencies Services, and B.C. Ambulance Services. The Gateway Transportation Collaboration Forum (GTCF) was established in 2014 to identify and prioritise development of transportation and related infrastructure necessary for supporting continued gateway growth and to provide overall net benefits to host communities. It brings together Transport Canada, the B.C. MoTI, TransLink, the Greater Vancouver Gateway Council, and the VFPA to collaboratively pursue infrastructure solutions and funding opportunities under the New Building Canada Plan. The GTCF builds on the success of past initiatives, including the Roberts Bank Rail Corridor Program, South Fraser Perimeter Road, North Shore and South Shore Trade Area projects, Ashcroft Terminal's Expansion Project, and the Regional Transportation Management Centre. It was not created in relation to, nor is it in any way solely focused on, the Project. The GTCF consists of four trade areas, including the Roberts Bank Trade Area. The GTCF leverages existing reports and conduct new studies, as necessary, to guide identification and evaluation of regional projects that relate to additional truck and train traffic from increasing demand for trade through the gateway. The GTCF works in consultation with municipal governments, regional agencies, Indigenous groups, industry, and other stakeholders, to consider how best to meet long-term trade demand while reducing impacts to local communities and the environment. Much of this work will focus on addressing the increased truck and train traffic within Metro Vancouver that is anticipated as demand for trade through the gateway grows.	**EIS** 2.0 Project Overview 2.2.7 Project Context, Roberts Bank as a Terminal Location Appendix 7.2-B Aboriginal Groups Interests and Issues Table 9.2 Air Quality 9.3 Noise and Vibration 23.0 Services and Infrastructure 27.0 Human Health 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes 33.0 Environmental Management Program 33.3.7 Environmental Management Program, Land and Marine Traffic Management Plan 35.0 Effects Assessment Summaries Table 35-2 Proposed Mitigation Measures and Commitments

Table 26: Underwater Noise – Intermediate Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-26.1	Expressed uncertainty and lack of confidence in the thresholds established for effects of noise on salmon. Based on VFPA's assessment, fish will ignore sounds and keep swimming around the boats. Stated that Musqueam guarantees that even with one little boat the fish startle. It is actually used as a strategy to get fish into fishing nets. Concerned that there hasn't been enough work done on sound and impact. Stated that noise will impact a fish's direction. Fish aren't going to go near the boats. Concerned that even if they are not harmed, forcing them to move to a different area, will leave them open and exposed to different predation (for example in shallower or deeper water, to orcas or other species). Expressed uncertainty at the behavioural threshold established for eulachon (20m radius) is accurate, noting that impacts have been observed first-hand at greater distances.	19-Jul-2016, Issues Workshop - MFN / TFN #1 12-Sep-2016, Issues Workshop - MFN / TFN #2;	**19-Jul-2016, Workshop:** Responded that 20 m is the distance at which salmon would avoid sources of Project noise, which would be the behavioural threshold. Noise is never anticipated to be at a level that would cause injury. There might be localised areas that go over behavioural thresholds, but because it's so localised and because the source is moving or intermittent or not constant, it's a startle response. **12-Sep-2016, Workshop:** Stated that noise is also a function of vessel speed and proximity to shore. Noted Project-related vessels will be going slower in VFPA jurisdiction.	**Addressed in MSA Section 8.1:** Potential effects of underwater noise to fish and fish habitat was considered to be negligible because noise associated with Project-associated marine vessel activity and future cumulative shipping activities would not exceed injury thresholds for fish species or the Pacific salmon species behavioural threshold. Further, while noise-induced behavioural changes are possible for Pacific herring, potential effects would be localised to within 20 m of a container ship and of short duration (as the ship passes by) and are therefore not anticipated to affect the integrity of populations within the LAA. **Addressed in Responses to IR5-26 and IR5-27:** The VFPA's responses to IR5-26 and IR5-27 provide further rationale for the conclusions of the assessment of behavioural effects of underwater noise on juvenile Chinook and chum salmon.	**MSA** 8.1 Marine Fish and Fish Habitat **Information Requests** Response to Sufficiency Information Request #26 (IR5-26 of CEAR Document #1153) Response to Sufficiency Information Request #27 (IR5-27 of CEAR Document #1153)

Table 27: Visual Resources – Valued Component

#	Interest / Concern Raised	Date(s) and Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
MFN-27.1	Noted Brunswick Point is a place Musqueam people collect materials for ceremonial regalia and use as a classroom for the transfer of knowledge. Concerned about potential impacts to the sightlines of the location.	16-Jun-2017, Meeting with Administrative Staff	**16-Jun-2017, Meeting:** Recorded comment for consideration by the Project team.	**Addressed in EIS Section 25.0:** While the prominence of port-related structures is expected to increase from several viewscapes, the Project is not expected to result in a change in the overall quality of daytime visual resources, as the expected changes are consistent with the character of existing views of port facilities. Mitigation related to lighting design and operation, such as directing light only to where it is required and the use of a centralised light control system, is expected to reduce adverse effects on nighttime visual resources. However, the visibility of more light sources at night would not be fully mitigated, and would be a residual adverse effect for sites in the southern Gulf Islands. D-POR10 considered daytime visual resources at the Alaksen National Wildlife Area and N-POR7 considered nighttime visual conditions at Brunswick Point. In consideration of the similarity of the Project to the existing viewscape, the residual effect of the Project alone on visual resources is determined to be not significant. The Project is not expected to result in any significant residual adverse effects on visual resources. The Project is not expected to result in measurable incremental residual cumulative effects to visual resources.	**EIS** 25.0 Visual Resources

APPENDIX IR10-01-C3

SEMIAHMOO FIRST NATION: ISSUES, VIEWS, AND CONCERNS RELATED TO THE PROPOSED PROJECT AND MARINE SHIPPING ASSOCIATED WITH THE PROJECT

Table 1: Air Quality – Intermediate Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-1.1	Concerned that the Project will cause pollution.	04-Dec-2014, Health & Aboriginal Rights Workshop – Semiahmoo First Nation	**04-Dec-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#42):** An assessment was carried out to predict potential changes in air quality as a result of the Roberts Bank Terminal 2 Project (RBT2 or Project). The results of the air quality assessment were used in the assessments of human health and current use of lands and resources for traditional purposes (Current Use). The assessment concludes that: • Air quality will improve in the future, with or without the Project, as a result of improvements in engine technologies and the use of cleaner fuels. • Cumulative changes, incorporating the Project and other certain and reasonably foreseeable projects and activities, are predicted to be small relative to expected future ambient air quality levels. • Project construction activities are predicted to cause a small increase in concentrations of some contaminants. • Criteria air contaminant (i.e., carbon monoxide, nitrogen oxides, sulphur dioxide, particulate matter, and ground-level ozone) and trace organic contaminant (i.e., formaldehyde and other contaminants related to fuel combustion) levels are predicted to be below air quality criteria on land, with limited exceptions. • The Project is expected to have a negligible effect on future ozone levels and to increase greenhouse gas emissions (i.e., carbon dioxide, methane, and nitrous oxide). • Although Project activities would emit black carbon, black carbon is expected to decrease in the future with the Project due to equipment fleet turnover at existing Roberts Bank terminals to newer engines that meet more stringent emission standards for particulate matter. **Addressed in EIS Appendix 7.2-B (#55) (regarding potential contamination of marine sediment):** Dredging and disposal at sea (DAS)-related activities are described in the EIS and considered in the assessment of potential effects on marine physical and biophysical components. As described in the EIS, the physical and chemical characteristics of sediments that will be affected by construction activities, including sediments that will be re-suspended during dredging activities, were investigated and results were compared to recommended quality guidelines and regulatory criteria. DAS activities will occur subject to Environment Canada's DAS permit requirements under the *Canadian Environmental Protection Act, 1999*. Outcomes from the marine water quality assessment regarding total suspended sediment concentrations associated with dredging and dumping activities informed the assessment of marine vegetation, marine invertebrates, marine fish, marine mammals, coastal birds, ongoing productivity of commercial, recreational and Aboriginal fisheries, and outdoor recreation.	**Environmental Impact Statement (EIS, CEAR Document #181)** 9.2 Air Quality 9.6 Surficial Geology and Marine Sediment Appendix 9.6-C Dredging Studies – Dispersion Modelling 9.7 Marine Water Quality 11.0 Marine Vegetation 12.0 Marine Invertebrates 13.0 Marine Fish 30.0 Potential Accidents or Malfunctions Appendix 30-B Estuarine/Marine Fate of Spill-type Accidents

Table 2: Archaeological and Heritage Resources – Valued Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-2.1	Concerned with the cumulative effect of increased marine traffic and ship wake, leading to erosion of archaeologically significant areas in Semiahmoo First Nation's traditional territory. Stated that some archaeological sites have already become exposed. Concerned that no current study has been conducted on erosion in Semiahmoo Bay. Concerned that marine shipping is causing this effect. Stated that Semiahmoo Bay has eroded by 15 ft over three years - Less erosion in the channel, approximately 10 feet over 10 years. Concerned with exposed archaeological sites at Crescent Beach and further erosion to these areas.	06-Jun-2014, Valued Components Workshop #1 04-Dec-2014, Health & Aboriginal Rights Workshop – Semiahmoo First Nation 11-Jun-2015, Meeting	**06-Jun-2014, Workshop:** Recorded comment for consideration by the Project team. **29-Oct-2014, Aboriginal Groups EIS Workshop #4:** Impacts to archaeological sites related to the Project were discussed during the Aboriginal Groups EIS Workshop #4. **04-Dec-2014, Workshop:** Recorded comment for consideration by the Project team. **11-Jun-2014, Meeting:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **09-Nov-2015:** Provided a copy of the MSA, which included MSA Appendix 5-B that summarised Indigenous issues and interests and provided the Vancouver Fraser Port Authority's (VFPA's) response.	**Addressed in EIS Appendix 7.2-B (#48):** Coastal geomorphology (EIS Section 9.5) considers the physical processes such as waves and currents that change or maintain the physical environment of coastal areas. An assessment was undertaken to determine potential changes to coastal geomorphology as a result of the Project. **Addressed in MSA Appendix 5-B (#55):** The potential effects of vessel wake from marine shipping associated with the Project on archaeological sites (due to erosion) are addressed in MSA Section 9.4. The local assessment area (LAA) for the archaeological and heritage resources assessment includes the entire marine shipping area, including shorelines within Pacheedaht traditional territory, Semiahmoo Bay, and Crescent Beach. The potential effects on archaeological and heritage resources from vessel transit (marine shipping) are viewed as negligible because the only physical mechanism for effect, vessel wakes, are predicted to be within the natural variation in size of wind waves and would reflect only a small percentage of the annual maximum storm wave energy. The extent to which archaeological sites in the LAA have been (or may have been) affected to date by other projects and activities, including wake-wave effects of existing traffic, is not possible to determine because of insufficient data. Combined with the inability to measure any effect specifically attributable to marine shipping, it is not possible to identify the extent to which wake-related marine shipping effects contribute to any cumulative effect of the shipping associated with the Project in combination with other past or existing projects or activities. However, it can be confidently stated that the erosion of shoreline sites in exposed areas is mainly or wholly attributable to erosion from natural wave conditions, particularly seasonal storms occurring at high tides. **Addressed in MSA Appendix 5-B (#56):** The LAA for the assessment of archaeological and heritage resources (MSA Section 9.4) includes the shoreline of the San Juan and Gulf islands. The assessment of archaeological and heritage resources (MSA Section 9.4) describes existing conditions as they currently reflect cumulative changes to date from other projects and activities that have been carried out, as well as the impact of natural processes. As no measurable effects are predicted for archaeological and heritage resources related to ship wake and erosion from marine shipping associated with the Project, no mitigation is suggested and an assessment of cumulative effects has not been carried out. **Addressed in response to IR10-21:** The VFPA's response to IR10-21, as requested by the Review Panel, discusses potential Project effects to sites of physical and cultural importance to Indigenous peoples. **Addressed in response to IR10-23:** The VFPA's response to IR10-23, as requested by the Review Panel, discusses potential loss or deterioration of archaeological sites resulting from natural and ship-wake waves greater than 10 cm.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 28.0 Archaeological and Heritage Resources 28.3 Assessment Boundaries **Marine Shipping Addendum (MSA, CEAR Document #316)** Appendix 5-B Aboriginal Issues and Interests 9.4 Archaeological and Heritage Resources 9.4.5 Existing Conditions 9.4.5.1 Physical Environment 9.4.6.1 Negligible Effect #1 – Disturbance from Vessel Wake **Information Requests** Response to Sufficiency Information Request #21 (IR10-21) Response to Sufficiency Information Request #23 (IR10-23)
SFN-2.2	Expressed concern regarding the use of a hydro-vac during field monitoring and the risk of disturbing/displacing remains and artefacts. Emphasized their concern with sub-surface disturbance that may hinder determining the original location of archaeological artefacts and remains.	20-Sep-2017, Meeting	**20-Sep-2017, Meeting:** Recorded comment for consideration by the Project team.	**Addressed in EIS Section 28.0:** As noted in EIS Section 28.0, through mitigation, including excavation of test trenches prior to construction activities and the implementation of an Archaeological Monitoring and Management Plan (see EIS Section 33.0), potential damage to archaeological resources would be avoided, and the opportunity for future archaeological study would be protected.	**EIS** 28.0 Archaeological and Heritage Resources Assessment 33.0 Environmental Management Plan

Table 3: Coastal Geomorphology – Intermediate Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-3.1	Interested in whether coastal geomorphology studies were undertaken by the VFPA.	20-Dec-2013, Meeting	**20-Dec-2013, Meeting:** Responded that coastal geomorphology was studied. **08-Oct-2014, Preliminary EIS Workshop #2:** Described the existing conditions related to coastal geomorphology and anticipated future changes resulting from the Project components and activities. Provided an opportunity for feedback. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **03-Aug-2016, Issues Workshop – Métis Nation British Columbia, Semiahmoo First Nation, Tsleil-Waututh Nation:** Studies were discussed in greater detail during Spring and Fall workshops held in 2014, and additionally at the Issues Workshop held in August 2016, where the topic was included based on feedback from participants.	**Addressed in EIS Appendix 7.2-B (#48):** Coastal geomorphology considers the physical processes such as waves and currents that change or maintain the physical environment of coastal areas. An assessment was undertaken to determine potential changes to coastal geomorphology as a result of the Project. The assessment consisted of three study approaches to determine the potential effects of changes to natural processes from the Project footprint in subtidal and intertidal areas. Studies were informed by dialogue with the Coastal Geomorphology Technical Advisory Group. The results of the coastal geomorphology assessment were considered in the assessments of surficial geology and marine sediment, marine water quality, marine vegetation, marine invertebrates, marine fish, marine mammals, coastal birds, ongoing productivity of commercial, recreational, and Aboriginal fisheries, and archaeological and heritage resources. **Addressed in EIS Section 9.5:** EIS Section 9.5 presents an assessment of potential changes to coastal geomorphology as a result of the Project. Changes to coastal geomorphology are not expected from terminal development activities, but are related to the terminal footprint itself. The footprint would interact with tidal currents and wind-generated waves, resulting in localised alterations to sediment transport, sediment erosion and deposition, and freshwater and marine water flow exchange in the construction and operation phases. During causeway construction, drainage channels are expected to form on the intertidal flats adjacent to the causeway. This change would occur during construction only, and it is temporary and reversible. The VFPA would ensure the study and management of potential channel formation during the construction phase, and changes would be incorporated in detail design as required. Changes from the expansion of the tug basin include the conversion of local tidal flats to subtidal waters. Although the formation of additional tidal channels is not anticipated, a small increase in the size of an existing channel is likely. No incremental cumulative changes in coastal geomorphology are anticipated to result from the Project in combination with other projects and activities.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 9.5 Coastal Geomorphology Appendix 9.5-A Roberts Bank Terminal 2 Technical Report, Coastal Geomorphology Study
SFN-3.2	Concerned that sediments from Roberts Bank and the Fraser River will be taken by ocean currents to Semiahmoo First Nation territory and create problems for future development opportunities related to shellfish. Stated that spatial boundaries of the local assessment areas for coastal birds, marine fish, marine invertebrates, marine vegetation and biofilm, marine mammals and geomorphology should be inclusive of Boundary Bay and Semiahmoo Bay (and not stop at the international border).	06-Jun-2014, Valued Components Workshop #1 04-Dec-2014, Health & Aboriginal Rights Workshop – Semiahmoo First Nation 11-Jun-2015, Meeting 03-Aug-2016, Issues Workshop – Métis Nation British	**04-Dec-2014, Workshop:** Stated that EIS Section 9.6 includes an assessment of conditions in Boundary Bay but perhaps the study area is not high enough in the tidal zone so that is something that the VFPA will consider. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **03-Aug-2016, Workshop:** Stated that the numerical model ran up the Strait of Georgia and down into Washington State. Omitting certain areas would be impossible from a calculation perspective. The model calculates flows all the way through the Strait of Georgia; there is no boundary at the border. The local study area (the area that encompasses the expected changes to coastal geomorphology processes) contains a	**Addressed in EIS Appendix 7.2-B (#30):** The local study areas for coastal geomorphology, water quality, and surficial geology and marine sediment encompassed the anticipated maximum spatial extent where Project-related changes may occur. Sturgeon Bank and Boundary Bay were also included in the local study areas for marine water quality and for surficial geology and marine sediment. The local study areas extended south of the international border to Point Roberts, U.S.A. Measurable Project-related changes to sedimentation from construction activities or changes associated with altered coastal processes resulting from terminal placement are predicted to be localised at Roberts Bank. During the selection of LAAs for marine vegetation, marine invertebrates, marine fish, marine mammals, and coastal birds, the predicted extent of changes from any physical changes and the resultant anticipated effects to the valued components (VCs) and its sub-components were taken into consideration. Therefore, the selection of spatial boundary limits depends upon the area of anticipated Project effects, and the characteristics of the VC being assessed.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 9.0 Physical Setting 9.5 Coastal Geomorphology 9.5.8 Future Conditions with the Project Table 9.5-6 Predicted Morphological Changes from the Project Footprint Figure 9.5-35 Approximate Spatial Extent of Potential Changes Associated with the Project Footprint

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Asked whether the study would include the flow of currents from the Fraser to Semiahmoo Bay. Stated that no current study has been conducted that includes effects on Semiahmoo Bay. Stated that sediment from these areas ends up on the bank by Semiahmoo, which impacts shellfish, traditional foods.	Columbia, Semiahmoo First Nation, Tsleil-Waututh Nation	physical boundary that corresponds to the front of the delta where the shallow tidal flats drop steeply into deep water. This is because once you reach a certain depth, waves do not affect the bottom anymore. A hard boundary was not imposed, but sediment is only moving around in those intertidal zones and the tidal front. Changes based on the model do not go south of the Roberts Bank causeway, which acts as a physical barrier. Processes do not extend much toward the border. Tidal currents obviously go into Semiahmoo Bay; the border was not included in the model as a boundary since water flow and rates do not adhere to borders. Stated that the coastal geomorphology study included Boundary Bay and Semiahmoo Bay.		9.6 Surficial Geology and Marine Sediment 9.6.8 Future Conditions with the Project 9.7 Marine Water Quality 9.7.8 Future Conditions with the Project **MSA** Appendix 5-B Aboriginal Issues and Interests 10.0 Potential Accidents or Malfunctions Appendix 10-B Marine Fate of Shipping Spill-type Accidents
SFN-3.3	Concerned that sediment disposed of at sea as part of Project construction would end up in Semiahmoo Bay and that the Sediment study does not include the area south of the border. Requested a better understanding of how Disposal at Sea (DAS) affects crabs and other sea creatures, vegetation and the ecosystem. Interested in the VFPA returning with a coastal geomorphologist to respond to questions and speak to concerns regarding sediment from DAS activities entering Semiahmoo Bay; interest in also having DFO attend. Suggested meeting everyone (DFO, crab expert, fish expert, geomorphologist) at the same time to address Semiahmoo First Nation's questions and concerns. Concerned with dredging related to RBT2. Requested to meet with coastal geomorphologist.	01-Feb-2017, Meeting 21-Jul-2017, Meeting	**01-Feb-2017, Meeting:** Asked if it would be helpful for Semiahmoo First Nation to have a coastal geomorphologist attend a future meeting to respond to questions and discuss concerns in detail in the context of DAS, sediment, tides, and currents and undertook to plan such a meeting and include it in the Consultation Plan. **26-Jun-2017, Letter from the VFPA:** "The concerns brought forward by Semiahmoo First Nation with regard to Dungeness crabs and DAS highlighted the need for the VFPA to re-evaluate our planned construction approach and use of the intermediate transfer pit (ITP) as a part of the Project. The Project team has been actively exploring alternative construction methods to address concerns raised by Indigenous groups and regulatory agencies since the development of the EIS in 2014. After undertaking a thorough investigation that included further engineering work, consideration of new locally available dredging equipment, and relaxation of the *Coasting Trade Act* as a result of approving the Canadian European Trade Agreement, the port authority determined that the Project could proceed without the use of an ITP." **21-Jul-2017, Meeting:** The VFPA committed to arranging a meeting with Semiahmoo related to their sediment concerns. **07-Aug-2017, Email from the VFPA:** Asked to arrange a meeting with Semiahmoo and the Project geomorphologist. **20-Sep-2017, Meeting:** The VFPA met with Semiahmoo to discuss the Follow-up Program as well as their concerns regarding coastal geomorphology. The VFPA's consultant from Northwest Hydraulic Consultants was in attendance. Noted that the change in Project scope and no longer needed the ITP, will result in a Project that does not require a DAS permit.	**Addressed in PCU:** As requested by the Review Panel, the VFPA submitted the Project Construction Update (PCU) on June 12, 2018, providing: • Detailed revised Project description, including a revised construction schedule; • Revised Project interaction matrix; • Preliminary details pertaining to the management and timing of dredging activities and the discharge of sediment-laden water; and • Revised assessment of environmental effects as required by the Project modifications. Sections 1.0 and 2.0 of the PCU describe the changes to the EIS, including updates to specific construction activities, the construction schedule, and relevant Project description figures and appendices. In PCU Section 3.0, changes or effects resulting from the construction updates on intermediate components (ICs) and VCs are described. Overall, these changes to the environmental assessment resulting from construction updates can generally be summarised as follows: • Reductions in potential adverse changes or effects on ICs, biophysical VCs, social VCs, and Current Use; and • Increases in positive interactions with socio-economic VCs. These beneficial changes to ICs and VCs occur at the level of interactions or potential effects, and in most cases are slight changes, and thus do not affect the overall conclusions made in the EIS, including proposed mitigation, residual effect characterisations, significance determinations or cumulative effects, as applicable, with one exception. The only component predicted to have a change to residual effects is land and water use, with a reduction of a residual effect on access to Tsawwassen First Nation community lease lands from a measurable non-significant residual effect to a negligible residual effect, due to elimination of the ITP and associated activities.	**Project Construction Update (PCU; CEAR Document #1210** 1.0 Introduction 2.0 Revised Project Description and Schedule 3.0 Summary of Changes to the Environmental Impact Statement

Table 4: Effects Assessment Methods (including Cumulative Effects)

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-4.1	Asked if the VFPA will conduct a TERMPOL (Technical Review Process of Marine Terminal Systems and Transhipment Sites) for RBT2.	04-Dec-2014, Health & Aboriginal Rights Workshop – Semiahmoo First Nation	**04-Dec-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#10):** TERMPOL is a voluntary review process in which proponents involved in building and operating a marine terminal system for bulk handling of oil, chemicals, and liquefied gases can participate. A TERMPOL review was not required for the Project, as RBT2 is a proposed terminal that will handle containers only, not bulk fuel.	**EIS** 6.0 Environmental Assessment and Permitting Process Appendix 7.2-B Aboriginal Groups Issues and Interests Table
SFN-4.2	Concerned with the cumulative impacts of shipping on the Salish Sea. Asked how many more ships would be expected as a result of the Project. Expressed concern with increased vessel traffic travelling in/or through traditional territories. Noted the importance of looking at long-term cumulative effects including historical and future use. Concerned with the cumulative impacts on Semiahmoo First Nation since the existing port was built, including the loss of culture and traditions, traditional foods and shellfish harvesting.	20-Dec-2013, Meeting 07-Oct-2014, EIS Workshop 04-Dec-2014, Health & Aboriginal Rights Workshop – Semiahmoo First Nation 20-Sep-2017, Meeting	**20-Dec-2013, Meeting:** Stated that the EIS will include a cumulative effects assessment. **07-Oct-2014, Workshop:** The VFPA explained that it is estimated that the new marine terminal will receive 260 container ship calls (520 ship movements) per year by 2030, at which time the terminal is expected to be at full capacity. **04-Dec-2014, Workshop:** Stated that the information being presented is preliminary. The VFPA wants to share it with Semiahmoo First Nation prior to the studies being done and mitigation planning taking place so Semiahmoo First Nation's feedback can be considered before finalising the EIS. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **09-Nov-2015:** Provided a copy of the MSA, which included MSA Appendix 5-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in EIS Appendix 7.2-B (#35):** Reasonably foreseeable projects and activities related to marine shipping, including incremental marine vessel traffic associated with RBT2, is considered in the cumulative effects assessment. The potential cumulative effects of the Project in combination with other projects and activities that have been and will be carried out, including existing and future shipping, on Indigenous fisheries are discussed in EIS Sections 16.0, 21.0, and 32.2. **Addressed in EIS Appendix 7.2-B (#219):** The EIS considers the effects of Project-related traffic on Current Use and Aboriginal rights, and the cumulative effects of the Project in combination with other projects or activities, including existing and incremental marine vessel traffic. **Addressed in EIS Appendix 7.2-B (#157):** The methods used to assess the potential effects of the Project, including both residual effects of the Project and cumulative effects, are described in EIS Section 8.0. These methods are consistent with existing federal guidance. The effects of other projects and activities that have been carried out are reflected in the existing (and expected) conditions of the ICs and VCs, and in EIS Section 32.0. By assessing potential Project-related effects against those conditions, the cumulative effects of the Project and other past projects and activities are inherently considered. The EIS also includes historical data, where available and applicable, to assist interested parties to understand the potential effects, including cumulative effects, of the Project. The EIS does not include an assessment of historical infringements on the ability of Indigenous groups to exercise rights or impacts to traditional use. **Addressed in EIS Appendix 7.2-B (#183):** The Current Use assessment considers the quality of the experience of carrying out Current Use activities, which considers cultural aspects. The assessment of impacts on rights also considers cultural aspects and practices. The importance of traditional foods to culture and tradition is considered in the Current Use assessment (EIS Section 32.2). In response to AIR-12.04.15-29, on 19-Feb-2016, the VFPA provided explanation of how the potential Project-related effects on cultural heritage of Indigenous peoples was assessed in the EIS, providing additional clarification beyond the EIS where needed.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 8.0 Effects Assessment Methods Table 8-8 Project and Activity Inclusion List 8.1.9 Cumulative Effects Assessment 16.0 Ongoing Productivity of Commercial, Recreational, and Aboriginal Fisheries 21.0 Marine Commercial Use 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Lands and Resources for Traditional Purposes 32.3 Potential Adverse Impacts on Aboriginal and Treaty Rights and Related Interests Analysis **MSA** Appendix 5-B Aboriginal Issues and Interests 6.0 Effects Assessment Approach 6.7 Cumulative Effects Assessment 7.1 through 9.4 (All IC and VC assessments) 9.5 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				Addressed in MSA Appendix 5-B (#23): The approach to the cumulative effects assessment is provided in EIS Section 6.0. Each IC and VC assessment section considers cumulative changes and cumulative effects to which the Project contributes. This entails consideration of residual effects of routine marine shipping associated with the Project, if any such effects are predicted, in combination with effects of other projects and activities that have been or will be carried out. The assessment of Current Use (EIS Section 9.5) describes how Current Use activities have been affected by other projects and activities that have been carried out. As residual effects to Current Use as a result of marine shipping associated with the Project are not predicted, an assessment of future cumulative effects was not carried out. **Addressed in MSA Section 9.5:** MSA Section 9.5 considers Current Use by Indigenous peoples, including intangible cultural heritage considerations, and in the marine shipping area. The section also considers potential impacts on the ability to exercise asserted or established Aboriginal or treaty rights in the marine shipping area, including in the context of potential accidents and malfunctions. Both assessments consider the context of cumulative effects. In the MSA, cumulative effects were considered for each VC. **Addressed in response to IR4-09:** In the VFPA's response to IR4-09, updated project status and vessel movement information is provided as available for the projects listed in the EIS and MSA (north of Segment B), plus other new projects considered to be certain or reasonably foreseeable (as of July 1, 2017). **Additional information provided by the VFPA:** Transport Canada's letter to the Review Panel dated April 7, 2017 (CEAR Document #954), as well as its letter to the Review Panel dated December 20, 2017 (CEAR Document #1133), provides additional information on the Government of Canada's Oceans Protection Plan which includes information on the cumulative effects of marine shipping.	**Information Requests** Response to Additional Information Request #29 (AIR-12.04.15-29 of CEAR Document #388) Response to Sufficiency Information Request #09 (IR4-9 of CEAR Document #1051) **From Transport Canada to the Review Panel re: Overview of the Government of Canada's Oceans Protection Plan (CEAR Documents #954 and #1133)**
SFN-4.3	Expressed the belief that the VFPA should guarantee no adverse effects from the Project.	04-Dec-2014, Health & Aboriginal Rights Workshop - Semiahmoo First Nation	**04-Dec-2014, Workshop:** Recorded comment for consideration by the Project team.	**Additional information provided by the VFPA:** The methods used to assess and mitigate the potential effects of the Project are consistent with existing federal guidance, including the *EIS Guidelines* issued by the Canadian Environmental Assessment Agency (CEA Agency).	**EIS** 8.0 Effects Assessment Methods

Table 5: Engagement and Consultation

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-5.1	Expressed concern that the environmental assessment has missed the mark and concerned that Semiahmoo First Nation has now missed the opportunity for input into the EIS.	04-Dec-2014, Health & Aboriginal Rights Workshop - Semiahmoo First Nation	**04-Dec-2014, Workshop:** Responded that the environmental assessment is an ongoing process and the VFPA understands that it may get things wrong, and that is why these meetings and presentations are taking place. Explained that the CEA Agency will also ask Semiahmoo First Nation if they think the VFPA got it right and take Semiahmoo First Nation's input, and then so will the Panel. The VFPA may be asked to respond to the CEA Agency's concerns and the Panel will take all that information, as well as the EIS comments from Semiahmoo First Nation and others, and from all federal departments. Stated that the Panel will assess if there is enough info and then there would be the public hearings and once again they will check if the information is accurate. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#15):** Since January 2011, the VFPA has consulted with Indigenous groups regarding Project planning, components, and activities, selection of VCs, the potential effects of the Project, proposed mitigation measures, and potential changes to the environment related to the Project. The VFPA also held technical workshops with Indigenous groups at which the VFPA and technical specialists engaged directly with members of Indigenous groups, discussing specific areas of Indigenous interest and reviewing related technical topics. The intent of the fall 2014 workshops, as described in EIS Section 7.2.2 and detailed in EIS Appendix 7.2-A, was to provide preliminary EIS results and proposed mitigations and obtain feedback in a simplified presentation and plain language format. Materials were provided to Indigenous groups approximately two weeks in advance of workshops, to provide time to read the material so that questions and comments could be raised in the workshops. The VFPA also provided an opportunity to provide further comment following the workshops. Most questions asked during consultation are addressed in EIS Appendix 7.2-B. Some questions, comments and requests were addressed at the workshops or through follow up communications. The process identified for responding to Indigenous interests and/or issues is provided in the EIS. **Additional information provided by the VFPA:** Since submitting the EIS in 2015, the VFPA has continued to meet with Indigenous groups to discuss their interests, concerns, and suggestions for potential mitigation measures. Semiahmoo First Nation participated in an Issues Workshop held in August 2016, where the topics of discussion were selected based on feedback from participants. As part of the review process for the Project, concerns and feedback may also be submitted directly to the review panel for consideration.	**EIS** 7.0 Engagement and Consultation 7.2.2 Pre-EIS Submission Consultation Process Appendix 7.2-A Consultation Activities by Aboriginal Group Appendix 7.2-B Aboriginal Groups Interests and Issues Table
SFN-5.2	Provided a budget for a Traditional Land and Marine Use Study (TLMUS) for RBT2. Asked if Semiahmoo First Nation could conduct their own traditional use study and if there would be support from the VFPA for this. Stated that Semiahmoo First Nation does not have the capacity to participate and that the capacity funding and	19-Jul-2013, Meeting 20-Dec-2013, Meeting 11-Jun-2015, Meeting	**19-Jul-2013, Meeting:** Confirmed that where there are gaps, the VFPA would be looking to obtain additional information and would definitely like to have further discussions with Semiahmoo First Nation regarding the scope of a potential study. Stated that the VFPA will be providing capacity funding for Semiahmoo First Nation's participation in RBT2 consultation, noting that this includes activities or review to date and looking at upcoming materials. **20-Dec-2013, Meeting:** Discussed the EIS section on traditional use and offered to fund Semiahmoo First Nation Traditional Use Study.	**Addressed in EIS Appendix 7.2-B (#18):** Since January 2011, the VFPA has consulted with Indigenous groups regarding Project planning, components and activities, selection of VCs, the potential effects of the Project, proposed mitigation measures, and potential changes to the environment related to the Project. Indigenous groups were also provided draft community profiles and rights and Current Use information for their review and comments. Feedback received was incorporated into the EIS. The VFPA also held technical workshops with Indigenous groups at which the VFPA and technical specialists engaged	**EIS** 7.0 Engagement and Consultation 7.2.2 Pre-EIS Submission Consultation Process Appendix 7.2-A Consultation Activities by Aboriginal Group Appendix 7.2-B Aboriginal Groups Interests and Issues Table

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Traditional Use Study funding provided by the VFPA is insufficient. Stated that Semiahmoo First Nation are continually meeting on the VFPA's projects with limited funding and conducting piecemeal studies. Requested funding to support Semiahmoo First Nation's consultation and review of Project materials. Requested a broader funding agreement with the VFPA.		Stated that the funding provided to Semiahmoo First Nation is the maximum allotted to any one Indigenous group under the VFPA's current budget line for RBT2. Responded that the request for additional funding would be passed on and revisited in January 2014. Stated that there will be additional funding for regulatory working groups; designed to facilitate participation in the regulatory process. **17-Mar-2014, Letter from the VFPA:** Offered Semiahmoo additional participation funding. **31-Mar-2014, Letter from Semiahmoo First Nation:** Accepted funding. **12-May-2014, Letter from the VFPA:** Offered Semiahmoo funding for a TLMUS. **30-May-2014, Letter from Semiahmoo First Nation:** Accepted funding. **09-Jul-2014, Letter from the VFPA:** Acknowledged receipt of signed funding agreement for TLMUS and requested study by 31-Aug-2014 in order to incorporate into the EIS. (The VFPA received the TLMUS from Semiahmoo on 18-Sep-2014.) **22-Aug-2014, Letter from the VFPA:** Offered Semiahmoo additional participation funding. **18-Sep-2014, Letter from Semiahmoo First Nation:** Accepted funding. **11-May-2015, Letter from the VFPA:** Offered Semiahmoo participation funding to support participation in Project-related consultation activities, including marine shipping study. **22-May-2015, Letter from Semiahmoo First Nation:** Accepted funding. **07-Mar-2016, Letter from the VFPA:** Offered Semiahmoo additional participation funding to support ongoing involvement in consultation activities. **23-Sept-2016, Letter from Semiahmoo First Nation:** Accepted funding. **27-Sept-2017, Letter from the VFPA:** Offered funding to support discussions of a Mutual Benefits Agreement. **29-Sept-2017, Letter from Semiahmoo First Nation:** Accepted funding. **04-Oct-2017, Letter from the VFPA:** Offered additional funding for participation in consultation activities for RBT2; null and void if not returned by November 21, 2017. **14-Dec-2017, Letter from Semiahmoo First Nation:** Received after null and void date. **21-Dec-2017, Letter from the VFPA:** Re-issued offer of additional funding for participation in consultation activities for RBT2; null and void if not returned by January 19, 2018.	directly with members of Indigenous groups, discussing specific areas of Indigenous interest and reviewing related technical topics. Participation funding agreements have been negotiated between the VFPA and Indigenous groups, either individually or through associations representing the Indigenous groups, and were designed to support the consultation process for the Project. Additional agreements were reached to support Indigenous groups in the collection of Current Use information and Indigenous traditional knowledge (ITK) to inform Project planning, effects assessment, and identification of proposed mitigation measures. Throughout the consultation process, the VFPA has provided Indigenous groups with reasonable opportunities to present and communicate their interests and issues in relation to the Project to both the VFPA and relevant regulatory agencies.	

Table 6: Environmental Assessment and Permitting Process

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-6.1	Requested to review the technical studies.	08-Oct-2014, Preliminary EIS Workshop #2 04-Dec-2014, Health & Aboriginal Rights Workshop - Semiahmoo First Nation	**18-Jun-2014, Letter from the VFPA:** Provided a list of the Technical Reports (TRs) and Technical Data Reports (TDRs) carried out as part of the assessment. Stated that the VFPA is prepared to provide summaries of the TDRs and TRs to interested Indigenous groups, pending the signing of a confidentiality agreement. **08-Oct-2014, Workshop:** Responded that the final versions of the studies are not all complete. Stated that they will all be included in the EIS. **04-Dec-2014, Workshop:** Stated that the information being presented is preliminary. Stated that the VFPA is looking for feedback from Semiahmoo. **01-Apr-2015, Letter from the VFPA:** Provided Semiahmoo First Nation with the EIS, which contained all relevant technical studies.		
SFN-6.2	Commented that current environmental conditions are unacceptable and further projects should not go forward until existing problems are fixed.	11-Jun-2015, Meeting	**11-Jun-2015, Meeting:** Recorded comment for consideration by the Project team. **09-Nov-2015:** Provided a copy of the MSA, which included MSA Appendix 5-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in MSA Appendix 5-B (#25):** Decisions on Project approval will be made by the federal and provincial governments following recommendations by the independent review panel.	**MSA** Appendix 5-B Aboriginal Issues and Interests

Table 7: Human Health – Valued Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-7.1	Asked if there are studies related to shellfish contamination in Semiahmoo Bay.	04-Dec-2014, Health & Aboriginal Rights Workshop - Semiahmoo First Nation	**04-Dec-2014, Workshop:** Stated that the shellfish assessment included clams, cockles, and mussels at Roberts Bank and Boundary Bay. Boundary Bay was used as a reference point because it was further from the Project area. The VFPA collected samples from parts of Boundary Bay. We can give you more information on what was studied. The Human Health Risk Assessment (HHRA) looked at whether the current levels of various chemicals in edible crab tissues, mussels or bivalve tissues are acceptably low relative to human thresholds. There are currently no plans to do additional studies beyond what has been done in the HHRA. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS for the proposed Project, including EIS Appendix 7.2-B, which provides responses to questions raised by Semiahmoo First Nation. **01-May-2017, Email from the VFPA:** Hemmera, on behalf of the VFPA, plans on conducting a study in May or June 2017 to measure contaminant levels in shellfish collected at Roberts Bank. The study will consist of collection of Dungeness crab and Macoma clams from three locations at Roberts Bank, and laboratory analysis for a suite of contaminants including polychlorinated biphenyls (PCBs), polycyclic aromatic hydrocarbons (PAHs), and trace elements. This study, in conjunction with past shellfish studies, will further strengthen the existing understanding of shellfish contaminant levels at Roberts Bank. **12-Apr-2018, Letter from the VFPA:** Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the following documents for review: • IR4-33 - Crab Hepatopancreas Additional Study Summary; and • IR4-34 - Black Crab Additional Studies Summary. Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.	**Addressed in EIS Appendix 7.2-B (#134):** The focus of the Shellfish Harvesting Potential and Contaminant Related Consumption Risks study was port-related contaminants at Roberts Bank, and the information gathered on contaminants in crab muscle and edible bivalve tissues for the areas sampled at Roberts Bank were specifically intended to capture worst-case conditions based on historical and current port activities. Bivalve shellfish samples were collected in intertidal areas at Roberts Bank, from the BC Ferries Terminal in the south to Canoe Passage in the north, and included Boundary Bay as a reference site. The Dungeness crab study area encompassed shallow subtidal areas at Roberts Bank, from the BC Ferries Terminal in the south towards Canoe Passage in the north, including a reference site near Canoe Passage. For both bivalve shellfish and crab, areas closer to the Westshore Terminals were the focus of sampling. The study focused on determining whether historical and current port activities on Roberts Bank are resulting in contaminant uptake to safe or unsafe levels. **Addressed in responses to IR4-34 and IR4-33:** Further information concerning the VFPA's investigations into 'blackened' crabs is provided in the VFPA's response to IR4-34. In summary, black lesions were observed on four of the five crabs collected by Indigenous harvesters. The black lesions were concluded to be consistent with chitinolytic shell disease, generically referred to as 'shell disease', a condition common to crab and other crustaceans. This disease is caused by a bacterial or fungal infection of an area where the outer layer of the shell has been previously damaged. Shell disease has not been linked to contamination. The disease is not specific to the Roberts Bank area and is present across the Pacific Northwest, including Alaska and B.C. and in Atlantic Canada. In its response to IR4-33, the VFPA provided results of the study. In summary: A crab hepatopancreas study was conducted at Roberts Bank to determine the concentrations of contaminants of concern in crab hepatopancreas in the LAA. In June 2017, Dungeness crab were collected from five traps placed at each of the three study locations (15 traps total). Twelve adult male crabs were harvested from each of the three sites (36 crab total). Samples were submitted under chain of custody to analytical laboratories accredited by the Canadian Association for Laboratory Accreditation (CALA) for the analysis requested. The analysis was completed in August 2017. Collectively, the results of a statistical comparison across sites indicate that the average concentrations of PCBs, coal indicator elements, arsenic compounds, and PAHs measured in hepatopancreas from crab collected from the RBT2 and ITP sites are not statistically higher than those measured in crab from the Canoe Passage reference site. This suggests that existing sediment and water quality in and around the existing terminal and proposed RBT2 terminal are not contributing to contaminant concentrations in crab hepatopancreas that are higher than levels found in crab hepatopancreas from the Canoe Passage reference site.	**EIS** Appendix 7.2-B Aboriginal Group Issues and Interests Table 27.0 Human Health Appendix 27-C Shellfish Harvesting Potential and Contaminant-related Consumption Risks at Roberts Bank **Information Requests** Response to Sufficiency Information Request #33 (IR4-33 of CEAR Document #1078) Response to Sufficiency Information Request #34 (IR4-34 of CEAR Document #946)
SFN-7.2	Asked whether the Human Health section looks at each Aboriginal group individually	04-Dec-2014, Health & Aboriginal	**04-Dec-2014, Workshop:** Responded that the team tried to look at that, but that there is limited information available.	**Addressed in EIS Appendix 7.2-B (#128):** The health assessment included a focus on Indigenous communities, and relied upon information from various consultation and engagement activities	**EIS** 7.0 Engagement and Consultation

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	and whether the gap between Aboriginal and non-Aboriginal populations was considered.	Rights Workshop - Semiahmoo First Nation	Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS for the proposed Project, including EIS Appendix 7.2-B, which provides responses to questions raised by Semiahmoo First Nation.	(described in EIS Appendix 7.2-A). It also relied upon written sources of information provided by Indigenous groups directly, as well as information from the First Nations Health Authority. Information about traditional food consumption was gathered through existing literature (summarised in EIS Section 27.0) as well as engagement activities (summarised in EIS Section 7.0). A summary of the traditional foods consumed by each Indigenous group is included in EIS Section 32.2. A discussion of study methods is included in the EIS, including a summary of the HHRA and health impact assessment (HIA). These studies relied on information provided directly from Tsawwassen First Nation during consultation and through a community well-being study provided to the VFPA, as well as other published information and data sources related to health in B.C. Indigenous communities. The human health assessment considered the subsistence food consumption of individual Indigenous groups, as summarised in EIS Section 32.2. This information was included in the evaluation of potential effects on food security, as well as health inequity. **Addressed in response to IR-7.31.15-28:** As noted in the VFPA's response to IR-7.31.15-28, (the EIS presents an assessment of the effects of the Project on human health in a manner that differentiates between Indigenous and non-Indigenous people. EIS Section 27.0 and EIS Section 32.2 address potential effects of the Project related to human health. Within the human health section, information is presented separately for both Indigenous and non-Indigenous populations, for both existing conditions and for effects of the Project on human health, except where those distinctions are not practical. Within the Current Use section, all information is pertaining to Indigenous populations. Table IR28-1 summarises how the relevant EIS sections address differential conditions and effects between the Indigenous and non-Indigenous populations, and provides a rationale for why aspects may be presented together for those instances in which a distinction is not made.	7.2.2 Pre-EIS Submission Consultation Process Appendix 7.2-A Consultation Activities by Aboriginal Group Appendix 7.2-B Aboriginal Group Issues and Interests Table 27.0 Human Health 27.4 Information Sources 27.4.2 Desktop and Field Studies 27.5.7 Food Security 27.6 Future Conditions with the Project – Potential Project-related Effects Appendix 27-A Air Quality HHRA Technical Report; Appendix 27-B Noise and Vibration HHRA Technical Report 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes **Information Requests** Response to Information Request #28 (IR-7.31.15-28 of CEAR Document #314)
SFN-7.3	Commented that it is unacceptable to maintain the status quo with cumulative impacts to traditional foods from port activities. Stated that current proposed mitigation measures for health effects resulting from the Project are insufficient. Requested prevention and restoration measures to enable the shellfish fishery to be re-opened. Stated their concerns regarding cumulative effects to Semiahmoo First Nation traditional territory and their food security.	20-Dec-2013, Meeting 04-Dec-2014, Health & Aboriginal Rights Workshop – Semiahmoo First Nation 20-Sep-2017, Meeting	**20-Dec-2013, Meeting:** Responded that studies are being undertaken that consider health and well-being. **04-Dec-2014, Workshop:** Referred to additional information having been provided in the Onsite Habitat Mitigation Options presentation made at workshop #1 (07-Oct-2014). Responded that as a result of predicted loss of habitat, the VFPA has plans to do habitat compensation. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS for the proposed Project, including EIS Appendix 7.2-B, which provides responses to questions raised by Semiahmoo First Nation. **16-Jun-2017, Email from the VFPA:** The VFPA is interested in initiating discussions with Semiahmoo First Nation regarding potential legacy benefits from the Project. Legacy benefits are intended to benefit Indigenous groups if the Project	**Addressed in EIS Appendix 7.2-B (#139):** The EIS provides an assessment of potential Project-related effects on shellfish harvesting, and proposes mitigation for the specific adverse effects expected to directly or indirectly result from the Project. This includes measures to avoid, reduce or offset potential effects by: • Placing marine terminal in subtidal waters to eliminate direct effects to intertidal habitats; • Minimising causeway widening and optimising the footprint within the upper intertidal zone; • Rounding of the northwest terminal corner to reduce the potential area of scour; • Incorporating rocky shoreline in portions of the terminal perimeter and causeway perimeters; • Creating onsite habitat, including eelgrass, intertidal marsh, mudflat, and sandy gravel beach; and • Implementing various Construction Environmental Management Plans (EMPs) and Operation EMPs. Further details on mitigation measures for potential Project-related effects on marine invertebrates are included in the EIS. **Addressed in EIS Section 32.2:**	**EIS** Appendix 7.2-B Aboriginal Group Issues and Interests Table 11.0 Marine Invertebrates 16.0 Ongoing Productivity of Commercial, Recreational, and Aboriginal Fisheries

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			proceeds, and would be over and above the economic benefits resulting from the Project. Examples of types of legacy benefits are: restoring fisheries, training, funding cultural initiatives, enhancing environmentally sensitive areas, or revitalising aquaculture. It is our intent to develop this concept into a plan that reflect the interests, objectives, and priorities of Indigenous groups involved in the RBT2 Project. We welcome input regarding potential legacy benefits for Indigenous groups that could be provided as part of the Project. With that in mind, we request a meeting with Semiahmoo First Nation to hear about your community's priorities in relation to this funding. **21-Jul-2017, Meeting:** Met with Semiahmoo to discuss the legacy benefits. Discussed how funds are proposed to be allocated for environmental protection and aquatic revitalisation. Requested input regarding potential legacy benefits for Indigenous groups that could be provided as part of the Project. **20-Sep-2017, Meeting:** Noted that the VFPA is working on crab mitigation measures, and provided a summary on proposed mitigation measures to date. **12-Apr-2018, Letter from the VFPA:** Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the RBT2 Crab Mitigation Summary Overview, which detailed the following: • Mitigation measures to avoid or reduce effects to crab as outlined in the EIS; and • Additional crab harvesting related mitigation measure suggestions under review. Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.	Examines potential Project-related and cumulative effects that are relevant to traditional food consumption and nutritional health. These potential effects are related to access to preferred locations for harvesting preferred food resources, availability of preferred food resources, and quality of preferred food resources. Based on information considered in the Current Use assessment (EIS Section 32.2), there are no anticipated residual effects to most traditional food sources, including marine vegetation, marine fish, coastal birds, marine mammals, and most marine invertebrates, including bivalve shellfish and Dungeness crab.	
SFN-7.4	Interested in food security and health studies on the different nutritional value between traditional foods and store-bought foods. Concerned with the lack of access to traditional foods. Many of the most prevalent chronic diseases in the Semiahmoo First Nation	20-Dec-2013, Meeting 04-Dec-2014, Health & Aboriginal Rights Workshop - Semiahmoo First Nation	**20-Dec-2013, Meeting:** Stated that studies are being undertaken that consider health and well-being. **04-Dec-2014, Workshop:** Stated that the difference in nutritional value between traditional foods and store-bought foods was taken into account directly and indirectly. For example, when examining the effects of the Project on fish, those fish species that are important from a traditional food and Indigenous perspective, were a	**Addressed in EIS Appendix 7.2-B (#150):** The human health assessment of potential Project-related effects on food security considered the difference in nutritional value between traditional foods and store-bought foods in that a reduction in consumption of traditional foods, as compared to store bought alternatives, would be considered an adverse health effect, due to the high nutritional value of traditional foods. **Addressed in MSA Appendix 5-B (#52):** The assessment of potential effects of marine shipping associated with the Project on marine fish and fish habitat (MSA Section 8.1) addresses potential effects on the availability of marine resources. The assessment of human health	**EIS** Appendix 7.2-B Aboriginal Group Issues and Interests Table 27.0 Human Health 27.5.7 Food Security 27.6.1 Rationale for Determination of Negligible Effects

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	community may be linked to loss of traditional foods.	11-Jun-2015, Meeting	focus: Chinook, coho, and other salmonid resources. There was also a focus on invertebrates, in particular those that provide traditional food. **01-Apr-2015, Letter from the VFPA:** Provided the EIS for the proposed Project, including EIS Appendix 7.2-B, which provides responses to questions raised by Semiahmoo First Nation. **11-Jun-2015, Meeting:** Acknowledged this concern, and stated that it is important for Semiahmoo First Nation to note where Current Use is restricted, or lower than desired, and it can be taken into account in the VFPA's assessment. Committed to bring this concern back to the team.	(MSA Section 9.1) includes consideration of consumption of marine resources. The assessment of Current Use (MSA Section 9.5) also addresses the potential effects on availability of, and ability to harvest, marine resources. **Addressed in response to IR-7.31.15-28:** In response to IR-7.31.15-28, on 26-Oct-2015 the VFPA provided Table IR28-1 that summarises how the relevant EIS sections address differential conditions and effects between the Indigenous and non-Indigenous populations, and provides a rationale for why aspects may be presented together for those instances where a distinction is not made. **Addressed in response to IR-7.31.15-31:** In response to IR-7.31.15-31, on 26-Oct-2015 the VFPA provided an explanation of how the assessments in the EIS were based on the best available sources of information related to food reliance, as relevant to the identified pathways of effects from the Project. In response to AIR-7.31.15-31, on 19-Feb-2016 the VFPA provided information on the efforts made to gather additional information on country food reliance specific to each of the Indigenous groups listed in the *EIS Guidelines*.	27.6.5 Potential Effect #4 – Adverse Health Outcomes due to Changes in Health Inequity **MSA** Appendix 5-B Aboriginal Issues and Interests 8.1 Marine Fish and Fish Habitat 9.1 Human Health 9.5 Current Use of Lands and Resources for Traditional Purposes and Aboriginal and Treaty Rights **Information Requests** Response to Information Request #28 (IR-7.31.15-28 of CEAR Document #314) Response to Information Request #31 (IR-7.31.15-31 of CEAR Document #314) Response to Additional Information Request #31 (AIR-12.04.15-31 of CEAR Document #388) Appendix AIR31-A Summary of Reliance on Country Foods by Aboriginal Group
SFN-7.5	Commented that the data describing food security/insecurity, purchasing power, traditional food consumption, and anticipated residual effects to human health is overgeneralized and does not accurately reflect Semiahmoo First Nation or the Aboriginal population. Commented that the finding that the residual effects to human health are not significant.	04-Dec-2014, Health & Aboriginal Rights Workshop - Semiahmoo First Nation	**04-Dec-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided the EIS for the proposed Project, including EIS Appendix 7.2-B, which provides responses to questions raised by Semiahmoo First Nation.	**Addressed in EIS Appendix 7.2-B (#128):** The health assessment included a focus on Indigenous communities, and relied upon information from various consultation and engagement activities (described in EIS Appendix 7.2-A). It also relied upon written sources of information provided by Indigenous groups directly, as well as information from the First Nations Health Authority. Information about traditional food consumption was gathered through existing literature (summarised in EIS Section 27.0) as well as engagement activities (summarised in EIS Section 7.0). A summary of the traditional foods consumed by each Indigenous group is included in EIS Section 32.2. A discussion of study methods is included in the EIS, including a summary of the HHRA and HIA. These studies relied on information provided directly from Tsawwassen First Nation during consultation and through a community well-being study provided to the VFPA, as well as other published information and data sources related to health in B.C. Indigenous communities. The human health assessment considered the subsistence food consumption of individual Indigenous groups, as summarised in Section 32.2. This information was included in the evaluation of potential effects on food security, as well as health inequity. **Addressed in EIS Appendix 7.2-B (#149):** The following are highlights of the human health assessment: • Seven potential mechanisms for human health effects were assessed: air emissions, noise and vibration, shellfish contamination, stress and annoyance, employment and income, food security, and health inequity;	**EIS** 7.0 Engagement and Consultation 7.2.2 Pre-EIS Submission Consultation Process Appendix 7.2-A Consultation Activities by Aboriginal Group Appendix 7.2-B Aboriginal Groups Issues and Interests Table 27.0 Human Health 27.4 Information Sources 27.4.2 Desktop and Field Studies 27.5.7 Food Security 27.6 Future Conditions with the Project – Potential Project-related Effects Appendix 27-A Air Quality HHRA Technical Report Appendix 27-B Noise and Vibration HHRA Technical Report 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current Use of Lands and Resources for Traditional Purposes

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				• Potential Project-related effects on human health are expected to be fully or partially mitigated through the implementation of EMPs and additional mitigation measures; • The Project is not expected to result in any significant adverse residual effects on human health; and • The Project is not expected to result in measurable incremental residual cumulative effects to human health. With mitigation, all potential Project-related effects are expected to be negligible (not measurable), with the exception of residual effects on human health related to exposure to air emissions during construction, and exposure to noise during construction and operation. These effects are predicted to be not significant. A rationale for the determination is provided in EIS Section 27.0. **Addressed in response to IR-7.31.15-28:** In response to IR-7.31.15-28, on 26-Oct-2015 the VFPA provided Table IR28-1 that summarises how the relevant EIS sections address differential conditions and effects between the Indigenous and non-Indigenous populations, and provides a rationale for why aspects may be presented together for those instances in which a distinction is not made.	32.2 Current Use of Land and Resources for Traditional Purposes **Information Requests** Response to Information Request #28 (IR-7.31.15-28 of CEAR Document #314) Table IR28-1 Summary of Health Effects Assessment for Aboriginal and Non-Aboriginal People

Table 8: Labour Market – Valued Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-8.1	Concerned about the scope or methods of the labour market and economic development studies, particularly the exclusion of Indigenous members and/or communities located outside the Metro Vancouver region.	21-May-2015, Meeting	**21-May-2015, Meeting:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided the EIS for the proposed Project, including EIS Appendix 7.2-B, which provides responses to questions raised by Semiahmoo First Nation.	**Addressed in EIS Appendix 7.2-B (#111):** The LAA for labour market and economic development was defined as Metro Vancouver. The LAA was structured to capture the Project's potential labour market and economic development effects that will occur locally and are measurable or detectable. While there may be members of Indigenous groups located outside of Metro Vancouver that participate in one or more aspects of Project employment, or other economic effects, the effects on the labour market and economies of these Indigenous groups were not considered to be measurable or detectable.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 19.0 Labour Market 19.3.1 Spatial Boundaries 20.0 Economic Development 20.3.1 Spatial Boundaries

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-9.1	Interested in the consultation process proposed in the EIS for addressing the potential displacement of harvesters as a result of the Project. Asked whether the consultation process would take place through the VFPA or DFO.	03-Aug-2016, Issues Workshop – Métis Nation British Columbia, Semiahmoo First Nation, Tsleil-Waututh Nation	**03-Aug-2016, Workshop:** Stated that consultation could take place through a number of mechanisms. One being considered involves the VFPA working with DFO regarding commercial and recreational harvesters. Stated that a separate consultation component related to Indigenous harvesting (non-commercial and non-recreational) could take place in parallel. Stated that it is anticipated that a number of consultation mechanisms will be put into place. **12-Apr-2018, Letter from the VFPA:** Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the RBT2 Crab Mitigation Summary Overview, which detailed the following: • Mitigation measures to avoid or reduce effects to crab as outlined in the EIS, and • Additional crab harvesting related mitigation measure suggestions under review. Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area. Discussions are ongoing.	**Addressed in EIS Appendix 7.2-B (#119):** The EIS describes potential effects on fishing activity (EIS Sections 21.0 and 24.0) and effects in other areas (e.g., Boundary Bay) that are not otherwise directly affected by the Project but that may be affected by displacement are considered in EIS Section 32.2. Mitigation measures to reduce effects on outdoor recreation include: • Working with DFO to engage with recreational crab harvesters to identify and implement feasible mitigation measures; and • Implementing construction EMPs related to construction phase communication and crab salvages. Mitigation measures to reduce effects on marine commercial use include: • Working with DFO to engage with commercial crab harvesters to identify and implement feasible mitigation measures; and • Implementing construction and operation EMPs related to construction phase communication, construction monitoring and crab salvages.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 21.0 Marine Commercial Use 21.7.1 Seafood harvesting - Mitigation Measure #1 - Changes in Area, Harvest and Revenue 24.0 Outdoor Recreation 24.7.1 Recreational Seafood Harvesting Mitigation Measure #1 – Changes in Harvesting Area Use and Displacement 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes

Table 10: Marine Fish – Valued Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-10.1	Concerned with ship strikes to returning salmon.	11-Jun-2015, Meeting	**11-Jun-2015, Meeting:** Recorded comment for consideration by the Project team. **09-Nov-2015:** Provided a copy of the MSA, which included MSA Appendix 5-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in MSA Appendix 5-B (#38):** The assessment of potential effects of marine shipping associated with the Project on marine fish, including salmon, is included in MSA Section 8.1. Physical disruption or vessel strikes of salmon are not anticipated to be a form of interaction between marine shipping and marine fish, and therefore these aspects are not included in the assessment.	**MSA** Appendix 5-B Aboriginal Issues and Interests 8.1 Marine Fish and Fish Habitat 8.1.6 Potential Interactions and Effects
SFN-10.2	Concerned that the assessment study area for salmon stops at the American border and excludes Semiahmoo Bay, where Semiahmoo First Nation historically practiced reef net fishing. Stated that historically it is understood that salmon entered/held in Semiahmoo Bay before migrating up the Fraser River.	03-Aug-2016, Issues Workshop – Métis Nation British Columbia, Semiahmoo First Nation, Tsleil-Waututh Nation	**03-Aug-2016, Workshop:** Stated that a similar concern regarding sockeye using Roberts Bank as a holding area, has been brought up and looked into. The current understanding of sockeye migration is that most fish enter the Fraser River through the northern route at Johnstone Strait. A smaller portion (the diversion rate) comes up through Juan de Fuca Strait. The holding area is quite large; evidence of a defined and discrete area upon which boundaries can be applied could not be found. The holding area includes the Sunshine Coast, the Gulf Islands, the port area, Point Roberts, Semiahmoo Bay. It is an expansive area that the fish mill about in before heading up the river. From a Project effects perspective, the Project footprint itself is a tiny portion of this expansive area and what is known about sockeye on their return migration is that they tend to enter the river with little or no delay. Taken together, this suggests limited potential for interaction with holding salmon. Stated that the VFPA believes the EIS has captured potential interactions with sockeye and the Project; the EIS considers changes in habitat, geomorphology, light, water quality, acoustic profile. The VFPA believes that the pathways that would affect sockeye as they are holding is captured and considered in the EIS. The VFPA referred to Traditional Knowledge (TK) workshops held with Musqueam First Nation and Tsawwassen First Nation. Requested Semiahmoo share information on the holding area and specific sources to be considered if it is available.	**Addressed in EIS Appendix 7.2-B (#30):** During the selection of Local Assessment Areas (LAAs) for marine vegetation, marine invertebrates, marine fish, marine mammals, and coastal birds, the predicted extent of changes from any physical changes and the resultant anticipated effects to the VC and its sub-components were taken into consideration. Therefore, the selection of spatial boundary limits depends upon the area of anticipated Project effects, and the characteristics of the VC being assessed. **Addressed in EIS Section 13.3.1:** Description of the LAA for marine fish: • Roberts Bank, from the north side of the BC Ferries Terminal causeway to Canoe Passage, and from the high-water mark seaward to -100 m depth CD; • Includes all areas where Project-related effects (direct or indirect) to marine fish are expected to occur, and is based on life history information and spatial extent of Project-related influences (e.g., zones of acoustic effect or disturbance, TSS levels, sediment dispersion predictions); • Project-related effects on marine fish are not expected to extend into U.S. waters; as such, the LAA does not extend across the U.S. border; and • Localised spatial and temporal movements of focal groups or species have been considered based on general life history information, current and past data from Roberts Bank, and traditional use information. Description of the regional assessment area (RAA) for marine fish: • The Fraser River estuary from Boundary Bay to Sturgeon Bank and from the high-water mark seaward to -100 m CD, plus the Fraser River North and Main arms and main stem to Hope; and • DFO Pacific Fisheries Management sub-areas included are 29-6 to 29-17, waters of the Pitt River bounded by sub-area 29-15 are also included. **Addressed in response to AIR-12.04.15-10:** In response to AIR-12.04.15-10, on 19-Feb-2016 the VFPA provided Appendix AIR10-A - Table 1, which lists local and regional fish habitat maps by VC and sub-component (or representative species in some cases) included in the EIS. The VFPA also provided Appendix AIR10-B, which illustrates habitat features for Pacific salmon at a regional scale (i.e., within the marine fish RAA and beyond into the Strait of Georgia). The response may be accessed on the CEA Agency Registry for the Project: https://www.ceaa-acee.gc.ca/050/document-eng.cfm?document=107580	**EIS** Appendix 7.2-B Aboriginal Issues and Interests Table 13.0 Marine Fish 13.3.1 Spatial Boundaries Table 13-3 Spatial Boundary Definitions for Marine Fish **Information Requests** Additional Information Request #10 (AIR-12.04.15-10 of CEAR Document #388) Appendix AIR10-A - Table 1 Local and Regional Fish Habitat Maps by Valued Component Appendix AIR10-B - Figure AIR10-1 Important Areas for Pacific Salmon in the LAA, RAA, and Strait of Georgia

Table 11: Marine Invertebrates – Valued Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-11.1	Concerned with contamination to marine invertebrates caused by coal dust.	04-Dec-2014, Health & Aboriginal Rights Workshop - Semiahmoo First Nation	**04-Dec-2014, Workshop:** Recorded comment for consideration by the Project team. **07-Aug-2014, Email from the VFPA:** Stated that the VFPA is undertaking a study related to black material observed in Dungeness crabs previously harvested from the Fraser River estuary. This black material has been noticed by Tsawwassen and Musqueam First Nation crabbers in DFO Fisheries Management Areas 28 and 29 and as such we are working with these communities in the collection of crabs for testing. **01-Apr-2015, Letter from the VFPA:** Provided the EIS for the proposed Project, including EIS Appendix 7.2-B, which provides responses to questions raised by Semiahmoo First Nation. **09-Jul-2015, Letter from the VFPA:** Provided Semiahmoo with a memo detailing the results of black crab testing. The memo provided the conclusions of the study: • There is no evidence of coal contamination, based on the results of sensitive tissue chemistry analysis testing for PAHs, metals, and trace elements; • Consumption risks are acceptably low and pose no risk to human health; and • The underlying cause of the blackened shells is determined to be shell disease (a common condition due to bacterial infection of existing lesions or damage in the crab shells). **01-May-2017, Email from the VFPA to Semiahmoo First Nation: Shellfish Sampling and Analysis Study** Hemmera, on behalf of the VFPA, plans on conducting a study in May or June 2017 to measure contaminant levels in shellfish collected at Roberts Bank. The study will consist of collection of Dungeness crab and Macoma clams from three locations at Roberts Bank, and laboratory analysis for a suite of contaminants, including PCBs, PAHs, and trace elements. This study, in conjunction with past shellfish studies, will further strengthen the existing understanding of shellfish contaminant levels at Roberts Bank. **12-Apr-2018, Letter from the VFPA:** Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders.	**Additional information provided by the VFPA:** The proposed Project is a container terminal and does not include any coal-related elements. The Project will not contribute to coal dust. **Addressed in EIS Appendix 7.2-B (#74):** Potential Project-related effects on Dungeness crabs are described in the EIS. An Edible Shellfish Study was undertaken to quantify bivalve shellfish and Dungeness crab soft tissue contaminant concentrations. The results of this study are provided in the EIS in the marine invertebrates and human health sections. In late 2014, samples of crab were collected by Indigenous crab harvesters concerned about contamination, and the VFPA has submitted these for tissue testing for various substances of concern, including PAHs, metals, and fungus. Preliminary observational results indicate that the cause of black colouration of crabs is consistent with shell disease, and not likely related to contamination from coal dust (EIS Appendix 27-C, Section 4.76). **Addressed in Appendix 7.2-B (#133):** Coal dust from Westshore Terminals (the existing coal terminal at Roberts Bank) was included in the characterisation of air quality existing conditions and the assessment of potential cumulative changes to air quality. Release of coal dust into the environment is not Project-related; however, re-suspension of sediments containing historical coal dust deposits may occur during the construction phase, potentially leading to short-term uptake of contaminants by both bivalve shellfish and Dungeness crab. To address concerns about the health of these species, studies on both bivalve shellfish (including clams) and Dungeness crabs examined the edible tissue concentrations of coal dust-derived contaminants (including PAHs and heavy metals). Results from lab analyses demonstrate that bivalve shellfish (including clams) do uptake PAHs found in the surrounding sediments; however, a HHRA found concentrations in edible tissues were not high enough to pose a consumption risk. The assumptions used to estimate the consumption risk (i.e., total Incremental Lifetime Cancer Risk (ILCR)) are relatively conservative: the maximum observed PAH tissue concentration and a very high annual shellfish consumption rate. The total ILCR for exposure to potentially carcinogenic PAHs was estimated to be approximately on the order of magnitude lower than 1 in 100,000, the valued considered by Health Canada and the B.C. Ministry of Environment to be an acceptable low risk potential. On this basis, it was concluded that PAHs in Roberts Bank edible bivalve tissues pose a negligible consumption human health risk. **Addressed in responses to IR4-34 and IR4-33:** Further information concerning the VFPA's investigations into 'blackened' crabs is provided in the VFPA's response to IR4-34. In summary, black lesions were observed on four of the five crabs collected by Indigenous harvesters. The black lesions were concluded to be consistent with chitinolytic shell disease, generically referred to as 'shell disease', a condition common to crab and other crustaceans. This disease is caused by a bacterial or fungal infection of an area where the outer layer of the	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 12.0 Marine Invertebrates 12.4.1 Desktop and Field Studies Table 12-4 Marine Invertebrates Studies to Support the Assessment 12.5.3 Existing Conditions, Dungeness Crabs 12.6.2 Future Conditions with the Project, Negligible Effects 27.0 Human Health 27.5.4 Exposure to Shellfish Contamination Appendix 27-C Shellfish Harvesting Potential and Contaminant-related Consumption Risks at Roberts Bank 27.6.4 Potential Effect # 3 – Adverse Health Effects due to Stress and Annoyance - Perceived Contamination Appendix 27-C Shellfish Harvesting Potential and Contaminant-related Consumption Risks at Roberts Bank **Information Requests** Response to Sufficiency Information Request #33 (IR4-33 of CEAR Document #1078) Response to Sufficiency Information Request #34 (IR4-34 of CEAR Document #946)

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			Provided the following documents review: • IR 4-33 - Crab Hepatopancreas Additional Study Summary; and • IR4-34 - Black Crab Additional Studies Summary Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.	shell has been previously damaged. Shell disease has not been linked to contamination. The disease is not specific to the Roberts Bank area and is present across the Pacific Northwest, including Alaska and B.C. and in Atlantic Canada. In its response to IR4-33, the VFPA provided results of the study. In summary: A crab hepatopancreas study was conducted at Roberts Bank to determine the concentrations of contaminants of concern in crab hepatopancreas in the LAA. In June 2017, Dungeness crab were collected from five traps placed at each of the three study locations (15 traps total). Twelve adult male crabs were harvested from each of the three sites (36 crab total). Samples were submitted under chain of custody to analytical laboratories accredited by the Canadian Association for Laboratory Accreditation (CALA) for the analysis requested. The analysis was completed in August 2017. Collectively, the results of a statistical comparison across sites indicate that the average concentrations of PCBs, coal indicator elements, arsenic compounds, and PAHs measured in hepatopancreas from crab collected from the RBT2 and ITP sites are not statistically higher than those measured in crab from the Canoe Passage reference site. This suggests that existing sediment and water quality in and around the existing terminal and proposed RBT2 terminal are not contributing to contaminant concentrations in crab hepatopancreas that are higher than levels found in crab hepatopancreas from the Canoe Passage reference site.	
SFN-11.2	Stated that Semiahmoo First Nation is having a hard time harvesting crabs. Worried that T2 may increase pressure on their crab resources further as more people harvest in their waters. Concerned that as a result of the Project, availability of fish and crab in the Project area will decrease, resulting in increased demand for fish and crab in Semiahmoo Bay and Boundary Bay, which are already constrained. Stated that due to overfishing, Semiahmoo First Nation cannot harvest enough salmon or crab, which negatively impacts diet and traditional practice and use.	23-Nov-2012, Meeting 25-Aug-2014, Meeting 03-Aug-2016, Issues Workshop – Métis Nation British Columbia, Semiahmoo First Nation, Tsleil-Waututh Nation	**23-Nov-2012, Meeting:** Recorded comment for consideration by the Project team. **25-Aug-2014, Meeting:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided the EIS for the proposed Project, including EIS Appendix 7.2-B, which provides responses to questions raised by Semiahmoo First Nation. **03-Aug-2016, Workshop:** Responded that to change harvesting locations from Roberts Bank to Boundary Bay, Area I licence holders would have to apply for an Area J licence. Licence holders have the ability to apply for an alternative location every five years. Stated that the potential for the moving of harvesters from Area I to J was considered in the EIS. Noted that there are consultative mechanisms proposed in the EIS to monitor that. Requested feedback and suggestions on how best to put that consultation mechanism into place. **12-Apr-2018, Letter from the VFPA:** Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the	**Addressed in EIS Appendix 7.2-B (#117):** Marine commercial use, or the use of marine waters and resources to generate revenue, has been identified as an important economic factor in local and regional communities, and for Indigenous groups. The marine commercial use assessment included four sub-components: • Seafood harvesting; • Marine fish harvesting; • Guided sport fishing; and • Marine-based tourism. Potential effects on marine commercial use include displacement of commercial crab harvesting during construction and operation, resulting in a potential change of harvesting area, total harvest, and revenue, due to the Project footprint and the proposed expansion of the area closed to commercial crabbing. The VFPA will work with DFO to engage commercial crab harvesters to identify and implement feasible mitigation measures, and will implement construction and operation EMPs related to construction phase communication, construction monitoring, and crab salvages effects from displacement of commercial crab harvesting during construction and operation. The Project is anticipated to result in a negligible effect to marine fish harvesting, guided sport fishing, and marine-based tourism. These negligible effects are related to changes in area, access, resource availability, and harvesting revenues.The Project is expected to result in a residual effect of changes to seafood harvesting area, harvest, and revenue. The residual effect is determined to be not significant, as Dungeness crab are known to move substantial distances to baited	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 12.0 Marine Invertebrates 16.0 Ongoing Productivity of Commercial, Recreational, and Aboriginal Fisheries 21.0 Marine Commercial Use 21.6 Future Conditions with the Project – Potential Project-related Effects 21.7.1 Seafood harvesting - Mitigation Measure #1 - Changes in Area, Harvest and Revenue 24.0 Outdoor Recreation 24.7.1 Recreational Seafood Harvesting Mitigation Measure #1 – Changes in Harvesting Area Use and Displacement 27.0 Human Health 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current Use of Lands and Resources for Traditional Purposes

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the RBT2 Crab Mitigation Summary Overview, which detailed the following: • Mitigation measures to avoid or reduce effects to crab as outlined in the EIS; and • Additional crab harvesting related mitigation measure suggestions under review. Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.	traps, and harvest activity can be moved to another open area. Other planned or reasonably foreseeable projects and activities would also displace crab harvesting, and this effect would combine with that of the Project to result in an incremental cumulative effect on commercial crab fishing. This adverse incremental cumulative effect is determined not to be significant. **Addressed in EIS Appendix 7.2-B (#119):** The EIS describes potential effects on fishing activity (EIS Sections 21.0 and 24.0) and effects in other areas (e.g., Boundary Bay) that are not otherwise directly affected by the Project but that may be affected by displacement are considered in EIS Section 32.2. Mitigation measures to reduce effects on outdoor recreation include: • Working with DFO to engage with recreational crab harvesters to identify and implement feasible mitigation measures; and • Implementing construction EMPs related to construction phase communication and crab salvages. Mitigation measures to reduce effects on marine commercial use include: • Working with DFO to engage with commercial crab harvesters to identify and implement feasible mitigation measures; and • Implementing construction and operation EMPs related to construction phase communication, construction monitoring, and crab salvages. **Addressed in EIS Appendix 7.2-B (#162):** Potential effects on access to traditional foods are addressed in EIS Section 27.0, in terms of potential effects on food security, stress and annoyance, and health inequity. These sub-components address the potential effects of the absence of a traditional food source from the diet. Potential effects related to access to traditional foods are also assessed in EIS Section 32.2.	32.2 Current Use of Land and Resources for Traditional Purposes 32.2.6 Future Conditions with the Project - Potential Project-related Effects
SFN-11.3	Stated that the DFO bivalve shellfish closure in Fisheries Management Area 29 is arbitrary, given that the Human Health Risk Assessment technical report on shellfish contamination determines shellfish are safe to eat.	04-Dec-2014, Health & Aboriginal Rights Workshop - Semiahmoo First Nation	**04-Dec-2014, Workshop:** Responded that this is outside the scope of the VFPA's effects assessment, and is DFO's regulatory jurisdiction. Noted that the VFPA understands the perception that sanitary shellfish closures are imposed arbitrarily, but that is part of a broader discussion outside the scope of the Project. **01-Apr-2015, Letter from the VFPA:** Provided the EIS for the proposed Project, including EIS Appendix 7.2-B, which provides responses to questions raised by Semiahmoo First Nation.	**Addressed in EIS Appendix 7.2-B (#136):** DFO determines the validity of shellfish closures. Food safety associated with edible bivalve consumption requires that the bivalve tissues be safe based on all three of the following: • General absence of toxins produced by harmful algal blooms that can result in paralytic shellfish poisoning (PSP) and amnesic shellfish poisoning (ASP); • General absence of microorganisms in the shellfish tissues (viruses, bacteria, protistans) that are potentially pathogenic to humans; and • Presence of trace elements (e.g., cadmium) and chemical contaminants such as petroleum hydrocarbon residues at levels lower than thresholds of unacceptable health risk if consumed by humans. The shellfish consumption risk assessment directly addresses the third of these factors. In contrast, the DFO Area 29 sanitary shellfish closure is driven largely by concerns associated with the second of these factors.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 27.0 Human Health Appendix 27-C Shellfish Harvesting Potential and Contaminant-related Consumption Risks at Roberts Bank: 5.1 Human Health Risk Assessment, Context

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-11.4	Concerned with impacts to eelgrass and resulting impacts to crabs. Noted the lack of eelgrass and shellfish, and their desire to fix the issue or see no impact not just mitigation of impacts.	25-Aug-2014, Meeting 20-Sep-2017, Meeting	**25-Aug-2014, Meeting:** Recorded comment for consideration by the Project team. **29-Oct-2014, Aboriginal Group EIS Workshop #3:** The preliminary assessment results for marine vegetation (including eelgrass) and marine invertebrates (including crabs) were discussed during Aboriginal Group EIS Workshop #3. **01-Apr-2015, Letter from the VFPA:** Provided the EIS for the proposed Project, including EIS Appendix 7.2-B, which provides responses to questions raised by Semiahmoo First Nation. **20-Sep-2017, Meeting:** Recorded comment for consideration by the Project team.	**Addressed in EIS Appendix 7.2-B (#68):** Potential effects on eelgrass habitat, as well as on crabs and other species that use eelgrass habitat, are described in the EIS. Eelgrass beds are highly productive habitats in the Roberts Bank ecosystem, serving numerous critical functions, such as food, shelter, and rearing habitat for numerous species. Eelgrass is a sub-component of the marine vegetation assessment. The assessment concludes that changes in productivity of eelgrass are predicted to be negligible (i.e., not measurable or detectable). Increases in productivity of eelgrass are anticipated with the implementation of standard management practices and EMPs, and the creation of onsite habitat. Approximately three hectares of native eelgrass will be established through transplants in the inter-causeway area.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 11.0 Marine Vegetation 11.6.3 Potential Effect – Changes in Productivity 12.0 Marine Invertebrates 12.6 Future Conditions with the Project 12.6.2 Negligible Effects 12.6.3 Potential Effect – Changes in Productivity 13.0 Marine Fish 13.6.2 Negligible Effects
SFN-11.5	Expressed their frustration with Semiahmoo Bay not being included in the study area for crabs.	20-Sep-2017, Meeting	**20-Sep-2017, Meeting:** Recorded comment for consideration by the Project team.	**Addressed in EIS Sections 8.0 and 12.3.1:** As noted in EIS Section 8.1.3, spatial assessment boundaries were identified for each VC based on the spatial characteristics of the Project and the VC (e.g., location, distribution, range), and the areas within which Project-VC interactions and effects are expected to occur. When determining the spatial boundary, the Project team also considered, as applicable, available community knowledge and ITK, information on current land and resource use by Indigenous groups, and other pertinent ecological, technical, social, and cultural considerations, as well as input from government, Indigenous groups, and the public. As noted in EIS Section 12.3.1, the marine invertebrates LAA (approximately 5,416 ha) was established to encompass the area within which the Project is expected to interact with, and potentially have an effect on, marine invertebrates. In determining LAA boundaries, consideration was given to the nature and characteristics of marine invertebrates, historical and current traditional use activities, as well as the maximum extent of potential adverse effects on marine invertebrates.	**EIS** 8.1.3 Establishment of Assessment Boundaries 12.0 Marine Invertebrates 12.3.1 Spatial Boundaries

Table 12: Marine Mammals – Valued Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-12.1	Shared information about grey whale sightings in White Rock.	28-Oct-2014, Preliminary EIS Workshop #3	**28-Oct-2014, Workshop:** Responded that they do occur, but they are not particularly common. **01-Apr-2015, Letter from the VFPA:** Provided the EIS for the proposed Project, including EIS Appendix 7.2-B, which provides responses to questions raised by Semiahmoo First Nation.	**Addressed in EIS Section 14.0:** The marine mammal sub-component, baleen whales, including grey whale, are represented by humpback whales in the marine mammals assessment.	**EIS** 8.0 Effects Assessment Methods 8.1.2 Selection of Valued Components Figure 8-1 Valued Component Selection Process Appendix 8-A Valued Component Selection Rationale 14.0 Marine Mammals
SFN-12.2	Asked what the conclusions were of the marine study on orcas carried out as part of the Deltaport Third Berth (DP3) Project. Asked about a study from DP3 that was submitted to BCEAO that stated that monitoring was occurring. Asked about a transient and local whale population study that looked at impacts on SRKW food and way of life. Remembered reading the report but can no longer find it. Stated that it was a submission from a biologist submitted during Deltaport Third Berth review.	06-Jun-2014, Valued Components Workshop #1 21-May-2015, Meeting 11-Jun-2015, Meeting 29-Jul-2015, Meeting 21-Jul-2017, Meeting	**06-Jun-2014, Workshop:** Responded that the VFPA has undertaken a number of orca studies over the years, and these studies are listed on the Project website. The Hemmera team is looking at all studies produced for the VFPA for past projects as part of the RBT2 environmental assessment. **01-Apr-2015, Letter from the VFPA:** Provided the EIS for the proposed Project, including EIS Section 14.4 Information Sources. **21-May-2015, Meeting:** Noted that an initial step for discipline leads was to look at all existing information, so if there was a particular report for DP3 it most likely would have been looked at. Committed to confirm. **11-Jun-2015, Meeting:** Followed up with Semiahmoo to gather more information on the referenced DP3 study. **29-Jul-2015, Meeting:** The VFPA Adaptive Management Strategy (AMS) annual reports on DP3 mitigations available at the following link: http://www.portvancouver.com/development-and-permits/status-of-applications/deltaport-third-berth-project/. **21-Jul-2017, Meeting:** Committed try and locate the study. **16-Aug-2018, Email from the VFPA:** Stated that the VFPA is uncertain about which document the commenter is referring to. However, all technical documents submitted to the B.C. Environmental Assessment Office (EAO) are posted to the EAO Project Information and Collaboration site: https://www.projects.eao.gov.bc.ca/project.	**Addressed in EIS Section 14.4:** As noted in EIS Section 14.4, information sources used in the marine mammal assessment included previous environmental assessments and monitoring reports (e.g., DP3) and ambient noise measurements (Stantec 2010); underwater noise predictive modelling study to determine the extent of the area of disturbance for southern resident killer whales in the vicinity of the vibro-densification and dredging activities (Jacques Whitford AXYS and JASCO Research Ltd. 2007a and 2007b, Jacques Whitford AXYS et al. 2007); and surveys for marine mammals conducted before and during construction from 2003 to 2008 (Triton Environmental Consultants Ltd. 2004, Stantec 2010). See EIS Section 14.13 for a full list of references related to the assessment of marine mammals.	**EIS** 14.0 Marine Mammals 14.4 Information Sources 14.13 References

SFN-12.3	Concerned with the commitments made as part of past projects are not monitored or addressed.	11-Jun-2015, Meeting	**11-Jun-2015, Meeting:** Recorded comment for consideration by the Project team. **20-Sep-2017, Meeting:** Met with Semiahmoo First Nation to discuss the Follow-up Program. The presentation provided lessons learned on DP3, including the DP3 Marine Mammals monitoring work. The VFPA also included a proposed approach to developing the RBT2 Follow-up Program.	**Addressed in EIS Section 33.5:** An adaptive management approach will be taken as indicated in EIS Section 33.5. The VFPA's Follow-up Program will be developed in consultation with federal agencies, including the CEA Agency, DFO, and Environment and Climate Change Canada. Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on the program and approving agencies have an opportunity to evaluate and comment on the program. Feedback from Indigenous groups regarding the draft program will be sought through the VFPA's ongoing engagement initiatives. The VFPA is committed to developing and implementing a Follow-up Program for the Project. The purpose of the Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project. To ensure the Program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the EIS. The Follow-Up Program will include: • An evaluation of the adequacy of existing data to provide a benchmark against which to test Project-related effects; • A monitoring design drawing on the measurable parameters identified to be field-tested; • A methodological approach for using field-collected data to measure and verify the accuracy of the effects predicted in the EIS; • A reporting framework that defines frequency of reporting, distribution, and feedback mechanisms; and • Details of the VFPA's approach to adaptive management for the Project through construction and operation.	**EIS** 33.0 Environmental Management Program 33.5 Roberts Bank Terminal 2 Follow-up Program
SFN-12.4	Concerned with marine mammals strikes. Stated that Semiahmoo First Nation has found evidence of strikes to sea lions, grey whales, and humpbacks.	11-Jun-2015, Meeting	**11-Jun-2015, Meeting:** Recorded comment for consideration by the Project team.	**Addressed in EIS Appendix 7.2-B (#89):** The Appendix considers the potential effects on marine mammals of marine vessel traffic associated with Project construction and operation, including the potential for physical disturbance due to a Project-related vessel strike. As described in the EIS, as a result of mitigation measures during construction and operation, no detectable or measurable residual adverse effects from vessel strikes are predicted for marine mammals. The marine mammal assessment considers the potential for cumulative effects with respect to the potential residual effect (i.e., increased underwater noise produced by container ships and support tugs during Project operation), in combination with other projects and activities within the RAA, including underwater noise from incremental marine vessel traffic outside VFPA jurisdiction. **Addressed in MSA Appendix 5-B (#44):**	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 14.0 Marine Mammals 14.6 Future Conditions with the Project 14.6.2 Potential Effects of the Project on Southern Resident Killer Whales 14.6.3 Potential Effects of the Project on North Pacific Humpback Whale 14.6.4 Potential Effects of the Project on Steller Sea Lions Table 14-19 Injury and Disturbance Radii for Steller Sea Lions during Impulsive Construction Noise

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
				The assessment of marine mammals (MSA Section 8.2) includes consideration of potential effects on whales, including vessel strikes by Project-associated vessels. Overall, the assessment notes potential residual effects on marine mammals, which include behavioural disturbance and masking due to changes to the acoustic environment and physical disturbance from vessel strikes, from Project-associated vessel transit activities are expected to be not significant for marine mammals. Incremental marine shipping associated with the Project is not anticipated to have an adverse effect on either southern resident killer whales or North Pacific humpback whale critical habitat features when needed for life functions, or on the survival or recovery of southern resident killer whales, North Pacific humpback whales, or Steller sea lions. Cumulative effects are expected to be not significant for seals, sea lions, baleen whales, and toothed whales other than southern resident killer whales. The assessment concludes that since past activities and projects have had a significant adverse effect on southern resident killer whales, Project-associated vessel activities in combination with existing and future vessel activity are expected to result in a significant cumulative effect to marine mammals. **Addressed in response to IR5-41:** The VFPA's response to IR5-41 discusses the combination of lines of evidence used to support conclusions regarding the frequency and effects of vessel strikes on marine mammals in the marine shipping area. In summary, it was concluded that incremental effects of vessel strikes from RBT2-associated vessel traffic would be moderate in magnitude and occur infrequently above and beyond strikes occurring during existing conditions, and were determined to be not significant. These predictions were based on the multiple lines of evidence as described in the response. Note the response focuses on baleen whales (represented by humpback whales) as it is unlikely that container ships associated with the Project would strike a toothed whale (represented by southern resident killer whale) or a pinniped (represented by Steller sea lion), resulting in injury or mortality (MSA Section 8.2.6.3).	14.10 Cumulative Effects Assessment **MSA** Appendix 5-B Aboriginal Issues and Interests 8.2 Marine Mammals 8.2.6.3 Potential Effect #2 – Physical Disturbance from Vessel Strikes 8.2.7.2 Mitigation – Vessel Strikes 8.2.8.2 Residual Effect #2 – Physical Disturbance from Vessel Strikes 8.2.8.4 Summary of Residual Effects and Significance 8.2.9 Cumulative Effects Assessment **Information Requests** Response to Sufficiency Information Request #41 (IR5-41 of CEAR Document #1159)
SFN-12.5	Expressed an interest in learning more about the VFPA's (Enhancing Cetacean Habitat and Observation) ECHO Program.	01-Feb-2017, Meeting	**01-Feb-2017, Meeting:** Committed to provide more information on ECHO. **10-May-2017, Email from the VFPA:** Attached the ECHO Program annual report for 2016. The ECHO Program is a VFPA-led collaborative initiative aimed at better understanding and managing the cumulative impacts of shipping activities on at-risk whales throughout the southern coast of B.C.	**Addressed in response to IR4-10:** As noted in the VFPA's response to IR4-10, in 2014, the VFPA-led ECHO Program was developed as a collaborative initiative aimed at better understanding and managing the impact of shipping activities on at-risk whales throughout the southern coast of B.C. The VFPA-led ECHO Program engages and involves key regional interested parties to maximise program success and help ensure that mitigation and management measures developed through the program are informed by social, cultural, economic, and environmental sustainability interests. The ECHO Program is guided by the advice and input of an advisory working group, and supported by a federal government advisory committee and associated technical committees. Through engagement and consultation with stakeholders, including Indigenous groups, the ECHO Program has initiated or supported short-term projects, scientific studies, and educational initiatives to fill knowledge gaps necessary to inform the development of credible, science-based threat reduction solutions and management options to reduce cumulative effects of shipping to at-risk whales in the region.	**Information Requests** Response to Sufficiency Information Request #10 (IR4-10 of CEAR Document #1051)

Table 13: Mitigation for Marine Biophysical Valued Components (including Onsite Habitat Concepts)

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-13.1	Stated that the VFPA should be working to improve the current state of fisheries, not working to mitigate effects (i.e., there should not be any effects).	01-Feb-2017, Meeting	**01-Feb-2017, Meeting:** Recorded comment for consideration by the Project team.	**Addressed in EIS Section 17.0:** Habitat offsetting plans are addressed in EIS Section 17.3.2). The VFPA undertakes several environmental programs and initiatives aimed towards protecting the environment. More information on this topic can be found on the VFPA's website: http://www.portmetrovancouver.com/environment/	**EIS** 17.0 Mitigation for Marine Biophysical Valued Components
SFN-13.2	Stated that there should be accommodation for the land transfer.	01-Feb-2017, Meeting	**01-Feb-2017, Meeting:** Responded that they would take back the request and get back to Semiahmoo First Nation.	**Additional information provided by the VFPA:** A recent land transaction with the Provincial government resulted in the Federal government acquiring additional land and water lots in the vicinity of Roberts Bank that the VFPA believes will be needed to accommodate future development to facilitate growing trade through Roberts Bank now and into the future at existing, or if permitted, new terminals. Therefore, there has been an increase in federal ownership within the asserted traditional territory of Semiahmoo First Nation, not a diminution. The VFPA's view is that there is no potential that the conduct in question (land transfers) may adversely affect an Aboriginal claim or right. The VFPA's conclusion in the EIS is that there will be no adverse impacts to Aboriginal or treaty rights from the Project. If it is subsequently determined that RBT2 will adversely impact asserted or established Aboriginal or treaty rights, accommodation will be negotiated with the affected Indigenous groups.	

Table 14: Noise and Vibration – Intermediate Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-14.1	Asked what could be done if noise exceeded predicted levels.	08-Oct-2014, Preliminary EIS Workshop #2	**08-Oct-2014, Workshop:** Responded that the EIS describes predicted changes in noise levels. Noted that the presentation does not include the list of the proposed mitigation measures around noise. Sections in the EIS will include such matters under 'Human Health'. A monitoring study is one of the proposed activities, essentially follow-up monitoring to measure the noise levels in the future, for comparison with the VFPA's predictions. If predictions prove to be inaccurate, the plan is to work with the responsible parties to see what the sources of noise are, and what can be done to reduce them. Given the nature of a quantitative cumulative change analysis, it is difficult to predict exactly what the noise contribution from other projects and traffic will be. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS for the proposed Project, including EIS Appendix 7.2-B, which provides responses to questions raised by Semiahmoo First Nation. **14-Jun-2016, Letter from the VFPA:** Semiahmoo First Nation was notified and provided with the revised version of EIS Section 27.0 and EIS Appendix 27-B.	**Addressed in EIS Appendix 7.2-B (#32):** An adaptive management approach will be taken as indicated in EIS Section 33.5. The VFPA is committed to developing and implementing a Follow-up Program for the Project. The purpose of the Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project. To ensure the Program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the EIS. The Follow-up Program will include: • An evaluation of the adequacy of existing data to provide a benchmark against which to test Project-related effects; • A monitoring design drawing on the measurable parameters identified to be field-tested; • A methodological approach for using field-collected data to measure and verify the accuracy of the effects predicted in the EIS; • A reporting framework that defines frequency of reporting, distribution and feedback mechanisms; and • Details of the VFPA's approach to adaptive management for the Project through construction and operation. **Addressed in EIS Appendix 7.2-B (#43):** Suggested mitigation measures were considered in the development of proposed mitigation for Project-related changes in noise. Noise Management Plans will be developed for construction and operation phases and will integrate with the VFPA's existing noise monitoring programs. Mitigation of construction-related noise could include: • Scheduling of higher-noise generating activities during weekdays, and during the daytime; • Shutdown of equipment and vehicles when not in use; • Utilisation of equipment that produces less noise; and • Awareness and training for construction crews. Mitigation for operation-related noise could include: • Optimised tonality of equipment alarms to limit audibility on shore while meeting safety requirements; • Operator awareness and training; and • Regular maintenance of equipment (e.g., lubrication of pulleys and other moving parts, replacement of deteriorated exhaust mufflers, maintaining efficiencies of engines through servicing). **Addressed in response to AIR-12.04.15-13:** In responding to AIR-12.04.15-13, it was determined that the correct and measurable noise effect (sleep impairment) in EIS Section 27.0 had not been carried forward for a significance determination of the residual effect, and for a cumulative effects assessment. Revisions were made to EIS Section 27.0 and EIS Appendix 27-B to provide supporting analysis. The section also includes revisions related to the comparison of noise levels to international thresholds for speech comprehension and sleep impairment. The overall conclusions of the assessment did not change.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 9.3 Noise and Vibration 9.3.6 Methods 9.3.7 Existing Conditions 9.3.9 Future Conditions with the Project 9.3.10 Future Conditions with the Project and Other Certain and Reasonably Foreseeable Projects and Activities 27.0 Human Health (revised June 2016) Appendix 27-B Noise and Vibration Human Health Risk Assessment Technical Report (revised June 2016) 33.0 Environmental Management Program 33.5 Roberts Bank Terminal 2 Follow-up Program **Information Requests** Response to Additional Information Request #13 (AIR-12.04.15-13 of CEAR Document #388)
SFN-14.2	Expressed concern with increased noise related to rail traffic and cumulative effects, and requests a percentage breakdown of where rail traffic	04-Dec-2014, Meeting	**04-Dec-2014, Meeting:** Responded that that information may have been included in the Project overview presentation from workshop #1 (07-Oct-2014).	**Addressed in EIS Section 9.3:** EIS Section 9.3 presents the assessment of atmospheric noise and vibration potential effects of the project. In the upland study area, Project-related increases in average annual noise levels are, for the most part, expected to be minor and not perceptible, with the following exceptions: • During certain months, construction activities are anticipated to result in perceptible increases in noise.	**Information Requests** Response to Sufficiency Information Request #3 (IR1-03 of CEAR Document #897) Appendix IR1-03-A Container Traffic Forecast Study – Port of

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	generated by RBT2 is travelling to.		Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS for the proposed Project, including EIS Appendix 7.2-B, which provides responses to questions raised by Semiahmoo First Nation.	• The number of intermittent noises related to cargo handling and train shunting during operation would increase, but the noise levels perceived from shore would be the same or lower than noise levels from the existing Roberts Bank terminals, since the new marine terminal would be located further from shore. In the marine study area, noise levels during construction and operation would vary depending on the distance from the terminal, ranging from increases of 13 A-weighted decibels (dBA) within 1 kilometre away from the terminal, to no increase 10 kilometres away from the terminal, with the largest increases predicted to occur at locations within 1 kilometre of the marine terminal. The construction and operation of the Project is not expected to result in perceptible increases in levels of ground-borne vibration. It is expected that there would be minimal incremental cumulative changes in noise levels as a result of the combination of Project-related noise and with additional road and rail activity on the expanded causeway and on the upland road and rail corridors within the study area. **Addressed in response to IR1-03:** In the VFPA's response to IR1-03, the VFPA presents the *Container Traffic Forecast Study – Port of Vancouver, 2016* by Ocean Shipping Consultants (Appendix IR1-03-A). Past and projected future rail-based container movement data from the Port of Vancouver is presented by destination, including western Canada, 'other' Canada, and the U.S.A. Appendix IR1-03-A forecasts that containers carrying cargo to or from the U.S.A. will remain steady at 23% of imports.	Vancouver, 2016 by Ocean Shipping Consultants

Table 15: Ongoing Productivity of Commercial, Recreational, and Aboriginal Fisheries – Valued Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-15.1	Concern raised that sockeye salmon and eulachon are not considered in the assessment. Stated that sockeye and eulachon harvesting are already constrained by scarcity and DFO restrictions. Stated that Semiahmoo First Nation is unable to meet their cultural needs.	03-Aug-2016, Issues Workshop – Métis Nation British Columbia, Semiahmoo First Nation, Tsleil-Waututh Nation	**03-Aug-2016, Workshop:** Responded that from a biological productivity perspective, Chinook and chum represent a more conservative assessment. From a purely hypothetical ecological point of view, if sockeye had been selected, the biologists would have concerns that potential effects were underrepresented because effects to rearing and migration patterns would not have been considered. Stated that sockeye were looked for in relation to the DP3 when a lot of field work was done in the Roberts Bank area, and no sockeye were caught. Similarly, when field studies for RBT2 were undertaken no sockeye or eulachon were caught. Responded that it is not that they were purposefully excluded; there is evidence backing up the approach that they are not the best representative species. These studies were done in seasons and timings when eulachon and sockeye should have been present, so the findings suggest their use of the area is limited. Expressed an interest to hear any suggestions that Semiahmoo may have for how the VFPA could move forward on this issue.	**Addressed in EIS Appendix 7.2-B (#103):** Sockeye salmon was not selected as a representative species within the Pacific salmon sub-component, as studies indicate that juvenile sockeye salmon do not use the Roberts Bank area in high abundance, relative to chum and Chinook salmon (which have been selected as representative species in the assessment). Since chum and Chinook are the most estuarine-dependent species of salmon, the potential for Project-related interactions with these species is greatest. Results of the assessment based on these two species represent a more conservative approach, given the life histories and habitat use of chum and Chinook. Therefore, potential Project-related effects on sockeye salmon are considered within the assessment through the assessment on the sub-component Pacific salmon, as represented by chum and Chinook. Sockeye salmon are considered in the assessment of marine commercial use as the primary species of salmon sought in the assessment area. The economic component of sockeye fishing is addressed in this section (EIS Section 21.0). **Addressed in EIS Appendix 7.2-B (#106):** While recognising that other fisheries have historically occurred or currently occur at or near Roberts Bank, the assessment of Project-related effects on the ongoing productivity of commercial, recreational, and Aboriginal fisheries focuses on fisheries that are most likely to interact with the Project or for which there is sufficient site-specific data on presence and habitat use at Roberts Bank to permit assessment. For these reasons, fisheries such as those for eulachon, sturgeon, shrimp, and octopus are not directly included in the commercial, recreational, and Aboriginal fisheries assessment. **Addressed in response to IR5-15:** In response to IR5-15, the VFPA specifically discusses existing conditions related to eulachon and describes the status and management practices associated with the species. Rationale as to how eulachon were assessed via use of Pacific herring and surf smelt as representative species, as well as similarities between species as they pertain to existing conditions (e.g., life history and habitat requirements), the mechanisms through which the Project may affect eulachon, as well as effectiveness of mitigation, are presented in AIR-12.04.15-09, including Appendix AIR9-A Table 2; and in IR5-15 response. Potential effects on eulachon resulting from changes in the acoustic environment are assessed as minor, based on the low potential of eulachon to interact with the Project during terminal construction (adult eulachon presence in the LAA has not been confirmed, and eulachon larvae rear in the Strait of Georgia outside LAA boundaries). With implementation of mitigation measures (specifically IR5-26 Noise Management Plan), no residual effect on eulachon productivity is anticipated. In the same response, the VFPA specifically discusses existing conditions related to sockeye salmon and describes the status and management practices associated with the species. Rationale as to how sockeye salmon were assessed via use of Chinook and chum as representative species, as well as similarities between species as they pertain to existing conditions (e.g., life history and habitat requirements), the mechanisms through which the Project may affect sockeye, as well as effectiveness of mitigation, are presented in AIR-12.04.15-09, including Appendix AIR9-A Table 2; and in IR5-15 (CEAR Document #1078).	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 13.0 Marine Fish 13.2.1 Sub-components 16.0 Ongoing Productivity of Commercial, Recreational, and Aboriginal Fisheries 16.2.1 Sub-components 21.0 Marine Commercial Use 21.5 Existing Conditions 21.5.2 Aboriginal Commercial Fishing and Seafood Harvesting 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current Use of Lands and Resources for Traditional Purposes **Information Requests** Response to Sufficiency Information Request #15 (IR5-15 of CEAR Document #975)
SFN-15.2	Requested that the distinction between FSC permits and commercial fishing licenses be clearer.	04-Dec-2014, Health & Aboriginal Rights Workshop - Semiahmoo First Nation	**04-Dec-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS for the proposed Project, including EIS Appendix 7.2-B, which provides responses to questions raised by Semiahmoo First Nation.	**Addressed in EIS Appendix 7.2-B (#118):** The marine commercial use effects assessment includes commercial marine fish and seafood harvesting, including activities under communal commercial licences held by Indigenous groups. Fish and seafood harvesting for food, social, ceremonial, and domestic purposes (as per the Aboriginal Fishing Strategy) by Indigenous groups is considered in EIS Section 32.0.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 21.0 Marine Commercial Use 21.5.2 Aboriginal Commercial Fishing and Seafood Harvesting 32.0 Potential or Established Aboriginal and Treaty Rights

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
					and Related Interests, including Current Use of Lands and Resources for Traditional Purposes 32.2.6 Future Conditions with the Project - Potential Project-related Effects
SFN-15.3	Stated that there can be no more development and effects to the Fraser River and Salish Sea until fish stocks are back up to past standards.	01-Feb-2017, Meeting	**01-Feb-2017, Meeting:** Asked if it would be helpful to return with a marine expert. Stated that the VFPA has heard a lot of concerns related to fish going to the Fraser River, and monitoring and mitigation suggestions. **09-Jul-2017, Letter from the VFPA:** Asked about arranging meetings on specific topics of interest in Semiahmoo. **17-Jul-2017, Phone Call:** Spoke to Semiahmoo First Nation about their ongoing interests and concerns and agreed to arrange a meeting to discuss further. **20-Sep-2017, Meeting:** The VFPA, with the biophysical technical environmental assessment lead, met with Semiahmoo to discuss the Follow-up Program as well as their concerns regarding the Project.	**Additional information from the VFPA:** As part of the VFPA's approach to environmental stewardship and sustainability, we have been proactively enhancing local habitat for more than 20 years. Since 1991, the VFPA has been creating, restoring, and enhancing fish and wildlife habitat—including salt water marshes, intertidal marshes, and eelgrass beds—to help maintain a balance between a healthy environment and future development that may be required for port operations. The Habitat Enhancement Program (HEP), which was formalised through a 2012 Working Agreement with DFO, improves the VFPA's ability to offset potential impacts of development. The program consists of projects around the Lower Mainland, through which the VFPA ensures the viability and sustainability of new and enhanced habitat. Further information concerning HEP is available at: https://www.portvancouver.com/environment/water-land-wildlife/habitat-enhancement/	**https://www.portvancouver.com/environment/** **https://www.portvancouver.com/environment/water-land-wildlife/habitat-enhancement/**

Table 16: Port Operations

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-16.1	Concerned with the VFPA's ability to regulate its tenants and/or operators. Concerned that this will affect the VFPA's ability to implement and/or enforce Project mitigation.	04-Dec-2014, Health & Aboriginal Rights Workshop - Semiahmoo First Nation	**04-Dec-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS for the proposed Project, including EIS Appendix 7.2-B, which provides responses to questions raised by Semiahmoo First Nation.	**Addressed in EIS Appendix 7.2-B (#192):** Describes the proposed environmental management framework, including compliance monitoring and reporting requirements to federal and provincial environmental regulators for both the construction and operation phases. The VFPA is committed to implementing all mitigation recommended by the Minister of Environment if the Project is approved. The VFPA takes a precautionary approach and upholds a high level of environmental protection within VFPA jurisdiction that meets or exceeds legislative requirements. **Addressed in EIS Section 4.0:** Describes the construction components of the marine terminal that will be the Infrastructure Developer's responsibility, while the Terminal Operator will be responsible for constructing and installing terminal infrastructure from the pavement up. Breaches of contractual terms are governed by the agreements' terms as well as by the common law. **Addressed in response to IR1-01:** The VFPA's response to IR1-01 discusses more broadly how the VFPA asserts its authority in the context of RBT2's construction and operation via berth corridor agreements and land leases.	**EIS** 33.0 Environmental Management Program **Information Requests** Response to Sufficiency Information Request #01 (IR1-01 of CEAR Document #897) http://www.portvancouver.com/development-and-permits/project-and-environmental-reviews/

Table 17: Potential Accidents or Malfunctions

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-17.1	Concerned with the effects of an oil spill to flyover and resident birds, eelgrass and crab habitat.	11-Jun-2015, Meeting	**11-Jun-2015, Meeting:** Recorded comment for consideration by the Project team. **09-Nov-2015:** Provided a copy of the MSA, which included MSA Appendix 5-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in EIS Appendix 7.2-B (#204):** Potential spills of deleterious materials (e.g., hydrocarbons) and their environmental effects are discussed in the EIS. Plausible worst-case scenarios involving a marine vessel, motor vehicle, and train accident, each assumed to result in a spill of deleterious materials, are assessed. The regulatory management framework, standard practices, and Project-specific measures to reduce the risk of accidents or malfunctions, including spills, as well as the emergency response and mitigation measures to be implemented in the event of a spill are described. Three worst-case scenarios involving hydrocarbon spills were assessed: a container ship impact incident at the terminal, a tanker truck accident on Roberts Bank Way North, and a yard locomotive derailment on the widened causeway. The assessment determined that a ship impact scenario involving a marine spill of heavy fuel oil at the terminal would result in adverse residual effects to all marine biophysical VCs, as well as marine commercial use, outdoor recreation, and land and water use. While the residual effects on southern resident killer whales, coastal birds, and Current Use were considered significant, due to the extremely low probability of such a scenario, all residual effects were considered unlikely. **Addressed in MSA Section 10.5.8:** MSA Section 10.5.8 assesses the potential effects on marine birds caused by the identified plausible worst-case accidents or malfunctions arising from marine shipping associated with the Project. The residual effect of a heavy oil spill on marine birds is determined to be not significant. It is considered unlikely that a spill in Boundary Passage (or elsewhere in the LAA) of 7,500 m^3 will compromise population integrity for marine bird sub-components and species within the LAA. **Addressed in MSA Appendix 5-B (#101):** The potential effects of an oil spill on resident and migrant marine birds, eelgrass, and crab habitat are considered within the assessment of potential accidents or malfunctions (MSA Section 10.0). MSA Section 10.5.6 assesses the potential effects on marine fish and fish habitat caused by the identified plausible worst-case accidents or malfunctions arising from marine shipping associated with the Project. A significant adverse residual effect to marine fish and fish habitat is defined as one that causes a decline in abundance or change in distribution to a level at which a species or habitat cannot maintain itself, and long-term population or habitat integrity is compromised. For a significant residual adverse effect, the following applies: • Re-establishment through natural recruitment (e.g., reproduction or immigration from unaffected areas) is not expected to occur; and • Recovery of population, Conservation Unit (Pacific salmon), or habitat integrity is expected to take longer than two generations. For the reasons outlined above, the effect of a heavy fuel oil spill on marine fish and fish habitat is determined to be not significant.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 30.0 Potential Accidents or Malfunctions Appendix 30-A Marine Vessel Incidence Prediction Inputs to the Quantitative Risk Assessment **MSA** Appendix 5-B Aboriginal Issues and Interests 10.0 Potential Accidents or Malfunctions 10.5.6 Marine Fish and Fish Habitat 10.5.8 Marine Birds
SFN-17.2	Interested in major disaster and spill response planning. Asked how long it takes to respond to an incident and what the process is for responding to spills along the US-Canada.	11-Jun-2015, Meeting 18-Sep-2015, Meeting	**11-Jun-2015, Meeting:** Recorded comment for consideration by the Project team. **13-Aug-2015, Email:**	**Addressed in EIS Appendix 7.2-B (#207):** The EIS describes the parties who would be notified and assume responsibility as On Scene Commander for spill clean-up in the event of a marine spill within VFPA jurisdiction, including Roberts Bank. These parties include the Canadian Coast Guard and the WCMRC. The VFPA's role following a spill would be to maintain situational awareness and coordinate the incident response.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 30.0 Potential Accidents or Malfunctions 30.3.3 VFPA Practices and Procedures

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			Pages 4 and 5 of the Transport Canada Marine Response Organizations Standards document (http://www.tc.gc.ca/media/documents/marinessafety/tp12401e.pdf) provide information on the minimum requirements for response times, which vary by spill quantity and area. Western Canada Marine Response Corporation (WCMRC), as the responsible party for spill response, could better speak to typical response times. **14-Oct-2015, Email:** The MSA includes a section on potential accidents and malfunctions, including information on spill response outside of VFPA jurisdiction. EIS Section 30.0, as well as EIS Appendix 30-A, provide information regarding disaster and spill response within VFPA jurisdiction.	**Addressed in MSA Appendix 5-B (#102):** Details on spill response, including responsibilities of various parties, response timelines, and equipment requirements, are provided in the mitigation section of the assessment of potential accidents or malfunctions (MSA Section 10.0). WCMRC is the Transport Canada-certified Response Organisation for the west coast of Canada. Upon request of a Responsible Party of upon direction of the designated authority (i.e., Canadian Coast Guard or Transport Canada), WCMRC would executive the spill containment and clean-up. As a Response Organisation pursuant to the *Canada Shipping Act, 2001*, WCMRC is required to demonstrate to Transport Canada that logistical arrangements are in place to meet Response Time Planning Standards within its Geographic Area of Response. Detailed Oil Spill Response Plans are prepared and executed by the WCMRC, and submitted to Transport Canada. Additional information is available here: http://wcmrc.com/. **Additional information provided by the VFPA:** Transport Canada's letter to the Review Panel dated April 7, 2017 (CEAR Document #954), as well as letter to the Review Panel dated December 20, 2017 (CEAR Document #1133) provides additional information on the Government of Canada's Oceans Protection Plan, which includes information on spill response and environmental protection.	Appendix 30-A Marine Vessel Incidence Prediction Inputs to the Quantitative Risk Assessment **MSA** Appendix 5-B Aboriginal Issues and Interests 10.0 Potential Accidents or Malfunctions 10.4 Mitigation Measures Table 10-2 Spill Response Procedure Summary 10.4.4.3 Geographic Area of Response and Standard Response Times **From Transport Canada to the Review Panel re: Overview of the Government of Canada's Oceans Protection Plan (CEAR Documents #954 and #1133)**
SFN-17.3	Referenced the distance of the Semiahmoo area from emergency responders. Stated that in the event of a spill of hazardous material, the Port would not notice a spill in the Semiahmoo area until it was too late to be effective. Semiahmoo Bay is far away from the nearest emergency management services meaning response time would be slow.	11-Jun-2015, Meeting	**11-Jul-2015, Meeting:** Recorded comment for consideration by the Project team.	**Addressed in EIS Appendix 7.2-B (#207):** The EIS describes the parties who would be notified and assume responsibility as On Scene Commander for spill clean-up in the event of a marine spill within VFPA jurisdiction, including Roberts Bank. These parties include the Canadian Coast Guard and the WCMRC. The VFPA's role following a spill would be to maintain situational awareness and coordinate the incident response. **Addressed in MSA Appendix 5-B (#102):** Details on spill response, including responsibilities of various parties, response timelines, and equipment requirements, are provided in the mitigation section of the assessment of potential accidents or malfunctions (MSA Section 10.0). WCMRC is the Transport Canada-certified Response Organisation for the west coast of Canada. Upon request of a Responsible Party of upon direction of the designated authority (i.e., Canadian Coast Guard or Transport Canada), WCMRC would executive the spill containment and clean-up. As a Response Organisation pursuant to the *Canada Shipping Act, 2001*, WCMRC is required to demonstrate to Transport Canada that logistical arrangements are in place to meet Response Time Planning Standards within its Geographic Area of Response. Detailed Oil Spill Response Plans are prepared and executed by the WCMRC, and submitted to Transport Canada. Additional information is available here: http://wcmrc.com/. **Additional information provided by the VFPA:** Transport Canada's letter to the Review Panel dated April 7, 2017 (CEAR Document #954), as well as letter to the Review Panel dated December 20, 2017 (CEAR Document #1133) provides additional information on the Government of Canada's Oceans Protection Plan which includes information on emergency response and environmental protection.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 30.0 Potential Accidents or Malfunctions 30.3.3 VFPA Practices and Procedures **MSA** Appendix 5-B Aboriginal Issues and Interests 10.0 Potential Accidents or Malfunctions 10.4 Mitigation Measures Table 10-2 Spill Response Procedure Summary 10.4.4.3 Geographic Area of Response and Standard Response Times **From Transport Canada to the Review Panel re: Overview of the Government of Canada's Oceans Protection Plan (CEAR Documents #954 and #1133)**

Table 18: Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current Use of Lands and Resources for Traditional Purposes

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-18.1	Stated that that Tsawout First Nation and Lummi Nation members have sites at Roberts Bank where they used to fish. Asked if the VFPA was engaging with Lummi Nation. Noted they should be included as a transboundary nation for consultation; Semiahmoo First Nation explained they have members south of the bother who are part of Lummi.	11-Jun-2015, Meeting 01-Feb-2017, Meeting 20-Sep-2017, Meeting	**11-Jun-2015, Meeting:** Responded that marine shipping in this area (south of the border) may affect Semiahmoo First Nation, but the VFPA has no power to regulate this area. **01-Feb-2017, Meeting:** Responded that the VFPA is not engaging with Lummi, and is following directions from the *EIS Guidelines*. **20-Sep-2017, Meeting:** Stated that the VFPA has not engaged with any Indigenous groups across the border. Stated that the VFPA is following the CEA Agency guidelines, which has no direction to engage with U.S. groups.	**Additional information provided by the VFPA:** The CEA Agency is responsible for Crown consultation under the CEA Agency process, including identification of Indigenous groups for inclusion in the *EIS Guidelines*. The VFPA has engaged and consulted with Indigenous groups as listed in the *Updated EIS Guidelines*. Where available, information related to Indigenous groups in the U.S.A. has been considered (see MSA Section 8.1.5.4).	**MSA** 8.1 Marine Fish and Fish Habitat 8.1.5 Existing Conditions 8.1.5.4 Marine Invertebrates 9.5 Current Use of Lands and Resources for Traditional Purposes and Aboriginal and Treaty Rights ***Updated Guidelines for the Preparation of an Environmental Impact Statement* (*CEAR Document #177*)**
SFN-18.2	Stated that if Semiahmoo First Nation were able to practice reefnet fishing at Point Roberts as they did in the past, they would be impacted by the Project. Stated that Semiahmoo First Nation has village sites around Point Roberts and protecting Point Roberts is important. Stated that the process of determining effects to current use is unfair as Semiahmoo First Nation's current use is currently restricted by environmental concerns, regulatory restrictions, etc. Concerned that the current use assessment excludes past use from consideration.	04-Dec-2014, Health & Aboriginal Rights Workshop – Semiahmoo First Nation 21-May-2015, Meeting 11-Jun-2015, Meeting	**04-Dec-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2014, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. **21-May-2015, Meeting:** Recorded comment for consideration by the Project team. **11-Jun-2015, Meeting:** Recorded comment for consideration by the Project team. **09-Nov-2015, Letter from the VFPA:** Provided a copy of the MSA, which included MSA Appendix 5-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in MSA Appendix 5-B (#81):** Concern is noted. The VFPA acknowledges that reported Current Use in a given area does not necessarily reflect past levels of use or desired future use by Indigenous groups, and this is reflected in the assessment wherever relevant as indicated by an Indigenous group. The assessment of potential adverse effects on Aboriginal and treaty rights is primarily based on the results of the Current Use analysis and effects assessment, as well as the results of the Indigenous group consultation undertaken for the Project. The assessment of Current Use does not limit the assessment of Aboriginal and treaty rights. The assessment of rights includes all Aboriginal and treaty rights, regardless of whether they are being currently exercised. **Addressed in EIS Appendix 7.2-B (#174):** The methods used to assess the potential effects of the Project are described in EIS Section 8.0. These methods are consistent with existing federal guidance, including the *EIS Guidelines* issued by the CEA Agency. The rationale for the determination of negligible residual effects to Current Use is included in the EIS. Information sources used in EIS Section 32.0 are listed in Section 32.2.3, with Project-specific studies appearing in Section 32.2.3.1. A full list of references cited appears in Section 32.4. Information related to factors limiting Semiahmoo First Nation current use, and desired future use, is incorporated into EIS Section 32.2.1.3. **Addressed in EIS Appendix 7.2-B (#151):** A description of the past use of the Roberts Bank area by Indigenous groups is provided in EIS Section 32.0. The presentation of information on past use of the area in the assessment of archaeological and heritage resources is tailored to those Indigenous groups whose past uses is directly linked to the type of physical archaeological resources that have the potential to be present in the study area, and have the potential to be affected by the Project.	**MSA** Appendix 5-B Aboriginal Issues and Interests 9.5 Current Use of Lands and Resources for Traditional Purposes and Aboriginal and Treaty Rights 9.5.4 Existing Conditions 9.5.11 Potential Adverse Impacts on Asserted or Established Aboriginal and Treaty Rights **EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 8.0 Effects Assessment Methods 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current Use of Lands and Resources for Traditional Purposes 32.2.1.3 Semiahmoo First Nation 32.2.4 Existing Conditions
SFN-18.3	Concerned that they were not consulted on most of the studies identified as information sources for Section 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current	04-Dec-2014, Health & Aboriginal Rights Workshop -	**04-Dec-2014, Workshop:** Recorded comment for consideration by the Project team. **12-Sep-2014, Email from the VFPA:** Provided Semiahmoo First Nation with draft EIS Section 32.0 for review and comment.		

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Use of Lands for Traditional Purposes. Committed to review the information sources and provide confirmation/information to the VFPA.	Semiahmoo First Nation	**06-Jan-2015, Email from the VFPA:** Followed-up on the provision of EIS Section 32.0, requesting any comments before January 15.		
SFN-18.4	Stated that Semiahmoo First Nation does not agree with the conclusion that the Project is not expected to adversely impact Semiahmoo First Nation Current Use or Rights and Related Interests and requested a cumulative effects assessment that includes previous developments.	04-Dec-2014, Health & Aboriginal Rights Workshop - Semiahmoo First Nation	**04-Dec-2014, Workshop:** Responded that the information being presented is preliminary. Stated that the VFPA wants to share it with Semiahmoo First Nation prior to studies being done and mitigation planning so the VFPA can get Semiahmoo First Nation's feedback before finalising the EIS. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS for the proposed Project, including EIS Appendix 7.2-B, which provides responses to questions raised by Semiahmoo First Nation.	**Addressed in EIS Appendix 7.2-B (#157):** The methods used to assess the potential effects of the Project, including both residual effects of the Project and cumulative effects, are described in EIS Section 8.0. These methods are consistent with existing federal guidance. The effects of other projects and activities that have been carried out are reflected in the existing (and expected) conditions of the ICs and VCs, and in EIS Section 32.0. By assessing potential Project-related effects against those conditions, the cumulative effects of the Project and other past projects and activities are inherently considered. The EIS also includes historical data, where available and applicable, to assist interested parties to understand the potential effects, including cumulative effects, of the Project. The EIS does not include an assessment of historical infringements on the ability of Indigenous groups to exercise rights or impacts to traditional use. **Addressed in response to AIR-12.04.15-30:** In response to AIR-12.04.15-30, on 19-Feb-2016 the VFPA provided additional rationale, beyond that presented in the EIS, for the conclusions of the effects assessment for Current Use. The VFPA recognises that there is a high level of subjectivity associated with establishing the degree to which Project-related changes may be experienced as measurable or non-measurable by a given Indigenous group. For these reasons, the VFPA proposed mitigation measures to address potential Project-related effects on Current Use not only for potential effects identified as measurable, but also for potential effects identified as non-measurable, and specifically by proposing mechanisms for ongoing consultation (see EIS Section 32.2.7). The response may be accessed on the CEA Agency Registry for the Project: https://www.ceaa-acee.gc.ca/050/document-eng.cfm?document=107580 As part of the review process for the Project, concerns and feedback may also be submitted directly to the review panel for consideration.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 8.0 Effects Assessment Methods 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current Use of Lands and Resources for Traditional Purposes 32.2.6 Future Conditions with the Project - Potential Project-related Effects 32.2.7 Mitigation Measures **Information Requests** Response to Additional Information Request #30 (AIR-12.04.15-30 of CEAR Document #388) Table AIR30-1 Rationale for Predicted Level of Effect
SFN-18.5	Asserted Aboriginal title to the Project area. Stated that Aboriginal title needs to be considered in the assessment and a strength of claim assessment be undertaken.	25-Aug-2014, Meeting 04-Dec-2014, Health & Aboriginal Rights Workshop - Semiahmoo First Nation	**25-Aug-2014, Meeting:** Recorded comment for consideration by the Project team. **04-Dec-2014, Meeting:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in EIS Appendix 7.2-B (#193):** Potential Project-related effects on asserted Aboriginal title are not directly assessed in the EIS; however, the asserted traditional territory of each Indigenous group (other than Tsawwassen First Nation) is identified in the EIS. Potential Project-related effects to areas that are or have been used for fishing, hunting, or otherwise using resources, including access to those areas, are considered in EIS Section 32.0.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current Use of Lands and Resources for Traditional Purposes
SFN-18.6	Advised that the VFPA has referenced an out-of-date map	04-Dec-2014, Health & Aboriginal	**04-Dec-2014, Workshop:** Recorded comment for consideration by the Project team.	**Addressed in EIS Section 32.0:** The EIS includes the map showing asserted traditional territory, which was updated to show the entire extent of that territory (i.e., including area in the U.S.A.): EIS	**EIS** 32.0 Potential or Established Aboriginal and Treaty Rights and

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	showing Semiahmoo First Nation's Traditional Territory. Requested the new one be used that shows the extension of the Territory over the international border.	Rights Workshop - Semiahmoo First Nation	**06-Jan-2015:** Semiahmoo First Nation provided the VFPA with the above-mentioned map. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Figure 32-3 Semiahmoo First Nation Asserted Traditional Territory and Local Assessment Areas of Linked Biophysical VCs.	Figure 32-3.	Related Interests, including Current Use of Lands and Resources for Traditional Purposes Figure 32-3 Semiahmoo First Nation Asserted Traditional Territory and Local Assessment Areas of Linked Biophysical VCs
SFN-18.7	Stated that Active Pass is a travel route for Semiahmoo First Nation to the Gulf Islands and Victoria. Stated that access to islands (and burial grounds) is important to Semiahmoo First Nation.	11-Jun-2015, Meeting	**11-June-2015, Meeting:** Recorded comment for consideration by the Project team. **09-Nov-2015, Letter from the VFPA:** Provided a copy of the MSA, which included MSA Appendix 5-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in MSA Appendix 5-B (#68):** The assessment of Current Use (MSA Section 9.5) considers cultural practices, such as use of travel routes and the use of waterways. MSA Section 9.5 includes an assessment of several aspects related to cultural practices, including potential changes to the following: • Access to preferred Current Use locations; and • Quality of Current Use experience.	**MSA** Appendix 5-B Aboriginal Issues and Interests 9.5 Current Use of Lands and Resources for Traditional Purposes and Aboriginal and Treaty Rights 9.5.4 Existing Conditions 9.5.5 Potential Interactions and Effects 9.5.5.1 Negligible Effects of Vessel Transit on Current Use 9.5.5.2 Potential Effects of Vessel Transit on Current Use

Table 19: Project Benefits

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-19.1	Indicated that Semiahmoo First Nation want to discuss an Impact Benefits Agreement. Requested an Impact Benefits Agreement guaranteeing opportunities such as employment for First Nations. Stated that the Tsilhqot'in decision should be reflected in the assessment to Aboriginal rights, and Semiahmoo First Nation should have an opportunity to meaningfully benefit from their lands. Stated that the Impact Benefits Agreement should cover RBT2 and previous port projects that Semiahmoo First Nation feels they were not properly consulted on. Stated that it is beyond revenue sharing and accommodation dollars - it is the Aboriginal right to benefit from the land. Asked about the VFPA's procurement policy. Expressed interest in direct benefits such as access to training, employment and infrastructure. Expressed interest in revenue sharing, business opportunities and direct awards, capacity building, and regaining their fishing grounds across the border. Requested funding to support the negotiation of a Mutual Benefits Agreement.	19-Jul-2013, Meeting 04-Dec-2014, Health & Aboriginal Rights Workshop – Semiahmoo First Nation 01-Feb-2017, Meeting 21-Jul-2017, Meeting	**19-Jul-2013, Meeting:** Stated that it is too early for these discussions. Noted that the Project has not even entered the environmental assessment process, and that it will be some time before being able to determine whether there are any Project impacts or not and to explore options for mitigation. **04-Dec-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS for the proposed Project, including EIS Appendix 7.2-B, which provides responses to questions raised by Semiahmoo First Nation. **12-May-2016, Letter from the VFPA:** Preliminary employment opportunities information was provided to Semiahmoo First Nation for discussion. The VFPA will continue to provide information about Project-related employment opportunities as it becomes available. **01-Feb-2017, Meeting:** Responded that procurement for the Project is still in development and the VFPA can consider Semiahmoo First Nation's input. Noted that one of upcoming meetings with Semiahmoo First Nation can be focused on Project benefits, as it will require time to fully discuss this aspect. **16-Jun-2017, Letter from the VFPA:** The VFPA is interested in initiating discussions with Semiahmoo First Nation regarding potential legacy benefits from the Project. Legacy benefits are intended to benefit Indigenous groups if the Project proceeds, and would be over and above the economic benefits resulting from the Project. Examples of types of legacy benefits are: restoring fisheries, training, funding cultural initiatives, enhancing environmentally sensitive areas, or revitalising aquaculture. It is our intent to develop this concept into a plan that reflect the interests, objectives, and priorities of Indigenous groups involved in the RBT2 Project. We welcome input regarding potential legacy benefits for Indigenous groups that could be provided as part of the Project. With that in mind, we request a meeting with Semiahmoo First Nation to hear about your community's priorities in relation to this funding. In addition to general legacy benefits, the VFPA is interested in entering into direct discussions with	**Addressed in EIS Appendix 7.2-B (#215):** The VFPA proposes to assist Semiahmoo First Nation, Tsleil-Waututh Nation, Stz'uminus First Nation, Cowichan Tribes, Halalt First Nation, Lake Cowichan First Nation, Lyackson First Nation, Penelakut Tribe, Hwlitsum, and Métis Nation British Columbia in accessing potential economic opportunities resulting from the Project, including contracting opportunities as well as construction employment opportunities. To support these Indigenous groups in preparing for employment opportunities, the VFPA will provide training funding and undertake specific job-related information sharing activities, such as job fairs. To support the development and implementation of plans to facilitate access to such Project-related benefits, the VFPA will continue engagement, initiated in December 2014. Opportunities for Indigenous training and employment opportunities related to the Project are described in EIS Section 32.3.3.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current Use of Lands and Resources for Traditional Purposes 32.3.3 Mitigation Measures 34.0 Benefits to Canadians 34.2 Benefits of the Project 35.0 Effects Assessment Summaries Table 35-2 Proposed Mitigation Measures and Commitments

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
			Semiahmoo First Nation regarding a potential mutual benefits agreement (MBA) for the Project. **21-Jul-2017:** Committed to arranging a meeting to discuss a MBA. **13-Sep-2017:** The VFPA and Semiahmoo First Nation met to discuss a MBA. Discussions are ongoing. **27-Sep-2017, Letter from the VFPA:** Provided Semiahmoo First Nation with funding to support the involvement of Semiahmoo First Nation in activities related to negotiation of a MBA. The agreement was signed on 29-Sep-2017.		
SFN-19.2	Asked what the projected revenues are.	21-Jul-2017, Meeting	**21-Jul-2017, Meeting:** Recorded comment for consideration by the Project team.	**Additional information provided by the VFPA:** The VFPA earns its revenues through port fees charged to port users and rents charged to tenants who occupy the federal lands that it manages within its jurisdiction. Although the actual rents we charge are confidential, we look to the local real estate market to guide the amount of rent we charge for the use of our lands. Rent for industrial and commercial tenures is generally reviewed every three years. Canadian Port Authorities pay an annual stipend to the federal government based on its gross revenue. A payment in lieu of property taxes for vacant lands and waters is also made to bordering municipalities within its jurisdiction. Canadian Port Authorities do not have authority to collect taxes. As part of project development, the VFPA is undertaking two separate procurements for the Terminal Operator and for the Infrastructure Developer. The Terminal Operator will provide the port authority with regular payment of rent, as well as ongoing fees and charges, the form and amount of which will be one of the key selection criteria in the procurement process, which is currently underway. The Infrastructure Developer will likely be responsible for the designing, building, financing, and maintaining the terminal land and related infrastructure. Once the Project is constructed, and subject to ongoing availability and function of the terminal, the port authority will make regular payments to the Infrastructure Developer over the upcoming decades, to compensate them for designing, building, financing, and maintaining the terminal. The terms of these long-term agreements with the Terminal Operator and the Infrastructure Developer are commercially confidential and therefore are not available to the public. Any profit the VFPA earns on this Project will be primarily reinvested in infrastructure and other improvements in the gateway for the benefit of all Canadians.	
SFN-19.3	Asked who the terminal operator will be, and whether they could obtain a list of everyone who uses the port within their traditional territory. Requested a list of all procurement or subcontracting opportunities for the RBT2	04-Dec-2014, Health & Aboriginal Rights Workshop – Semiahmoo First Nation	**04-Dec-2014, Workshop:** At this time it is unknown who the Terminal Operator will be.		

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
	Project; and a list of qualified operators for the RBT2 Project. Asked who will operate the Project. Asked if Semiahmoo Development Corporation could.	21-Jul-2017, Meeting 25-Jul-2017, Email	**21-Jul-2017, Meeting:** Responded that it is unknown at this point who will operate it. Stated that there is the opportunity to invest in the Project. If that is of interest we can bring someone down to provide information to you. I will leave it up to you. What we do is not intended to make a profit. **30-Aug-2017, Email from the VFPA:** Subject to receiving the required environmental permits and approvals, as well as a final investment decision, the VFPA intends to procure the construction of the Project under a construction contract. The successful proponent will likely be a consortium made up of large contractors, supported by numerous specialty sub-contractors, as well as engineering, finance, and maintenance firms. The exact make-up of these consortiums will be left to the market to decide; however, the VFPA intends to work to identify and develop suitable economic opportunities for Indigenous groups during the RBT2 construction period as well as ongoing RBT2 operations. It is expected an open Request for Qualifications will be issued to the market in mid-2018, to form a short-list of proponents who will then receive the Request for Proposals package in late 2018 or early 2019. In November 2015, the VFPA shortlisted five qualified teams to participate in the competitive process to select a Terminal Operator for the proposed RBT2 Project. For a list of the teams that were shortlisted, please see the link to our website: http://www.robertsbankterminal2.com/news-updates/terminal-operator-procurement/. In late 2016, the VFPA selected a preferred proponent. Commercially confidential negotiations with the preferred proponent are ongoing.		

Table 20: Project Overview and Description

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-20.1	Concerned that RBT2 could be used for shipping oil and/or coal if other proposed projects do not proceed.	06-Jun-2014, Valued Components Workshop #1 04-Dec-2014, Health & Aboriginal Rights Workshop - Semiahmoo First Nation	**06-Jun-2014, Workshop:** Explained that the VFPA puts a concept forward (container terminal), and regulators determine what needs to be assessed. The *EIS Guidelines* specify exactly what this process is according to the project description, so if it were to change another environmental assessment would have to occur. **04-Dec-2014, Workshop:** Responded that the assessment is specific to the transport of containers, and we do not know if oil and/or coal would be considered for transport in the future, nor what the requirements of making such a shift would be. The question has been noted. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS for the proposed Project, including EIS Appendix 7.2-B, which provides responses to questions raised by Semiahmoo First Nation.	**Addressed in EIS Appendix 7.2-B (#6):** There are no plans to modify the Project to handle bulk oil or coal. **Addressed in EIS Section 4.0:** As noted in EIS Section 4.0, the Project is a container terminal.	**EIS** 4.0 Project Description Appendix 7.2-B Aboriginal Groups Issues and Interests Table

Table 21: Traffic / Transportation

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document(s) and Section(s) providing Additional Information
SFN-21.1	Concerned with increased traffic through Semiahmoo First Nation territory, and the effect on members.	20-Dec-2013, Meeting 06-Jun-2014, Valued Components Workshop #1 04-Dec-2014, Health & Aboriginal Rights Workshop - Semiahmoo First Nation	**20-Dec-2013, Meeting:** Committed to confirm if there is any container traffic on BNSF. **06-Jun-2014, Workshop:** Recorded comment for consideration by the Project team.	**Additional information provided by the VFPA:** BNSF does not transport containers to and from DP3. The effects of truck and train traffic beyond the Roberts Bank causeway is not within the scope of the Project environmental assessment as defined by the *EIS Guidelines*.	**EIS** 4.0 Project Description 8.0 Effects Assessment Methods Table 8-8 Project and Activity Inclusion List ***Updated EIS Guidelines***
SFN-21.2	Asked for information about a grounding vessel.	04-Dec-2014, Health & Aboriginal Rights Workshop - Semiahmoo First Nation	**04-Dec-2014, Workshop:** Recorded comment for consideration by the Project team. **09-Nov-2015:** Provided a copy of the MSA, which included MSA Appendix 5-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in MSA Appendix 5-B (#104):** The assessment of potential accidents or malfunctions (MSA Section 10.0), considers the effects of a plausible worst-case spill scenario on the environment. The plausible worst-case scenario assessed is a powered-grounding of a container ship resulting in a release of heavy fuel oil. The location of the plausible worst-case spill scenario is in Boundary Passage near the south end of South Pender Island. MSA Section 10.0 includes a description of the applicable mitigation for a plausible worst-case spill scenario.	**MSA** Appendix 5-B Aboriginal Issues and Interests 10.0 Accidents and Malfunctions 10.3.3 Identification of Plausible Worst-case Accident or Malfunction Scenarios 10.4 Mitigation
SFN-21.3	Expressed concern with increased truck traffic from the Terminal and air emissions. Noted that current traffic already causes concern for emergency management from accidents and access to the reserve being cut off due to accidents.	01-Feb-2017, Meeting	**01-Feb-2017, Meeting:** Recorded comment for consideration by the Project team.	**Addressed in excerpts from the EIS Appendix 7.2-B (#42):** The assessment concludes that: Air quality will improve in the future, with or without the Project, as a result of improvements in engine technologies and the use of cleaner fuels. • Cumulative changes, incorporating the Project and other certain and reasonably foreseeable projects and activities, are predicted to be small relative to expected future ambient air quality levels. • Project construction activities are predicted to cause a small increase in concentrations of some contaminants. • Criteria air contaminant (i.e., carbon monoxide, nitrogen oxides, sulphur dioxide, particulate matter, and ground-level ozone) and trace organic contaminant (i.e., formaldehyde and other contaminants related to fuel combustion) levels are predicted to be below air quality criteria on land, with limited exceptions. • The Project is expected to have a negligible effect on future ozone levels and to increase greenhouse gas emissions (i.e., carbon dioxide, methane, and nitrous oxide). • Although Project activities would emit black carbon, black carbon is expected to decrease in the future with the Project due to equipment fleet turnover at existing Roberts Bank terminals to newer engines that meet more stringent emission standards for particulate matter. The benefits of existing initiatives are realised in the existing emissions monitored at local air quality stations in Metro Vancouver. Future benefits, such as improvements in fuel, are described based on their anticipated level of benefit to future air quality emissions.	**EIS** 4.2.2.2 Causeway Road Additions and Improvements Appendix 7.2-B Aboriginal Issues and Interests 9.0 Physical Setting 9.2 Air Quality 9.2.5 Methods 9.2.6 Existing Conditions Table 9.2-4 Air Quality Criteria for Criteria Air Contaminants Table 9.2-5 Air Quality Criteria for Toxic Organic Contaminants 9.2.7 Existing Conditions 9.2.8 Future Conditions with the Project 9.2.9 Future Conditions with the Project and Other Projects and Activities Appendix 9.2-A Air Quality Study Main Report Appendix A – Emissions Inventory Appendix B – Existing Air Quality Appendix C – Air Dispersion Modelling Appendix F – Ships Underway Appendix H – Westshore Coal Dust Assessment

APPENDIX IR10-01-C4

TSLEIL-WAUTUTH NATION: ISSUES, VIEWS, AND CONCERNS RELATED TO THE PROPOSED PROJECT AND MARINE SHIPPING ASSOCIATED WITH THE PROJECT

Table 1: Air Quality – Intermediate Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-1.1	Asked who regulates the turnover and replacement of automobiles and related equipment to comply with air quality standards.	08-Oct-2014, Preliminary EIS Results Workshop #2	**08-Oct-2014, Workshop:** Stated that the turnover of automobiles and equipment is not regulated, but it does happen. For example, in 1988, new standards came in for automobiles on the road, explaining it took about 4 or 5 years before the benefits of those new standards were realised (before enough old cars were replaced by new ones meeting the new standards). The same thing occurred when new standards were implemented in 1996: benefits were not realised until about 2000 or 2001. Stated that there is a natural progressive replacement of trucks, as old ones wear out.	**Addressed in response to IR6-32:** The Vancouver Fraser Port Authority (VFPA) is working with terminal operators and railway companies operating within VFPA jurisdiction to progressively reduce emissions from their operations, as it does not own or operate any cargo handling equipment, drayage trucks, or locomotives. The VFPA sets targets and objectives for emission reduction through its participation in the Northwest Ports Clean Air Strategy (NWPCAS). The objectives are developed collaboratively by the VFPA, the Port of Seattle, and the Port of Tacoma. Specific programs and initiatives are then developed by each port in partnership with terminal operators, shipping lines, and railways, where possible, to encourage the achievement of emission reductions (NWPCAS 2017). For more information about the specific programs and initiatives, please see the VFPA's response to IR6-31. **Additional information provided by the VFPA:** New regulations adopted by Transport Canada in June 2017 formally require that new and rebuilt locomotive engines meet the same standards as those mandated by the U.S. Environmental Protection Agency. Previously, members of the Railway Association of Canada voluntarily worked to meet the U.S. standards under a Memorandum of Understanding first signed in 2011. Because all heavy duty diesel trucks are now built exclusively in the U.S.A., new engines must meet emission standards for these types of vehicles. Similarly, emission standards for heavy duty diesel engines also apply to cargo handling equipment such as would be used to replace older equipment at the Deltaport and Westshore terminals when their equipment reaches the end of its useful life. The International Maritime Organization has defined regulations for ocean going vessel fuel quality as part of the North American Emission Control Area (ECA) that reduce emissions of sulphur dioxide and fine particulate matter, and all ships built after 2016 must meet new emission standards for NO_x emissions. The BC Ferries has voluntarily chosen to replace two older ferry vessels operating out of the Tsawwassen ferry terminal with new dual fuel vessels that can operate either on ultra-low sulphur diesel (ULSD) or liquefied natural gas (LNG), and is upgrading the two largest vessels at this terminal to operate as dual fuel vessels. In addition, three other ferry vessels operating out of the Tsawwassen ferry terminal are expected to be replaced before 2025.	**Information Requests** Response to Sufficiency Information Request #31 (IR6-31 of CEAR Document #1188) Response to Sufficiency Information Request #32 (IR6-32 of CEAR Document #1188)
TWN-1.2	Asked if there is a Regional Study Area for air quality.	08-Oct-2014, Preliminary EIS Results Workshop #2	**08-Oct-2014, Workshop:** Responded that there is not a regional study area for air quality because it is expected that beyond the local study area, emissions concentrations related to the Project would decline to levels so low that they are unmeasurable. For example, the $PM_{2.5}$ concentration predictions image (referenced slide 21) shows the 12.5 micrograms per cubic meter contour line, which is essentially the background concentration measured at the Tsawwassen air quality monitoring station T39. Over land, concentrations with Roberts Bank Terminal 2 (RBT2 or Project) are predicted to be 1 or 2 micrograms per cubic meter, which is so low it is within the measurement uncertainty of $PM_{2.5}$ monitoring instruments.	**Addressed in EIS Section 9.2.5:** As noted in EIS Section 9.2.5, the focus of the assessment included locations on land where people may be exposed to contaminants and also included areas over water. The local study area was a 19 km by 16 km area and captured the extent to which the Project would have an influence on air quality. Meteorological modelling was carried out over a larger (26 km by 24 km) area to support the predictions of Project-related and cumulative changes to air quality.	**Environmental Impact Statement (EIS, CEAR Document #181)** 9.2 Air Quality 9.2.5 Methods 9.2.5.2 Study Area
TWN-1.3	Concerned with cumulative effects on air quality and the	08-Oct-2014, Preliminary	**08-Oct-2014, Workshop:** Responded that in that area of the Fraser Valley, one of the biggest sources of	**Addressed in EIS Section 9.2.8:** Potential impacts to air quality are discussed in EIS Section 9.2.8. The air quality assessment concludes that:	**EIS** 9.0 Physical Setting 9.2 Air Quality

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
	ability of wind to carry them into the valley (Chilliwack).	EIS Results Workshop #2	particulate matter is ammonia from the agricultural activities, combining with NO_x (nitrogen oxide) emissions from industry, as well as emissions generated by transportation activities along Highway 1, and forming ammonium nitrate. The same thing happens with sulphates, resulting in ammonium sulphate. It is a combination—it is not just emissions from the western part of the Fraser Valley, it is emissions from that part of the valley as well. The amount of NO_2 originating from Roberts Bank that reaches Chilliwack is very small, whereas the amount of ammonia being emitted from agricultural activity is large.	• Air quality in the region will improve in the future, with or without the Project, as a result of improvements in engine technologies as older equipment is replaced by newer equipment at the three existing marine terminals and the use of cleaner fuels. • Cumulative changes, incorporating the Project and other certain and reasonably foreseeable projects and activities, are predicted to be small relative to expected improvements in future ambient air quality levels. • Project construction activities are predicted to cause a small increase in concentrations of some contaminants, but will be mitigated through the use of emission reduction measures to limit fugitive dust emissions and a monitoring program to guide construction activity in the event that ambient air concentration exceed defined criteria threshold levels. • Criteria air contaminant (i.e., carbon monoxide, nitrogen oxides, sulphur dioxide, particulate matter, and ground-level ozone) and trace organic contaminants (i.e., formaldehyde and other contaminants related to fuel combustion) levels are predicted to be below ambient air quality criteria on land, with limited exceptions. The exceptions for predicted nitrogen dioxide levels near the causeway are considered to be an artefact caused by the conservative methods used in the air quality assessment, and are not expected to actually exceed established ambient air quality criteria. • The Project is expected to have a negligible effect on future ozone levels. • Although Project activities would emit black carbon, black carbon is expected to decrease in the future with the Project due to equipment fleet turnover at existing Roberts Bank terminals to newer engines that meet more stringent emission standards for particulate matter. The Project is not expected to result in any significant adverse effect on human health, including from changes in air quality because air quality is expected to improve. During operation, it is unlikely that Project-related exposures to air emissions would result in measurable health effects. The only residual effect associated with air quality changes would be experienced by individuals on the water near the terminal during construction due to short-term and infrequent dust generation. The benefits of existing initiatives are realised in the existing emissions monitored at local air quality stations in Metro Vancouver. Future benefits in improved air quality, such as improvements engine technology and fuel quality, are described based on their anticipated level of benefit to future air quality emissions. **Additional information provided by the VFPA:** The VFPA leads a suite of initiatives that reduce air emissions associated with key port activities: ships, trucks, cargo-handling equipment, and terminal activities. The VFPA's approach is to collaboratively work with industry and stakeholders in each sector to develop programs that respond to their unique operating context and meet industry leading environmental objectives. Key initiatives include the EcoAction Program, the Northwest Ports Clean Air Strategy, Air Emissions Inventories, Energy Action Initiative, and environmental requirements through the Truck Licensing Program. Information regarding VFPA's Air, Energy and Climate Action initiatives can be found at: https://www.portvancouver.com/environment/air-energy-climate-action/. As part of the Deltaport Third Berth Project (DP3), the VFPA funded the establishment of the Tsawwassen Air Quality Monitoring Station. The location of the station, at Pebble Hill Reservoir located at 411 Milsom Wynd in Delta, was chosen by the Delta Air Quality Monitoring Technical Working Group (composed of representatives from Corporation of Delta, Environment Canada, Metro Vancouver, Tsawwassen First Nation, and the VFPA). The station is comprised of state-of-the-art monitoring equipment including ozone and particulate monitoring technologies. Since this station is part of Metro Vancouver's regional air quality monitoring network, results from the station can be viewed in real-time at www.bcairquality.ca/readings. The analysis of the data from this station indicates that there has been a reduction in both sulphur dioxide (SO_2) and fine particulate matter ($PM_{2.5}$) concentrations measured at this monitoring station after the implementation of the requirements for low sulphur fuels from ships under the North American ECA regulations. Currently, the levels of SO_2, $PM_{2.5}$, and ground-level ozone meet the Canadian Ambient Air Quality Standards (CAAQS). CAAQS for nitrogen dioxide have not yet been defined, but are still being developed. The levels of carbon dioxide are well below the ambient air quality objectives established by Metro Vancouver.	9.2.5 Methods Appendix 9.2-A Air Quality Study Main Report Appendix A - Emissions Inventory and Appendix B – Existing Air Quality Appendix C - Air Dispersion Modelling Appendix F - Ships Underway 9.2.6 Existing Conditions Table 9.2-4 Air Quality Criteria for Criteria Air Contaminants Table 9.2-5 Air Quality Criteria for Toxic Organic Contaminants 9.2.7 Expected Conditions 9.2.8 Future Conditions with the Project 9.2.9 Future Conditions with the Project and Other Projects and Activities Appendix 9.2-A Air Quality Study: Appendix H Westshore Coal Dust Assessment

Table 2: Archaeological and Heritage Resources – Valued Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-2.1	Concerned that the draft Archaeological Overview Assessment is dismissive of the interests and rights of all First Nations other than Tsawwassen First Nation. Noted that the report does not mention Tsleil-Waututh Nation.	04-Feb-2014, Conversation-Comments on draft Archaeological Overview Assessment	**08-May-2014, Letter from the VFPA:** The ethnography section has been revised and also includes a listing of all First Nations that have a potential claim to the study area, according to GeoBC's Consultative Areas Database. EIS Appendix 28-A includes Tsleil-Waututh Nation and other First Nations as claiming an interest in the study area.	**Addressed in EIS Appendix 28-A:** As noted in EIS Appendix 28-A, the study area is located within the traditional lands of Tsawwassen First Nation, but other Indigenous groups also claim an interest to parts of the study area. According to GeoBC's Consultative Areas Database (CAD), the Hul'qumi'num Treaty Group, including the Cowichan Tribes, Halalt First Nation, Lake Cowichan First Nation, Lyackson First Nation, Penelakut Tribe, and Stz'uminus First Nation claim an interest; as do Stó:lō Nation, including Seabird Island Band, Soowahlie First Nation, Stó:lō Tribal Council, Shxw'owhamel First Nation, Skawahlook First Nation; Semiahmoo First Nation; and Tsleil-Waututh Nation. Musqueam First Nation does not include the area in their Statement of Intent but are being included in discussions with the port authority due to the proximity of their claim. Hwlitsum has also expressed an interest in the study area.	**EIS** Appendix 28-A Archaeological Overview Assessment
TWN-2.2	Requested that "cultural importance of resources" be changed to read: "cultural importance of land, waters, and resources."	09-May-2014, Letter	**09-May-2014:** Recorded comment for consideration by the Project team.	**Addressed in EIS Section 32.0:** Cultural importance of 'land and waters' are included as part of the assessment of current use of lands and resources for traditional purposes (Current Use), which includes information from a Tsleil-Waututh Nation Traditional Use Study.	**EIS** 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Land and Resources for Traditional Purposes
TWN-2.3	Requested that their archaeological permitting process be included in the archaeology section.	09-May-2014, Letter	**09-May-2014:** Recorded comment for consideration by the Project team.	**Additional information provided by the VFPA:** The Preliminary Field Reconnaissance and Archaeological Overview Assessment (AOA) work commissioned directly by the VFPA met all applicable/required laws/guidance. In this case, Millennia Research Limited and the VFPA were not required under any federal or provincial laws to obtain a permit for the Preliminary Field Reconnaissance nor AOA work; the resulting report (see EIS Appendix 28-A) notes it is a "Non-Permitted Report." Tsleil-Waututh Nation or Indigenous permitting processes in general have not been discussed in the AOA or environmental assessments. As noted in EIS Table 35-2, the VFPA will ensure that required statutory permits, approvals, and authorisations are in place prior to the commencement of the activity or activities to which they pertain.	**EIS** Appendix 29-A Roberts Bank Terminal 2 Technical Report, Archaeological Overview Assessment Table 35-2 Proposed Mitigation Measures and Commitments
TWN-2.4	Requested that 'Port Lands Best Practices' be added, as much of the ground disturbance may occur on federal Port Lands, where the provincial *Heritage Conservation Act* does not apply.	09-May-2014, Letter	**09-May-2014:** Recorded comment for consideration by the Project team.	**Addressed in EIS Section 28.0:** The applicability of the provincial legislation on federal lands is addressed in EIS Section 28.0, p. 3: "Although the B.C. *Heritage Conservation Act* applies only to provincial lands and does not apply to federal lands, the assessment has also been conducted in general conformance with the B.C. Archaeological Impact Assessment Guidelines (B.C. Archaeology Branch 1998)."	**EIS** 28.0 Archaeological and Heritage Resources 28.1 Component Overview and Regulatory Setting
TWN-2.5	Asked about archaeological potential in the subtidal zone, and for additional information about the deep water surveys carried out in the past.	29-Oct-2014, Preliminary EIS Workshop #4	**29-Oct-2014, Workshop:** Recorded comment for consideration by the Project team.	**Addressed in EIS Section 28.0:** Rationale for the spatial boundaries of the assessment of archaeological and heritage resources is included in EIS Section 28.0 and in the AOA that was conducted to support the EIS. The draft AOA was provided to Indigenous groups for review. The deep water subtidal zone, including the berth pocket, was not inspected as part of the AOA for this assessment because of its inaccessible depth, and the findings of previous assessments, which indicate low archaeological potential in an adjacent area (EIS Section 28.5.2.2). Archaeological survey coverage during the preliminary field reconnaissance was limited to a 100-m buffer outside the Project footprint. Sub-surface testing of the intertidal zone was not undertaken as the saturated sediments would have made testing any large area infeasible.	**EIS** 28.0 Archaeological and Heritage Resources 28.5.2.2 Archaeological Potential

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-2.6	Concerned with the ability to assess impacts to intangible heritage sites, and how the assessment was conducted. Concerned with the lack of an effects assessment and/or mitigation measures for impacts to intangible cultural heritage. Stated that in Volume 5, section 32.3.2.2, does not identify Tsleil-Waututh's concerns with the sacred landscape (especially the mystic tunnels and Stl'aleqem site and associated cultural practices). Stated that in Volume 5, section 32.3.2.2, the disruption to use of Tsleil-Waututh's sacred areas by the Project are described in terms of food harvesting activities only. Stated that in EIS Volume 1, Section 7.7.2.5 Summary of Aboriginal Group Issues and Interests, the effects to intangible cultural heritage (as described in the 2014 Tsleil-Waututh Nation Knowledge Study) is excluded. Stated that these cultural impacts are not described in 32.3.3.4 Outstanding Aboriginal Issues, despite their clear importance to Tsleil-Waututh. Requested funding to support an intangible cultural heritage study. Requested an increase of funding. Requested that the report be confidential.	29-Oct-2014, Preliminary EIS Workshop #4 15-Jun-2015, Letter to the Canadian Environmental Assessment Agency (CEA Agency; CEAR Document #249) 09-May-2017, Email 04-Mar-2018, Phone call	**29-Oct-2014, Workshop:** Responded that those matters are addressed in EIS Section 32.0. Stated that the potential effects to culture are assessed in the section on Aboriginal Rights and Interests. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **13-Oct-2015, Letter from the CEA Agency (CEAR Document #313):** *"The Agency has requested additional information on cultural heritage in its letter of July 31, 2015 to [the VFPA] (page 13, #29)."* **21-Aug-2017, Letter from the VFPA:** Offered funding to Tsleil-Waututh Nation on the following terms and conditions: a) to undertake community consultation, engaging with community members, council and knowledge holders to understand the extent of Tsleil-Waututh Nation's intangible cultural heritage at Roberts Bank; and b) to write a report for the VFPA describing the findings of this community engagement with a focus on potential impacts from the Project to Tsleil-Waututh Nation's intangible cultural heritage at Roberts Bank. The report should include recommendations for how the VFPA could mitigate any potential impacts the Project may have on this intangible cultural heritage. **13-Oct-2017, Letter from the VFPA:** Increased the funding offer to Tsleil-Waututh Nation as requested. **01-Nov-2017, Letter from Tsleil-Waututh Nation:** Accepted funding. **09-Apr-2017, Email from the VFPA**: Provided draft confidentiality language in relations to the report. **30-May-2017, Email from the VFPA:** Integrated feedback from Tsleil-Waututh Nation and provided an updated draft of the confidentiality language.	**Addressed in EIS Appendix 7.2-B (#179):** Cultural considerations, including culturally and/or spiritually important sites are included in EIS Section 32.0, where information relating to these sites was provided by Indigenous groups, in accordance with CEA Agency technical guidance (May 2014). Tsleil-Waututh Nation provided a Traditional Use Study to the VFPA for incorporation into EIS Section 32.0. Tsleil-Waututh Nation was provided with an opportunity to review the VFPA's summary of existing conditions for Tsleil-Waututh Nation for the EIS and provide comments prior to finalisation. **Addressed in responses to IR-7.31.15-29 and AIR-121.04.15-29:** As identified in EIS Section 32.2.8 "[w]ith the implementation of mitigation measures, residual Project-related effects on Current Use are expected to be negligible (i.e., not measurable or detectable), and are not assessed further." This conclusion applies equally to cultural heritage, based on the analysis provided in the EIS and in the VFPA's response to information requests. As no measurable residual effects are predicted, a significance determination is not required. **Addressed in response to IR13-19:** The VFPA's forthcoming response to IR13-19 will further discuss potential effects of shoaling on shoreline structures and sites of physical and cultural heritage importance.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Land and Resources for Traditional Purposes 32.2.8 Characterisation of Residual Effects and Context **Information Requests** Response to Information Request #29 (IR-7.31.15-29 of CEAR Document #314) Response to Additional Information Request #29 (AIR-12.04.15-29 of CEAR Document #388) Sufficiency Information Request #19 (IR13-19)

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
			01-Jun-2018: Tsleil-Waututh Nation submitted a report entitled "Intangible Cultural Heritage – Potential Impacts to Sacred Tunnels from the Proposed Roberts Bank Terminal 2 Project".		
TWN-2.7	Stated that in Volume 4, Section 28.5.1.3, Regional Archaeological Studies, Table 28-4: The description of DgRs 2 (the Tsawwassen site) is inaccurate and not up-to-date (see Areas 1996). Requested that it be updated.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #249)	**13-Oct-2015, Letter from the CEA Agency (CEAR Document #313):** *"The Agency did not request additional information from [the VFPA] on this item. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*		

Table 3: Coastal Birds – Valued Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Initial Proponent Response	Additional Information	Document and Section providing Additional Information
TWN-3.1	Concerned with bird strikes, particularly with respect to bird-vehicle collisions. Requested information on mitigation measures.	29-Oct-2014, Preliminary EIS Workshop #4	**29-Oct-2014, Workshop:** Responded that there are a couple of kinds of mitigation, one of them being the use of bird diverters along power lines, which makes the power lines more visible, so birds can avoid them. Stated that while bird diverters would not address bird-vehicle collisions, "additional mitigation will minimise effect" refers to a commitment to look at what other mitigation measures would be useful to address bird-vehicle collisions, such as reduced speed. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#99):** Vehicle collision-related mortalities are expected to be very low compared to population size and are not expected to affect the short- and long-term population viability of coastal birds, with the exception of barn owls. In the absence of mitigation, minor effects to the productive potential of the local assessment area (LAA) to support barn owl are predicted. The VFPA will work with transportation authorities and the Canadian Wildlife Service to develop and implement measures to mitigate potential effects to barn owls from vehicle collisions.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 15.0 Coastal Birds Table 15-12 Summary of Mitigation Measures to Address Adverse Project-related Effects on Coastal Birds
TWN-3.2	Asked if the results for predicted increases and decreases in productivity for bird species is based on ecosystem modelling. Requested additional information about the models used in the assessment.	20-Nov-2014, Health & Aboriginal Rights Workshop - Tsleil-Waututh Nation	**20-Nov-2014, Workshop:** Responded that two models were used for predicting productivity for birds. Post Meeting Note shared with Tsleil-Waututh Nation on 30-Nov-2014 stated: The models referred to in the assessment for coastal birds are the Shorebird Foraging Opportunity Models (EIS Volume 3, Appendix 15-B and Appendix 15-C, and the Roberts Bank Ecosystem Model (described in EIS Volume 3, Section 10.3). **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 15.0 on Coastal Birds.	**Addressed in EIS Section 15.0:** The scope and methods of the coastal birds assessment is described in the EIS. The Shorebird Opportunity Model evaluates food availability (biofilm and benthic invertebrates) for foraging shorebirds under different levels of predation risk, and assesses changes in physical factors (e.g., water velocity, wave height) on their ability to forage. The Ecosystem Productivity Model is discussed in EIS Section 10.3, EIS Appendices 10-B, -C, and -D.	**EIS** 10.3 Overview of Assessing Ecosystem Productivity Appendix 10-B Roberts Bank Ecopath with Ecosim and Ecospace Model Parameter Estimates Appendix 10-C Roberts Bank Ecosystem Model Development and Key Run Appendix 10-D Roberts Bank Spatial Ecosystem Model Sensitivity Analysis 15.0 Coastal Birds Appendix 15-C Overwintering Dunlin Foraging Opportunity
TWN-3.3	Stated that in Volume 3, Section 15.1.1, Cumulative Effects on Coastal Birds, and Appendix 15-F, Tsleil-Waututh requires a rationale for the exclusion of all coastal birds, except diving birds, in the cumulative effects assessment of coastal birds.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #249)	**13-Oct-2015, Letter from the CEA Agency (CEAR Document #313):** *"The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	**Addressed in EIS Section 8.1.9:** As noted in EIS Section 8.0, an assessment of future cumulative effects was conducted when a measurable adverse residual effect was predicted to occur to a valued component (VC) due to a Project-related interaction. The assessment was conducted to determine whether the Project's residual effect on the component could interact with the effects of other certain and reasonably foreseeable projects and activities. In EIS Section 15.0, productivity loss for diving birds is identified as the only measurable residual effect to coastal birds after mitigation, and therefore it was carried forward into a cumulative effects assessment. The assessment determines that cumulative effects are considered not measurable and therefore negligible, and no mitigation measures are proposed to reduce cumulative effects of the Project on coastal birds.	**EIS** 8.0 Environmental Assessment Methods 8.1.9 Cumulative Effects Assessment 15.0 Coastal Birds 15.9.1 Residual Effect - Characterisation of Loss of Productivity 15.11.3.1 Changes to Diving Bird Productivity

Table 4: Coastal Geomorphology – Intermediate Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-4.1	Concerned with the cumulative effects of wave action from increased vessel traffic. Asked whether the coastal geomorphology study considered the interaction between physical processes and vessel traffic. Stated that Tsleil-Waututh Nation is of the view that there are impacts to Aboriginal interests along the shoreline as a result of the cumulative impacts of vessel traffic, recreational boating, escort vessels, and other boating in and around the area.	03-Aug-2016, Issues Workshop - Tsleil-Waututh Nation, Métis Nation British Columbia, and Semiahmoo First Nation	**03-Aug-2016, Workshop:** Stated that ship traffic arriving at the terminal was not assessed as part of the wave study. The reason for that is a typical ship generates three waves if it is moving quickly. By the time ships that are calling at RBT2 are within a few kilometres of the terminal, they are moving quite slowly, and only small waves are generated. If the wind is blowing at a good velocity, over an hour there might be a wave every four seconds. The number of waves is in an order of magnitude more than the number of waves created by ship wake. Something like one hour of wind-generated waves amounts to the same amount of waves caused by all ships in the port in an entire year. It could be considered, but it would amount to a miniscule addition to the wave environment. Responded that the Project itself is not going to change recreational boating, and from an observer point of view, when you observe wake arriving at the shore, you will notice it on calm day; when you consider over a 12-month period how much geomorphic work (i.e., the moving of sediment and disturbing of the bed) happens over long windy periods, the science concludes that wake does not account for much of that work at all. As an example, it is noted that ship wake might have an effect on the collection of fish on a calm day, but that was not part of the coastal geomorphology assessment. Responded that the first and ultimate mitigation and avoidance measure was the relocation of the terminal out to subtidal water.	**Addressed in MSA Section 7.2:** As noted in MSA Section 7.2, an assessment of the wave environment was conducted to determine potential changes from vessel transits associated with the Project to wake-generated waves. Ship wake that is less than 10 cm in height is considered to be well within the range of natural conditions and therefore defines the threshold for consideration in the assessment. In Segment A (southern Strait of Georgia), the estimated Project-associated vessel wave heights are predicted to be equal to or less than 0.03 m due to the slow vessel speed observed in this segment. Thus, the vessel wake from Project-associated vessels are not expected to introduce new navigational hazards for small-craft operators in the southern Strait of Georgia during calm conditions. **Addressed in response to IR7-21:** As noted in the VFPA's response to IR7-21, although the probability slightly increases from Project-associated vessels (0.034% during calm conditions), wake-generated waves from Project-associated vessels will not result in a change to the shorelines in the marine shipping area due to the similarity of interaction at the shoreline from wake-generated and wind-generated waves. **Addressed in response to IR7-22:** The VFPA's response to IR7-22 discusses the potential effects of waves generated by Project-associated vessels during calm conditions on small craft engaged in activities in open water at various points and various distances from shore throughout the marine shipping area. For all segments discussed in the marine shipping area, vessel wakes from Project-associated vessels are not expected to introduce new navigational hazards for small-craft operators. The vessel wakes from Project-associated vessels are not expected to introduce new navigational hazards for small-craft operators, including operators undertaking fishing activities, because of the existing energetic wave climate.	**Marine Shipping Addendum (MSA, CEAR Document #316)** 7.2 Wave Environment **Information Requests** Response to Sufficiency Information Request #21 (IR7-21 of CEAR Document #1049) Response to Sufficiency Information Request #22 (IR7-22 of CEAR Document #1049)
TWN-4.2	Interested in a follow-up meeting to discuss coastal geomorphology in more detail.	03-Aug-2016, Issues Workshop - Tsleil-Waututh Nation, Métis Nation British Columbia, and Semiahmoo First Nation	**03-Aug-2016, Workshop:** Committed to follow-up. **12-Sep-2016, Meeting with Tsleil-Waututh Nation and Musqueam First Nation:** The VFPA held an issues workshop and discussed coastal geomorphology. Discussed the concerns raised to date on coastal geomorphology.		
TWN-4.3	Interested in whether there will be impacts from geomorphology processes in the U.S., and if the VFPA or the CEA Agency is engaging with the U.S. Asked who would be appointed for consultation with the U.S.	22-Oct-2013, Meeting	**22-Oct-2013, Meeting:** Stated that the current scope does not extend into the U.S.A., but regulators may ask for greater depth or input from the U.S.A. Stated that the VFPA cannot comment on the CEA Agency's process. **06-Jan-2014, Letter from the VFPA:** *"[The VFPA] does not yet know whether the CEA Agency intends to consult with U.S.A. regulators regarding the proposed Roberts Bank Terminal 2 Project. [The VFPA]*	**Addressed in EIS Appendix 7.2-B (#54):** Project-related changes to coastal geomorphology in the U.S.A. are not anticipated. The VFPA has undertaken initial engagement with the U.S. Environmental Protection Agency (EPA) and the Washington State Department of Ecology by introducing the Project and the VFPA. Project information was shared through key website links (Project website and the CEA Agency Project website). In addition, the VFPA discussed the Project with the U.S. EPA (Region 10) and offered to provide additional information about the Project, if requested.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests **Information Requests** Response to Sufficiency Information Request #17 (IR2-17 of CEAR Document #961)

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
			anticipates that we will receive further information from the CEA Agency once the EIS Guidelines are issued and the formal environmental assessment commences."	The VFPA will take direction from the CEA Agency and the B.C. Environmental Assessment Office (EAO) regarding trans-boundary engagement with U.S. agencies during all phases of the proposed Project. **Addressed in response to IR2-17:** The VFPA's response to IR2-17 includes additional clarification concerning the expected extent of changes to coastal geomorphology related to the proposed Project. Changes to coastal geomorphology and hydrodynamic conditions in areas on the south side of the existing Roberts Bank causeway, including the inter-causeway area and areas south of the BC Ferries terminal, that are related to the Project components on the north side of the causeway are not anticipated because areas on the south side are hydrodynamically isolated from the north side of the Roberts Bank causeway by deep water and the presence of the existing causeways. The only Project component expected to influence coastal geomorphology or hydrodynamics in the inter-causeway area is the expanded tug basin, which is expected to result in localised changes to the existing coastal landforms in that area. Changes to coastal geomorphology in the U.S.A. are not anticipated.	
TWN-4.4	Requested a better understanding of the geomorphology and impacts that may occur with Fraser River plume. Noted that the geomorphology scope looks limited.	22-Oct-2013, Meeting	**22-Oct-2013, Meeting:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Section 9.5 and EIS Appendix 7.2-B (#48):** Coastal geomorphology considers the physical processes such as waves and currents that change or maintain the physical environment of coastal areas. An assessment was undertaken to determine potential changes to coastal geomorphology as a result of the Project. The assessment consisted of three study approaches to determine the potential effects of changes to natural processes from the Project footprint in subtidal and intertidal areas. Studies were informed by dialogue with the Coastal Geomorphology Technical Advisory Group. The results of the coastal geomorphology assessment were considered in the assessments of surficial geology and marine sediment, marine water quality, marine vegetation, marine invertebrates, marine fish, marine mammals, coastal birds, ongoing productivity of commercial, recreational, and Aboriginal fisheries, and archaeological and heritage resources. The Project layout and configuration has been modified to reduce the potential for a number of adverse changes to geomorphology during Project construction and operation. For example, developing the terminal almost entirely within the subtidal zone of Roberts Bank will largely avoid changes to geomorphology. Changes to coastal geomorphology are not expected from terminal development activities, but are related to the terminal footprint itself. The footprint will interact with tidal currents and wind-generated waves resulting in alterations to sediment transport, sediment erosion and deposition, and water flow exchange in the construction and operation phases. During causeway construction, drainage channels are expected to form on the tidal flats adjacent to the causeway. This change will occur during construction only, and will be temporary and reversible. As noted in EIS Table 35-2, the VFPA is committed to ensuring potential adverse effects of temporary channel formation related to tidal waters drainage during causeway dyke construction are reduced through detailed design. Changes from the expansion of the tug basin include the conversion of local tidal flats to subtidal waters. Although the formation of additional tidal channels is not anticipated, a small increase in the size of an existing channel is likely.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 9.5 Coastal Geomorphology 9.5.8 Future Conditions with the Project Table 9.5 5-6 Predicted Morphological Changes from the Project Footprint Figure 9.5-35 Approximate Spatial Extent of Potential Changes Associated with the Project Footprint Appendix 9.5-A Roberts Bank Terminal 2 Technical Report, Coastal Geomorphology Study 9.6 Surficial Geology and Marine Sediment 9.6.8 Future Conditions with the Project. 9.7 Marine Water Quality 9.7.8 Future Conditions with the Project. 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current Use of lands and resources for traditional purposes 35.0 Effects Assessment Summaries Table 35-2 Proposed Mitigation Measures and Commitments

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
				No incremental cumulative changes in coastal geomorphology are anticipated as a result of the Project in combination with other projects and activities. The spatial distribution of fresh water (carried by the Fraser River plume) in the area on the north side of the causeway is expected to change as a result of the Project. As a result of the terminal footprint, localised changes in salinity and turbidity are predicted in the intertidal zone, but within the natural ranges currently experienced. The Project is not expected to result in incremental cumulative changes to marine water quality.	
TWN-4.5	Asked if a contamination assessment has been done on materials potentially used for dredging and disposal at sea.	07-Oct-2014, Preliminary EIS Workshop #1	**07-Oct-2014, Workshop:** Stated that this will be part of the EIS. The material used as fill will be Fraser River sand that would otherwise be disposed of at sea. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#55):** Dredging and disposal at sea (DAS)-related activities are described in the EIS and considered in the assessment of potential effects on marine physical and biophysical components. As described in the EIS, the physical and chemical characteristics of sediments that will be affected by construction activities, including sediments that will be re-suspended during dredging activities, were investigated and results were compared to recommended quality guidelines and regulatory criteria. Outcomes from the marine water quality assessment regarding total suspended sediment concentrations associated with dredging and dumping activities informed the assessment of marine vegetation, marine invertebrates, marine fish, marine mammals, coastal birds, ongoing productivity of commercial, recreational, and Aboriginal fisheries, and outdoor recreation. **Addressed in EIS Appendix 7.2-B (#56):** Current levels and potential changes in marine sediment and water quality, including changes in salinity and contaminants, were evaluated as described in the intermediate component (IC) assessment sections (EIS Sections 9.6 and 9.7). Potential changes to marine water quality and sediment quality or sediment deposition due to the Project are expected to be minimal, relative to existing natural variability in the ecosystem. Sediment that will be re-suspended or disposed of during construction activities are not contaminated. With the exception of temporary, reversible changes in the biofilm community assemblage from salinity changes during freshet, the potential effects of Project-related changes in marine water quality and sediment quality on marine vegetation, marine invertebrates, marine fish, and marine mammals are considered to be negligible due to the range of conditions that marine species naturally experience. **Addressed in Information Request Package 3 Preamble in Support of Responses to IR3-25 to IR3-40:** Based on information provided by Environment and Climate Change Canada (ECCC; CEAR Document #564), discharge of supernatant containing unsettled fines from the containment dykes during filling is not expected to be subject to DAS permitting. For further information concerning this change, please see Information Request Package 3 Preamble in Support of Responses to IR3-25 to IR3-40.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 9.6 Surficial Geology and Marine Sediment 9.6.8 Future Conditions with the Project 9.7 Marine Water Quality **Information Requests** IR Package 3 Preamble in Support of Responses to IR3-25 to IR3-40 – General and Disposal at Sea-related Project Construction Update (CEAR Document #928)
TWN-4.6	Asked about consultation for DAS, and additional information.	08-Jun-2016, Meeting	**08-Jun-2016, Meeting:** Stated that the VFPA is working on putting information together for DAS and it will be ready in the coming months. Offered to provide sections of EIS with DAS information.	**Addressed in PCU:** As requested by the RBT2 Review Panel, the VFPA submitted the PCU on June 12, 2018, providing: • Detailed revised Project description, including a revised construction schedule;	**Project Construction Update (PCU; CEAR Document #1210)** 1.0 Introduction 2.0 Revised Project Description and Schedule

			17-Jun-2016, Email from the VFPA: Below, I have listed the EIS sections where DAS is discussed. 4.0 Project Description • 4.4.1 Project Activities, Construction Phase Activities • Table 4-5 Source and Quantities of Material Requiring Disposal at Sea • Figure 4-21 Intermediate Transfer Pit and Disposal at Sea Candidate Locations 8.0 Effects Assessment Methods • Table 8-1 Intermediate Component and Valued Component Linkages 9.0 Physical Setting • 9.6 Physical Setting, Surficial Geology and Marine Sediment • 9.6.5 Methods • 9.6.6 Surficial Geology and Marine Sediment, Existing Conditions • 9.6.8 Future Conditions with the Project • Appendix 9.6-C Roberts Bank Terminal 2 Technical Report, Dredging Studies – Dispersion Modelling • 9.7 Physical Setting, Marine Water Quality 11.0 Marine Vegetation • 11.6.3 Potential Effect – Changes in Productivity 12.0 Marine Invertebrates • 12.6.3 Potential Effect – Changes in Productivity 13.0 Marine Fish • 13.6.3 Potential Effect – Changes in Productivity **26-Jun-2017, Letter from the VFPA:** *"I am pleased to confirm that as a result of work undertaken over the past year to address concerns raised by Tsleil-Waututh Nation and other Aboriginal groups, and to reduce potential environmental effects from the proposed Roberts Bank Terminal 2 ("RBT2") Project, we have determined that the intermediate transfer pit ("ITP") is no longer required as a temporary storage location to support project construction.* *The concerns brought forward by Tsleil-Waututh Nation with regard to Dungeness Crabs and disposal at sea highlighted the need for the Vancouver Fraser Port Authority ("the port authority") to re-evaluate our planned construction approach and use of the ITP as a part of the RBT2 Project. The RBT2 Project Team has been actively exploring alternative construction methods to address concerns raised by Aboriginal groups and regulatory agencies since the development of the Environmental Impact Statement in 2014.* *After undertaking a thorough investigation that included further engineering work, consideration of new locally available dredging equipment, and relaxation of the Coasting Trade Act as a result of approving the Canadian European Trade Agreement, the port authority determined that the RBT2 Project could proceed without the use of an*	• Revised Project interaction matrix; • Preliminary details pertaining to the management and timing of dredging activities and the discharge of sediment-laden water; and • Revised assessment of environmental effects as required by the Project modifications. Sections 1.0 and 2.0 of the PCU describe the changes to the EIS, including updates to specific construction activities, the construction schedule, and relevant Project description figures and appendices. In PCU Section 3.0, changes or effects resulting from the construction updates on ICs and VCs are described. Overall, these changes to the environmental assessment resulting from construction updates can generally be summarised as follows: • Reductions in potential adverse changes or effects on ICs, biophysical VCs, social VCs, and Current Use; and • Increases in positive interactions with socio-economic VCs. These beneficial changes to ICs and VCs occur at the level of interactions or potential effects, and in most cases are slight changes, and thus do not affect the overall conclusions made in the EIS, including proposed mitigation, residual effect characterisations, significance determinations or cumulative effects, as applicable, with one exception. The only component predicted to have a change to residual effects is land and water use, with a reduction of a residual effect on access to Tsawwassen First Nation community lease lands from a measurable non-significant residual effect to a negligible residual effect, due to elimination of the ITP and associated activities.	3.0 Summary of Changes to the Environmental Impact Statement **Information Requests** From the Vancouver Fraser Port Authority to the Review Panel re: Project Construction Update (See Reference Document #995) – CEAR #1210

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
			ITP. In addition, the elimination of the ITP, along with other changes will result in a Project that does not require a Disposal at Sea permit."		
TWN-4.7	Asked how long it will take for the sediment to accumulate and how will it be managed.	08-Oct-2014, Preliminary EIS Results Workshop #2	**08-Oct-2014, Workshop:** Confirmed that the question is in reference to the area of scour and zone of deposition identified in slide 32. Stated that it may take up to ten years for sediment to stop moving around and reach a relatively stable geometry. Explained that this area needs to scour because flow is accelerating. However, as the bed gets progressively deeper, the average velocity gets slower and slower and eventually everything stops moving. As such, once it has adjusted to the new condition it will not move anymore. Suggested mitigation has been to pre-dredge that area so sediment is not available to re-distribute, but the VFPA does not know what effect that will have on the seabed. Further investigation and information is required by the people studying other ecological functions. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Section 9.5 and EIS Appendix 9.5-A:** EIS Section 9.5 presents the technical studies that describe the adjustments to the seabed that are expected to occur in response to the proposed terminal. **Addressed in EIS Appendix 7.2-B:** The results of the coastal geomorphology assessment were considered in the assessments of surficial geology and marine sediment, marine water quality, marine vegetation, marine invertebrates, marine fish, marine mammals, coastal birds, ongoing productivity of commercial, recreational, and Aboriginal fisheries, and archaeological and heritage resources. The Project layout and configuration has been modified to reduce the potential for a number of adverse changes to geomorphology during Project construction and operation. For example, developing the terminal almost entirely within the subtidal zone of Roberts Bank will largely avoid changes to geomorphology.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 9.5 Coastal Geomorphology 9.5.8 Future Conditions with the Project Appendix 9.5-A Roberts Bank Terminal 2 Technical Report, Coastal Geomorphology Study
TWN-4.8	Requested clarification as to whether or not escort vessels were included in the wake effects assessment, individually and cumulatively. Concerned about any potential impacts to shoreline archeological features. If escort vessels were not included, this is a gap to be remedied.	18-Dec-2015, Letter to the CEA Agency (CEAR Document #379)	**12-May-2016, Letter from the CEA Agency (CEAR Document #399):** *"The Agency did not request additional information regarding VC selection since there is already some information provided in the marine shipping addendum. Section 4.2.2.7 indicates that no escort vessels will be required."* **04-Feb-2016, Email from the VFPA:** *"Project-related tugboat activities do not occur within marine shipping area, and as such, tugboat activities were not assessed in the [MSA]. Escort tugs will be used to safely assist ships into and out of the berth (See EIS Section 3.2.2.1 Container Ship Manoeuvres and Figure 4-26 Container Ship and Tug Support Key Locations Map), and these activities occur within the original Project area and [the VFPA's] jurisdiction.* *In the EIS, Section 9.5 Coastal Geomorphology assesses considers the physical processes such as waves and currents that change or maintain the physical environment of coastal areas. An assessment was undertaken to determine potential changes to coastal geomorphology as a result of the Project, including changes to natural processes from the Project footprint in subtidal and intertidal areas. A detailed analysis of potential changes to geomorphology at Roberts Bank from ship (or tug boat) wake was not conducted as the number and size of waves generated by the additional shipping in the area was anticipated to be very small relative to the overall wind-induced wave climate in the area."*	**Addressed in MSA Section 4.2.2.7:** Container ships do not require tugboat escort while transiting through Segments A to D. It is anticipated that the same will apply to the additional container ships associated with RBT2. All tugboat activity for the Project-associated container ships will be near the terminal as described in EIS Section 4.4.2.1. **Addressed in MSA Section 7.2:** As noted in MSA Section 7.2, an assessment of the wave environment was conducted to determine potential changes from vessel transits associated with the Project on wake-generated waves. Available data suggest that predicted wake wave heights arriving at shorelines within the LAA are well within the range of natural wave conditions, and are not distinguishable from the spectrum of wind-generated waves, except in non-calm conditions. **Addressed in response to IR10-21:** The VFPA's response to IR10-21, as requested by the Review Panel, discusses potential project effects to sites of physical and cultural importance to Indigenous peoples. **Addressed in response to IR10-23:** The VFPA's response to IR10-23, as requested by the Review Panel, discusses potential loss or deterioration of archaeological sites resulting from natural and ship-wake waves greater than 10 cm.	**MSA** 4.2.2.7 Tugboat Escort 7.2 Wave Environment **Information Requests** Response to Sufficiency Information Request #21 (IR10-21) Response to Sufficiency Information Request #23 (IR10-23)

Table 5: Effects Assessment Methods (including Cumulative Effects)

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-5.1	Concerned with the process for determining cumulative effects, including the assessment of impacts "in silos" by VCs which results in the exclusion of VCs from the cumulative effects assessment. Concerned with the determination of no adverse cumulative effects.	15-Dec-2015, Meeting	**15-Dec-2015, Meeting:** Responded that cumulative effects were assessed in accordance with the methods laid out in the *EIS Guidelines*. Stated that the VFPA studied all of the VCs through an ecosystem model.	**Addressed in EIS Appendix 7.2-B (#34):** The methods used to assess the potential effects of the Project, including both residual effects of the Project and cumulative effects, are described in EIS Section 8.0. The environmental assessment for the Project was developed to meet the requirements specified in the *EIS Guidelines* and consistent with existing guidance documents, including the Operational Policy Statement Assessing Cumulative Environmental Effects Under the *Canadian Environmental Assessment Act* (*CEAA*), *2012*, Determining Whether a Project is Likely to Cause Significant Adverse Environmental Effects, the Cumulative Effects Assessment Practitioners' Guide, and the *Guideline for the Selection of Valued Components and Assessment of Potential Effects*, among others. Where measurable residual effects to a VC have been predicted to result from the Project, a cumulative effects assessment was conducted to determine whether Project-related residual effects are likely to interact cumulatively with the effects of other projects and activities. Similarly, where Project-induced changes to an IC were expected, the potential for those changes to combine cumulatively with changes caused by other projects and activities was assessed. In most cases, the assessment of future cumulative effects was conducted within the boundaries of the regional assessment area (RAA) identified for the VC. For certain VCs, however, the cumulative effects assessment boundaries differed. In all cases, the rationale supporting the selection of spatial boundaries for the assessment of cumulative effects or changes on a VC or IC is provided in the corresponding section of the EIS. Where the Project was predicted to contribute to incremental cumulative effects, additional mitigation measures were considered. The VFPA then determined the significance and likelihood of any adverse residual cumulative effects following the implementation of mitigation measures.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 8.0 Effects Assessment Methods ***Updated Guidelines for the Preparation of an Environmental Impact Statement (EIS Guidelines*; CEAR Document #177)**
TWN-5.2	Asked about the study area for the cumulative effects assessment.	08-Oct-2014, Preliminary EIS Results Workshop #2	**08-Oct-2014, Workshop:** Responded that the study area is the same as the regional study area; limited to what is happening in the Strait of Georgia, and on the Fraser River.	**Addressed in EIS Section 8.0:** In most cases, the assessment of future cumulative effects was conducted within the boundaries of the RAA identified for the VC (see EIS Section 8.1.3). For certain VCs, however, the cumulative effects assessment boundaries differed from those of the RAA. In all cases, the rationale supporting the selection of spatial boundaries for the assessment of cumulative effects or changes on a VC or IC, respectively, is provided in the corresponding section.	**EIS** 8.0 Effects Assessment Methods
TWN-5.3	Interested in the selection process for proxy (representative) species. Asked whether it is normal to assess species by proxy.	03-Aug-2016, Issues Workshop - Tsleil-Waututh Nation, Métis Nation British Columbia, and Semiahmoo First Nation	**03-Aug-2016, Workshop:** Responded that in the context of the marine fish assessment, to be as conservative as possible, the species that spent the greatest amount of the time in the Project area were selected. Also, existing literature was reviewed to inform the decision to select Chinook and chum since they are most likely to interact with the Project. Assessing species by proxy is normal in the context of an environmental assessment. It is explained that ecosystems are	**Addressed in EIS Section 8.0:** Subsequent to VC selection, VC sub-components were identified to further structure and streamline the assessment as appropriate. For example, for biophysical VCs, sub-component species or groups were chosen for their ability to represent other species that are similar in nature, occupy comparable types of habitats, serve similar ecological roles, or could otherwise be affected by the Project in an analogous way. In selecting representative species, or in some cases species groups, consideration was given to species of specific importance to regulatory agencies, Indigenous groups, and the public, as identified by community knowledge and Indigenous traditional knowledge (ITK), and during consultation and engagement, and assessment planning. **Addressed in Information Request Package 5 – Response to Information Requests Relating to Represented Species:** Representative species and their use in the assessment is further discussed in the VFPA's response to Information Request Package 5. The representative species approach was taken as it would be impractical to characterise existing conditions and	**EIS** 8.0 Effects Assessment Methods **Information Requests** Information Request Package 5 – Response to Information Requests Relating to Represented Species (CEAR Document #1078)

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
			incredibly complex and it is not feasible to look at every single species. The species list for Roberts Bank is long and where possible, effort was made to group things.	assess effects a on every species that may frequent the Roberts Bank area. In this way, the use of VCs, sub-components, or representative species improves the effectiveness and efficiency of assessment by focusing on the key Project interactions.	
TWN-5.4	Asked whether there were maps that could show the distribution of species for each VC, including eelgrass. Stated that providing general areas would be helpful to gain a better understanding.	06-Jun-2014, Valued Components Workshop #1	**06-Jun-2014, Workshop:** The *Zostera marina* bed is lower in the intertidal area, and *Zostera japonica* is closer to shore. Noted that huge beds of *Zostera marina* are present on the east side of the causeway where it is calmer. Noted that the VFPA has maps for some species, one is being worked on for inclusion in the EIS, and added that it is challenging in such a dynamic system. Reviewed location of macroalgae, biomat, and biofilm. Also reviewed the LAA and RAA for marine vegetation VC. **28-Oct-2014:** Marine vegetation was discussed during Aboriginal Group EIS Workshop #3 and included a map on the existing conditions of marine vegetation, including eelgrass. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Figure 11-2.	**Addressed in EIS Section 11.0:** Figure 11-2 depicts distribution of marine vegetation sub-components.	**EIS** 11.0 Marine Vegetation
TWN-5.5	Asked about the distinction between intermediate components (ICs) and valued components (VCs).	08-Oct-2014, Preliminary EIS Results Workshop #2	**08-Oct-2014, Workshop:** Responded that ICs inform the VCs, for which we then look at the effects, and what mitigation applies. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 8.0 on Effects Assessment Methods.	**Addressed in EIS Section 8.0:** The distinction between VCs and ICs is further explained in the EIS. VCs are the physical, biophysical, and human environment that may be affected by the Project that have been identified to be of concern by the proponent, government agencies, Indigenous peoples, and the public. The components along the pathway through which the effect is transmitted are referred to as ICs for the purposes of this assessment. Linkages between the ICs and VCs are shown in EIS Table 8-1.	**EIS** 8.0 Effects Assessment Methods 8.1.2 Selection of Valued Components Figure 8-1 Valued Component Selection Process Figure 8-2 Example of Pathway of Effects Table 8-1 Intermediate Component and Valued Component Linkages

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-5.6	Stated that Tsleil-Waututh Nation is looking for examples and best practices that can be carried forward to a new and improved CEA Agency process. Commented that the food web modelling is good material.	03-Aug-2016, Issues Workshop - Tsleil-Waututh Nation, Métis Nation British Columbia, and Semiahmoo First Nation	**03-Aug-2016, Meeting:** Committed to sending Tsleil-Waututh Nation more information on the food web model. Responded that the overall effects assessment in the EIS used a multiple lines of evidence approach; there are limitations to modelling and a certain amount of uncertainty. Certain project interactions could not be captured by the model and they had to be addressed qualitatively. The model was used because it provides quantitative output, and enables quantification of effects within a given area. Other factors considered were traditional knowledge and professional judgment. These multiple lines of evidence were integrated and considered to make the final assessment conclusions.	**Addressed in response to Information Request Package 3 Preamble in Support of Responses to IR3-01 to IR3-24:** Addressed in Information Request Package 3 Preamble in Support of Responses to IR3-25 to IR3-40: In its response to Information Request Package #3 (Part 1 Ecosystem Modelling (IR3-01 to IR3-24)), the VFPA provides further discussion concerning the Roberts Bank ecosystem model (food-web model). Specifically, *Information Request Package 3 Preamble in Support of Responses to IR3-01 to IR3-24 – Roberts Bank Ecosystem Model* provides further context and background to the VFPA's responses on the Roberts Bank ecosystem model. As noted in the response, the Roberts Bank ecosystem model supports the VFPA's overall conclusions about potential effects of RBT2, including the following: • Changes in productivity from the terminal and causeway footprint are relatively small, especially in the context of the Strait of Georgia basin; • Before mitigation (including offsetting), the Project increases overall productivity within Roberts Bank; • Primary losses in productivity, as determined by the Roberts Bank ecosystem model are in the subtidal (and this is intuitive given the terminal is primarily located in the subtidal region); and • The Strait of Georgia's environment (e.g., currents, water quality, species distribution or abundance) will continue to influence the Roberts Bank ecosystem, with or without RBT2.	**Information Requests** Information Request Package 3 Preamble in Support of Responses to IR3-01 to IR3-24 (CEAR Document #984)
TWN-5.7	Concerned with the CEA Agency's decision that marine shipping activities are not going to be assessed as part of the designated project under *CEAA 2012*. Concerned that marine shipping will not be considered in the panel's evaluation of the Project.	15-Dec-2015, Meeting	**15-Dec-2015, Meeting:** Recorded comment for consideration by the Project team. **30-Sep-2017, Letter from the VFPA:** Provided Tsleil-Waututh Nation with a copy of the AIMSA, including Appendix 2-B summarised issues raised by Tsleil-Waututh Nation and the VFPA's responses.	**Addressed in AIMSA Appendix 2-B (#5):** The scope of the Project to be assessed is defined by the CEA Agency. The VFPA advised the CEA Agency of this concern through Appendix 2-B (#5) of the AIMSA. **Addressed in *Updated EIS Guidelines*:** On April 17, 2015, the CEA Agency issued *Updated EIS Guidelines* that included the addition of environmental effects of marine shipping associated with the Project, beyond the scope of the Project (VFPA jurisdiction) to the 12 nautical mile limit of Canada's territorial sea. In October 2015, the VFPA submitted to the CEA Agency the MSA. **Additional information provided by the VFPA:** The VFPA understands that marine shipping associated with the Project outside of VFPA's jurisdiction is not formally considered to be part of the Project for the purposes of the Minister's decision whether the Project is likely to cause significant adverse environmental effects. However, the MSA provides information to the federal government regarding the potential effects of marine shipping associated with the Project, which can be used to inform programs or activities within federal jurisdiction.	**Additional Information to the MSA – Musqueam First Nation and Tsleil-Waututh Nation (AIMSA; CEAR Document #572)** Appendix 2-B Aboriginal Issues and Interests
TWN-5.8	Stated that Tsleil-Waututh Nation is not limited by the Canadian-United States border in the past, present or future.	27-Jun-2016, Email	**27-Jun-2016:** Recorded comment for consideration by the Project team. **30-Sep-2017, Letter from the VFPA:** Provided Tsleil-Waututh Nation with a copy of the AIMSA, including Appendix 2-B	**Addressed in AIMSA Appendix 2-B (#5):** As requested by Tsleil-Waututh Nation, the VFPA has added a clarifying statement to this effect in AIMSA Section 7.2.2.1: *"An overview of Tsleil-Waututh's past and current marine resource use for traditional purposes is presented in Section 32.2.4.4 of the EIS (pp. 32-65 to 32-66). As described in that section, Tsleil-Waututh's Consultation Area, shown in Figure 7-2, overlaps a portion of Segment E of the Marine Shipping Area, and specifically Canadian waters within Boundary Bay. Tsleil-Waututh Nation have clarified that their use is not limited by the international border, whether in the past, present, or future."*	**AIMSA** Appendix 2-B Aboriginal Issues and Interests 7.0 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights 7.2.2.1 Marine Resource Use

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
			summarised issues raised by Tsleil-Waututh Nation and the VFPA's responses.		
TWN-5.9	Requested that "Aboriginal groups" be included in point 2.1c (pg. 1) or the TOR so that it is changed to: "comments from Aboriginal groups and the public that are received in accordance with *CEAA 2012*".	22-Sep-2014, Letter to the CEA Agency (CEAR Document #128)	**24-Apr-2015, Letter from the CEA Agency (CEAR Document #283):** *"Section 2.1 is based on the wording in the* Canadian Environmental Assessment Act 2012*, and as such, Aboriginal groups would be included under the term 'the public'. However the Minister of the Environment has set up sections 3.6 to 3.11 to reflect the unique obligations related to Aboriginal consultation between the Crown and Aboriginal groups."*		
TWN-5.10	Requested that in the spirit of meaningful engagement with Aboriginal groups, point 2.1i (pg. 2) of the TOR be changed to: "as provided in subsection 19(3) of *CEAA 2012*, the environmental assessment by the Review Panel shall meaningfully take into account community knowledge and Aboriginal traditional knowledge".	22-Sep-2014, Letter to the CEA Agency (CEAR Document #128)	**24-Apr-2015, Letter from the CEA Agency (CEAR Document #283):** *"The wording in section 2.1(i) reflects the requirements in* CEAA 2012 *to consider [ITK]. For further information, see the Canadian Environmental Assessment Agency's (Agency) website for additional clarity on inclusion of Aboriginal traditional knowledge in the EA process: http://www.ceaa-acee.gc.ca/default.asp?Lang=en &n-C3C7EOD3-1 &offset-& toe-hide"*		
TWN-5.11	Requested that "Aboriginal groups" be included in point 3.2c (pg. 2) of the TOR, so that it is changed to: "hold hearings in a manner that offers any interested party, including Aboriginal groups, an opportunity to participate in an environmental assessment''.	22-Sep-2014, Letter to the CEA Agency (CEAR Document #128)	**24-Apr-2015, Letter from the CEA Agency (CEAR Document #283):** *"The wording in 3.2 reflects the requirements of* CEAA 2012*. In the Terms of Reference, Part 4- The Environmental Assessment Process under section Stage 2- Public Hearing gives direction to the Review Panel to consider the preferences of Aboriginal groups when setting up the public hearings."*		
TWN-5.12	Requested that "Aboriginal groups" be included in point 3.2dii (pg. 2) of the TOR, so that it is changed to: "a summary of any comments received from Aboriginal groups, the public, and any other interested parties".	22-Sep-2014, Letter to the CEA Agency (CEAR	**24-Apr-2015, Letter from the CEA Agency (CEAR Document #283):** *"Section 3.10 directs the Review Panel to provide a summary of*		

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
		Document #128)	*the information received from Aboriginal groups in the Review Panel Report."*		
TWN-5.13	Requested that "Aboriginal groups" be included in the last sentence of section 4.3 (pg. 4) of the TOR, so that it is changed to: ''The Review Panel shall notify Aboriginal groups and the public of any clarifications to its terms of reference". Requested that "Aboriginal groups" be included in the last sentence of section 4.4 (pg. 4) of the TOR, so that it is changed to: ''The Review Panel shall notify Aboriginal groups and the public of any clarifications to its terms of reference". Requested clarification on section 4.7 (pg. 4) of the TOR, regarding the statement. Asked who is the Agency making the EIS review and comment period available for? If "the public", Tsleil-Waututh requests that "Aboriginal groups" are also included as separate from the public in this statement. Requested that "Aboriginal groups" be included in the first sentence of section 4.20 (pg. 6) of the TOR, so that it is changed to: "The Review Panel shall notify Aboriginal groups and the public of experts retained by the Panel, and any documents obtained or created by experts that are submitted". Requested that "Aboriginal groups" be included in section 4.32 (pg. 7) of the TOR, so that it is changed to: "Upon receiving the report submitted by the Review Panel, the Minister will advise Aboriginal groups and the public that the report is available".	22-Sep-2014, Letter to the CEA Agency (CEAR Document #128)	**24-Apr-2015, Letter from the CEA Agency (CEAR Document #283):** *"The proposed change[s] [have] been made."*		
TWN-5.14	Requested that the following projects are included in Appendix 11-A and Appendix 12-B of the EIS: Fraser Surrey Docks Direct Coal Transfer Facility (Surrey, BC), George Massey Tunnel Replacement Project (Richmond and Delta, BC) and the Vancouver Airport Fuel Delivery Project (Richmond, BC). Stated that it is negligent to assume that these projects will not have an exponential adverse effect for Marine Vegetation (Appendix 11-A) and Marine Invertebrates (Appendix 12-B).	22-Sep-2014, Letter to the CEA Agency (CEAR Document #128)	**13-Oct-2015, Letter from the CEA Agency (CEAR Document #313):** *"The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	**Addressed in EIS Appendices 11-A and 12-B:** Rationale for exclusion of these projects is provided in EIS Appendix 11-A: Fraser Surrey Docks Direct Coal Transfer Facility: No potential for cumulative interaction with marine vegetation due to the project's distant location from Roberts Bank. George Massey Tunnel Replacement Project: The Project is potentially relevant to marine vegetation through potential water quality and sedimentation effects (i.e., elevated total suspended solids (TSS) levels and sedimentation during construction from removal of existing tunnel or changes to riverbed morphology and sediment redistribution following tunnel removal). Due to the preliminary stage of this project, publicly available information is limited but it is assumed that mitigation will be implemented. Any influence or change to the physical environment from this project is therefore likely to be negligible relative to the RBT2 scale of influence. Vancouver Airport Fuel Delivery Project: Potentially relevant to the marine vegetation assessment, but any influence or change to the physical environment from this project is likely to be negligible relative to the RBT2 scale of influence.	**EIS** Appendix 11-A Rationale for Exclusion of Other Certain and Reasonably Foreseeable Projects and Activities in the Cumulative Effects Assessment of Marine Vegetation Appendix 12-B Rationale for Exclusion of Other Certain and Reasonably Foreseeable Projects and Activities in the Cumulative Effects Assessment of Marine Invertebrates

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
				Rationale for exclusion of these projects is provided in the EIS Appendix 12-B: Fraser Surrey Docks Direct Coal Transfer Facility: No potential for cumulative interaction with marine vegetation due to the project's distant location from Roberts Bank. George Massey Tunnel Replacement Project: Project is potentially relevant to marine invertebrates through potential water quality and sedimentation effects (i.e., elevated TSS levels and sedimentation during construction from removal of existing tunnel or changes to riverbed morphology and sediment re-distribution following tunnel removal). Due to the preliminary stage of this project, publicly available information is limited but it is assumed that mitigation will be implemented. Any influence or change to the physical environment from this project is therefore likely to be negligible relative to the RBT2 scale of influence. Vancouver Airport Fuel Delivery Project: Potentially relevant to this marine invertebrates assessment, but any influence or change to the physical environment from this project is likely to be negligible relative to the RBT2 scale of influence.	
TWN-5.15	Requested that the George Massey Tunnel Replacement Project, Pattullo Bridge Replacement Project, Woodfibre LNG, and Burnco Aggregate Project be included in the cumulative effects assessments of Marine Fish (Appendix 13-C) and Marine Mammals (Appendix 4-A).	22-Sep-2014, Letter to the CEA Agency (CEAR Document #128) 18-Dec-2015, Letter to the CEA Agency (CEAR Document #379)	**13-Oct-2015, Letter from the CEA Agency (CEAR Document #313):** *"The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."* **12-May-2016, Letter from the CEA Agency (CEAR Document #399):** *"The Agency requested additional information on cumulative effects in AIR #6 Additional Projects to be Considered and AIR #7 Reasonably Foreseeable Projects and Activities."*	**Addressed in EIS Appendices 13-C and 14-C:** Rationale for exclusion of these projects is provided in the EIS Appendix 13-C: George Massey Tunnel Replacement Project: Project relevant to marine fish assessment through potential water quality and sedimentation effects. Mitigation will likely be implemented; however, a lack of pertinent publicly available information limits its inclusion as part of this assessment. Pattullo Bridge Replacement Project: Project relevant to marine fish assessment through potential water quality and sedimentation effects (i.e., elevated TSS and sedimentation anticipated during construction as a result of dredging for access by construction equipment and barges and installation of bridge support structures). Mitigation will likely be implemented; however, a lack of pertinent publicly available information limits its inclusion as part of this assessment. Woodfibre LNG: No potential for cumulative interaction due to distant location from Roberts Bank, and number of vessels in the Strait of Georgia is anticipated to be small compared to overall traffic (EIS Table 8-8); therefore, any cumulative change is not anticipated to be measurable. Burnco Aggregate Project: No potential for cumulative interaction due to distant location from Roberts Bank, and number of vessels in the Strait of Georgia is anticipated to be small compared to overall traffic (EIS Table 8-8); therefore, any cumulative change is not anticipated to be measurable. Rationale for exclusion of these projects is provided in the EIS Appendix 14-A: George Massey Tunnel Replacement Project: No potential for cumulative interaction due to Project location upstream on Fraser River. Pattullo Bridge Replacement Project: Not relevant to VC assessment due to land-based nature of project. Woodfibre LNG: Potential for cumulative interaction with RBT2 as the project will contribute to underwater noise from vessel traffic within the Strait of Georgia; however, the number of vessels is anticipated to be small compared to overall traffic (EIS Table 8-8), and any cumulative change is not anticipated to be measurable. Burnco Aggregate Project: No potential for cumulative interaction due to distant location from Roberts Bank, and number of vessels in the Strait of Georgia is anticipated to be small compared to overall traffic (EIS Table 8-8); therefore, any cumulative change is not anticipated to be measurable. **Addressed in response to IR4-09:**	**EIS** Appendix 13-C Rationale for Inclusion/Exclusion of Other Certain and Reasonably Foreseeable Projects and Activities in the Cumulative Effects Assessment of Marine Fish Appendix 14-A Rationale for Inclusion/Exclusion of Other Certain and Reasonably Foreseeable Projects and Activities in the Cumulative Effects Assessment of Marine Mammals **Information Requests** Response to Sufficiency Information Request #09 (IR4-09 of CEAR Document #1051)

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
				In the VFPA's response to IR4-09, updated project status and vessel movement information is provided as available for the projects listed in the EIS and MSA (north of Segment B), plus other new projects considered to be certain or reasonably foreseeable (as of July 1, 2017). As part of this update, Woodfibre LNG Project vessel projections are updated. However, because the Burnco Aggregate project's activities fall outside the marine shipping area, it is not updated as part of the response.	
TWN-5.16	Stated that the natural landscape and Tsleil-Waututh Nation connection to it is sacred. Stated that the natural landscape (historic ecological conditions) is considered 'baseline' by Tsleil-Waututh Nation and not the current, existing conditions.	20-Nov-2014, Health & Aboriginal Rights Workshop - Tsleil-Waututh Nation	**20-Nov-2014, Workshop:** Noted existing impairment of asserted rights to the access of trails and travel ways in the Project vicinity (BC Ferries terminal, existing Roberts Bank facility). Stated that the VFPA does not expect that the Project is going to result in an additional impact because of its location. Stated that if Tsleil-Waututh Nation would like to share additional information about how the Project might further impact access to trails and travel ways, please advise the VFPA.	**Addressed in response to AIR-12.04.15-13:** In the EIS, the IC and VC sections presenting existing conditions (i.e., baseline) reflect the conditions of the environment as modified by past development. Further discussion of how the VFPA considered the effects of past, present, and future projects is provided in the response to AIR-12.04.15-13, including in that response's schedules focused on applicable VCs.	**Information Requests** Response to Additional Information Request #13 (AIR-12.04.15-13 of CEAR Document #388)
TWN-5.17	Requested that all effects, including those generated by mitigation and adaption measures be included in the cumulative effects assessment. Without this, there is no way of knowing what the possible and real life effects may actually be once the Project starts its lifecycle.	03-Nov-2016, Letter to Panel (CEAR Document #888)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 8.0:** The environmental assessment for the Project was developed to meet the requirements specified in the *EIS Guidelines* and consistent with existing guidance documents, including the *Operational Policy Statement Assessing Cumulative Environmental Effects Under the* Canadian Environmental Assessment Act, 2012, *Determining Whether a Project is Likely to Cause Significant Adverse Environmental Effects*, the *Cumulative Effects Assessment Practitioners' Guide*, and the *Guideline for the Selection of Valued Components and Assessment of Potential Effects*, among others. Where measurable residual effects to a VC have been predicted to result from the Project, a cumulative effects assessment was conducted to determine whether Project-related residual effects are likely to interact cumulatively with the effects of other projects and activities. Similarly, where Project-induced changes to an IC were expected, the potential for those changes to combine cumulatively with changes caused by other projects and activities was assessed. In most cases, the assessment of future cumulative effects was conducted within the boundaries of the RAA identified for the VC. For certain VCs, however, the cumulative effects assessment boundaries differed. In all cases, the rationale supporting the selection of spatial boundaries for the assessment of cumulative effects or changes on a VC or IC is provided in the corresponding section of the EIS. Where the Project was predicted to contribute to incremental cumulative effects, additional mitigation measures were considered. The VFPA then determined the significance and likelihood of any adverse residual cumulative effects following the implementation of mitigation measures. **Addressed in EIS Section 33.5:** Similar to the Adaptive Management Strategy (AMS) for DP3, as described in EIS Section 33.5, the VFPA is committed to developing and implementing a Follow-up	**EIS** 8.0 Effects Assessment Methods 33.5 Follow-Up Program

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
				Program for the Project. The purpose of the Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project.	
TWN-5.18	Stated that the scope and methodology of assessing impacts from Marine Shipping need to include the lifespan of all shipping vessels, from origination to destination and so on. Stated that Tsleil-Waututh Nation expects that all projects in the area, such as those on the Fraser River, up Howe Sound and in the Burrard Inlet be included in the Cumulative effects assessment.	03-Nov-2016, Letter to Panel (CEAR Document #888)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 1.0:** On January 7, 2014, the CEA Agency issued *EIS Guidelines* pursuant to *CEAA, 2012* for RBT2, specifying the nature, scope, and extent of information to be included in the Project's EIS. As set out in the *EIS Guidelines*, part 1, section 3, the scope of the Project for the purposes of the environmental assessment includes the Project components, associated and ancillary works, transportation within the areas for which the proponent has jurisdiction, and other characteristics as necessary to assist in understanding the Project's environmental effects. On April 17, 2015, the CEA Agency issued *Updated EIS Guidelines* that included the addition "environmental effects of marine shipping associated with the Project, beyond the scope of the Project (VFPA jurisdiction) to the 12 nautical mile limit of Canada's territorial sea" (*Updated EIS Guidelines*, section 17). **Addressed in EIS Section 8.1.9:** Pursuant to the *Operational Policy Statement Assessing Cumulative Environmental Effects Under the* Canadian Environmental Assessment Act, 2012 (CEA Agency 2013), a Project and Activity Inclusion List (EIS Table 8-8) was compiled that identifies other certain and reasonably foreseeable projects and activities that will be carried out within the VC and IC spatial boundaries established for the assessment of Project-related cumulative effects. Locations of projects are shown in EIS Figure 8-3. In each IC and VC section, potential effects of the other certain and reasonably foreseeable projects and activities listed in EIS Table 8-8 relevant to the IC or VC are identified, drawing on publicly available information sources such as other environmental assessments and regulatory submissions and proponent websites. The assessment of future cumulative effects included consideration of the potential for an interaction between a potential Project-related residual effect on a VC and the potential effects of other certain and reasonably foreseeable projects and activities on that VC. Each assessment section presents an explanation of the rationale for including or excluding other specific projects and activities from the VC-specific cumulative effects assessment. **Addressed in MSA Section 6.7:** Each assessment in MSA Sections 7.0, 8.0, and 9.0 includes an assessment of potential additional future cumulative interactions between the residual effects anticipated for the VC (or residual changes for an IC), if any, and effects associated with additional marine shipping activity in the marine shipping area in 2030 related to reasonably foreseeable projects and activities. Projected future marine shipping traffic volumes are provided in MSA Table 4-7. These traffic volumes are associated with certain and reasonably foreseeable projects and activities listed in MSA Appendix 6-A (which also provides rationale for exclusion or inclusion in the cumulative effects assessments). The significance determination for any residual cumulative effects is made using the same significance threshold as defined for the assessment of residual effects. Potential interactions with future certain or reasonably foreseeable marine-based projects are limited to increases in vessel traffic associated with those projects. The projects identified in EIS Table 8-8 include those that have been publicly announced and for which information regarding project scope and timing is publicly available. Projects were identified by reviewing publicly available information sources, including the following: • The CEA Agency Registry; • B.C. EAO's online Project Information Centre; • B.C. Major Projects Inventory;	**EIS** 1.0 Introduction 1.1 Purpose of the Environmental Impact Statement 8.0 Environmental Assessment Methods 8.1.9 Cumulative Effects Assessment 8.1.9.1 Identification of Other Certain and Reasonably Foreseeable Projects and Activities **MSA** 6.0 Effects Assessment Approach 6.7 Cumulative Effects Assessment Appendix 6-A Certain and Reasonably Foreseeable Projects and Associated Activities Considered in the Marine Shipping Cumulative Effects Assessment 7.0 Physical Environment 8.0 Marine Biophysical Environment Table 8-8 Project and Activity Inclusion List 9.0 Human Environment ***Updated EIS Guidelines***

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
				• Provincial government websites listing approved and applied-for tenures and licences (e.g., Ministry of Environment Stewardship Division, GeoBC, B.C. Oil and Gas Commission); • The VFPA's Projects and Planning website; • The VFPA's Land Use Plan; • Existing land and resource management plans and land use plans; and • Other publicly available information sources.	
TWN-5.19	Stated that the methodology of the Cumulative effects assessment is lacking in scope; the methodology used to assess human health effects lacks in assessing health effects to Aboriginal groups; and given the lack of a deep and holistic methodology, the methodology used to assess negligible effects is inherently flawed, and thus does not accurately assess effects.	03-Nov-2016, Letter to Panel (CEAR Document #888)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 8.0:** The environmental assessment for the Project was developed to meet the requirements specified in the *EIS Guidelines* and consistent with existing guidance documents, including the *Operational Policy Statement Assessing Cumulative Environmental Effects Under the* Canadian Environmental Assessment Act, 2012, *Determining Whether a Project is Likely to Cause Significant Adverse Environmental Effects*, the *Cumulative Effects Assessment Practitioners' Guide*, and the *Guideline for the Selection of Valued Components and Assessment of Potential Effects*, among others. **Addressed in response to IR-7.31.15-28:** As noted in the VFPA's response to IR-7.31.15-28, the EIS presents an assessment of the effects of the Project on human health in a manner that differentiates between Indigenous and non-Indigenous people. EIS Section 27.0 and EIS Section 32.2 address potential effects of the Project related to human health. Within the human health section, information is presented separately for both Indigenous and non-Indigenous populations, for both existing conditions and for effects of the Project on human health, except where those distinctions are not practical. Table IR28-1 summarises how the relevant EIS sections address differential conditions and effects between the Indigenous and non-Indigenous populations, and provides a rationale for why aspects may be presented together for those instances in which a distinction is not made.	**EIS** 1.1 Purpose of the Environmental Impact Statement 8.0 Effects Assessment Methods **Information Requests** Response to Information Request #28 (IR-7.31.15-28 of CEAR Document #314) ***Updated EIS Guidelines***
TWN-5.20	Requested that inclusive methodology measures are utilised in relation to the EIS, MSA, and the Project as a whole, such as a methodology that incorporates the use of both qualitative and quantitative methods for all baseline reports.	03-Nov-2016, Letter to Panel (CEAR Document #888)	The VFPA has reviewed this letter and provides the following additional information.	**Addressed in EIS Section 8.1.4:** Descriptions of existing conditions relevant to each IC and VC were developed based on a review of available information and the results of baseline studies (e.g., desktop reviews, field studies, data analyses, modelling) undertaken during Project planning. The studies included collection of quantitative and qualitative data. Each effects assessment section includes information on data quality and reliability with respect to these studies, and any uncertainty or gaps in knowledge associated with the existing conditions of each VC. The influences of natural and human-caused trends that may alter conditions over time, irrespective of changes that may be caused by the Project or other projects and activities, are described with respect to specific ICs and VCs, where relevant. Some Technical Data Reports are appendices to EIS sections, while others are available publicly on the RBT2 website: http://www.robertsbankterminal2.com/environmental-assessment/technical-data-reports/ **Addressed in response to IR-7.31.15-08:** The VFPA's response to IR-7.31.15-08 presents a table that describes how ITK was considered in the development of the EIS.	**EIS** 8.0 Effects Assessment Methods 8.1.4 Description of Existing Conditions **Information Requests** Response to Information Request #8 (IR-7.31.15-08 of CEAR Document #314) **RBT2 website** http://www.robertsbankterminal2.com/environmental-assessment/technical-data-reports/

Table 6: Effects of the Environment on the Project

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-6.1	Disagreed that there will be no negligible effects related to noise, air quality and edible marine resources, including the consumption of edible marine resources, water quality, traditional land use and climate change. Requested negligible effects to be re-calculated upon implementation of all other concerns.	03-Nov-2016, Letter to Panel (CEAR Document #888)	The VFPA has reviewed this letter and provides the following additional information.	**Additional information provided by the VFPA:** As a result of extensive studies and assessment, the VFPA is confident potential adverse effects can be fully or partially avoided or reduced through Project design and the implementation of environmental management programs. Where Project-related effects cannot be fully avoided or reduced, offsetting measures, such as the creation and enhancement of habitat, will be applied. Similar to the AMS for DP3, as described in EIS Section 33.5, the VFPA is committed to developing and implementing a Follow-up Program for the Project. The purpose of the Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project. To ensure the program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the EIS. The Follow-up Program will include: • An evaluation of the adequacy of existing data to provide a benchmark against which to test Project-related effects; • A monitoring design drawing on the measurable parameters identified to be field-tested; • A methodological approach for using field-collected data to measure and verify the accuracy of the effects predicted in the EIS; • A reporting framework that defines frequency of reporting, distribution, and feedback mechanisms; and • Details of the VFPA's approach to adaptive management for the Project through construction and operation. The Follow-up Program will be developed in consultation with federal agencies, including the CEA Agency, Fisheries and Oceans Canada (DFO), and ECCC. Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on the program and approving agencies have an opportunity to evaluate and approve the program. Feedback from Indigenous groups regarding the draft program will be sought through the VFPA's ongoing engagement initiatives.	**EIS** 33.5 Follow-Up Program

Table 7: Engagement and Consultation

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-7.1	Requested Technical Advisory Group (TAG) reports. Asked whether field studies were discussed with the TAG, and why only four topics were addressed. Asked whether the TAG reports will list all scientists involved. Stated that Tsleil-Waututh was excluded from participating in the TAG.	22-Oct-2013, Meeting 15-Jun-2015, Letter to the CEA Agency (CEAR Document #249)	**22-Oct-2013, Meeting:** Stated that a TAG was used for subjects with limited information and questions around the perception of what the issues and concerns were. It was an opportunity to have experts around the table discussing and providing guidance on how to move forward. Provided an example of productive capacity where the guidelines from regulators are not available. Noted that scientists around the TAG table helped to come up with methodology when uncertainty existed. **27-Nov-2013, Letter from the VFPA:** TAG reports were provided to Tsleil-Waututh along with the other Indigenous groups. This includes: • Productive Capacity; • Southern Resident Killer Whales; • Geomorphology; and • Shorebirds and Biofilm. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses **13-Oct-2015, Letter from the CEA Agency (CEAR Document #313):** *"The Agency did not request additional information for this item since the TAG process is a proponent run process and not a requirement of the EIS Guidelines. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	**Addressed in EIS Appendix 7.2-B (#23):** The VFPA established the TAG process in 2012 to engage and consult with leaders in the technical and scientific community to provide guidance on four key topic areas: southern resident killer whales, biofilm and shorebirds, coastal geomorphology, and productive capacity. The TAG terms of reference and summary reports are available on the Project website: http://www.robertsbankterminal2.com/information-centre/project-documents/. The following Indigenous groups were invited to contribute to the TAG process: • Tsawwassen First Nation; • Musqueam First Nation; • Semiahmoo First Nation • Tsleil-Waututh Nation; • Stó:lō Nation; and • Stó:lō Tribal Council The TAG process was also discussed in meetings with Indigenous groups, and summary reports on the TAG process were provided to all Indigenous groups for review and comment. **Additional information provided by the VFPA:** The VFPA sent Tsleil-Waututh Nation a letter on 31-Oct-2012, informing Tsleil-Waututh Nation about the TAG process and providing information on upcoming sessions. The letter enclosed an information sheet about the TAG process for RBT2, noting the 4 key topics to be examined, the objectives and key features of the TAG process, as well as information for potential TAG members (criteria, time requirements). In this letter, the VFPA acknowledged that given the subject matter, Tsleil-Waututh Nation may be interested in participating. The VFPA stated that they would follow-up to discuss how Tsleil-Waututh Nation may want to participate. On 12-Jul-2013, the VFPA followed up by letter providing an update on the TAG process and stating that the VFPA would like to share the TAG summaries with Tsleil-Waututh Nation.	**EIS** 7.0 Engagement and Consultation 7.4 Technical Advisory Group Process (2012 to 2013) Appendix 7.2-A Consultation Activities by Aboriginal Group Appendix 7.2-B Aboriginal Issues and Interests
TWN-7.2	Stated that the VFPA has not included nor addressed all of Tsleil-Waututh's comments in Appendix 7.2-B, specifically letters from Tsleil-Waututh dated 14-Aug-2014 and 15-Jan-2015. Stated that although Tsleil-Waututh finally received a response to these two letters in a letter dated 25-March-2015 from the VFPA, Tsleil-Waututh Nation does not feel that all comments have been addressed. Tsleil-Waututh Nation expects to see these letters and comments in the Appendix 7.2-B.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #249)	**13-Oct-2015, Letter from the CEA Agency (CEAR Document #313):** *"The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	**Additional response provided by the VFPA:** Tsleil-Waututh Nation's letter of 14-Aug-2014 provided comments to the VFPA on the draft community profile, which the VFPA provided to Tsleil-Waututh Nation on 14-Jul-2014. All requested changes to the draft were made with the exception of Tsleil-Waututh Nation's request not to reference the Tsleil-Waututh Nation Statement of Intent (SOI) boundary. This matter was addressed in EIS Appendix 7.2-B (#181). See excerpt below: The *EIS Guidelines* specifically require "a map of [Tsleil-Waututh Nation]'s asserted traditional territory." Unless it is withdrawn, the SOI is by definition [Tsleil-Waututh Nation]'s asserted traditional territory, therefore is required to be included in the EIS. Both the SOI and Consultation Area were shown on Figure 3-3 and 32-4 in the EIS. Tsleil-Waututh Nation's letter of 15-Jan-2015 provided comments to the VFPA on the following two draft EIS sections:	**EIS** Appendix 7.2-B Aboriginal Issues and Interests

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
				• Section 32.0: Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current Use of Lands and Resources for Traditional Purposes (with EIS Figure 32-4 - accompanying map); and • Section 21.1.1: Aboriginal Commercial Fishing and Seafood Harvesting. The VFPA provided these draft sections to Tsleil-Waututh Nation on 09-Dec-2014 for Tsleil-Waututh Nation's review and comment. The VFPA responded to Tsleil-Waututh Nation's letter on 25-Mar-2015, which included a table responding to each comment Tsleil-Waututh Nation provided on these draft sections.	
TWN-7.3	Concerned with lack of meeting notes from 2014 workshops. Stated that Tsleil-Waututh received little to no information from the VFPA regarding responses to our comments and questions during both Aboriginal groups VC workshops (June 6 and July 3, 2014) and the Fall 2014 workshops (October 7, 8, 28 and 29) and the November 20, 2014 meeting regarding the Project. Requested full meeting notes for all of these sessions, but were only provided Aboriginal groups' questions or comments. Stated that no responses from the VFPA, whether from the workshops or as a follow-up answer, were provided. Stated that although the meetings were audio recorded, we still have not seen the full meeting record from these sessions. Stated that in our letter dated January 15, 2015 to the VFPA, we indicated that we require the full meeting records and a revised final draft of the EIS sections with Tsleil-Waututh content to effectively review and provide input. We did not receive either of these documents from the VFPA. Stated that in reference to Appendix 7.2-B ID 15, we do not agree that these sessions should be weighted as a meaningful part of the consultation process but rather have been a one-sided information sharing session.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #249)	**13-Oct-2015, Letter from the CEA Agency (CEAR Document #313):** *"This item is with respect to consultation between [the VFPA] and Tsleil-Waututh Nation. The Panel will determine whether it requires additional information or clarification with respect to Tsleil-Waututh Nation's input to [the VFPA] to inform its sufficiency review."* **14-Oct-2014, Email from the VFPA:** Attached draft notes from the 07-Oct-2014 and 08-Oct-2014 workshops, which summarised the comments and questions raised by participants as noted by the VFPA at last week's workshops. Asked for comments and feedback on documents. Provided draft comments and questions from Workshop 1 and 2. **03-Nov-2014, Email to Tsleil-Waututh Nation:** Attached two draft documents for Tsleil-Waututh Nation's review. Each document is a draft table of the comments and questions raised by participants as noted by the VFPA at last week's workshops. Provided draft comments and questions from Workshop 3 and 4. **14-Nov-2014, Email to Tsleil-Waututh Nation:** The VFPA will be providing Tsleil-Waututh Nation with the full meeting record for Aboriginal Workshops 1-4. We are currently in the process of ensuring we have accurately captured the questions, comments and responses from these sessions. As you have noted below, there can be inaccuracies with the transcription of comments and questions, which is why the VFPA has requested feedback directly from Tsleil-Waututh Nation and others (Indigenous groups, presenters, and other attendees who spoke) with respect to the accuracy of what we have transcribed prior to issuing the entire record. Please note that in addition to the information captured in the meeting record, the EIS will		

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
			contain Tsleil-Waututh Nation's questions and full responses. **18-Nov-2014, Mail to Tsleil-Waututh Nation:** Provided Tsleil-Waututh Nation with a USB with the meeting notes. **30-Nov-2014, Email to Tsleil-Waututh Nation:** Please find attached a summary of Tsleil-Waututh Nation's comments and questions from our recent RBT2 workshop (20-Nov-2014 workshop)… We are seeking your input or direction on what is contained and request you make changes to any of the content that is either inaccurate or inappropriate for inclusion. **19-Apr-2016, Letter from the VFPA:** A package of meeting records, including those from the Fall of 2014, was sent to Tsleil-Waututh Nation.		
TWN-7.4	Requested to be included alongside the already-listed Aboriginal Groups in the assessment of potential effects on the current use of lands and resources for traditional purposes, and potential impacts to the exercise of asserted or established Aboriginal and treaty rights that may results from marine shipping associated with the Project.	18-Dec-2015, Letter to the CEA Agency (CEAR Document #379)	**12-May-2016, Letter from the CEA Agency (CEAR Document #399):** *"Thank you for your comment. The Agency directed Vancouver Fraser Port Authority (then Port Metro Vancouver) to consult with Tsleil-Waututh on the effects of the Project on January 13, 2016."*	**Additional response provided by the VFPA:** On 04-Oct-2016, the VFPA submitted the supplementary information related to the additional study and engagement that was undertaken regarding the MSA, per the CEA Agency's letter from January 13, 2016. This additional information summarises potential impacts of marine shipping associated with the Project as it relates to the exercise of potential or established Aboriginal or treaty rights of: • Musqueam First Nation; and • Tsleil-Waututh Nation.	
TWN-7.5	Notified the Panel that they are unable to provide comments by the requested deadline of November 15, 2017. Requested for an extension to February 28, 2018, unless otherwise notified due to unforeseen circumstances. Requested that their next submission be received, reviewed and incorporated by the panel prior to declaring sufficiency. Otherwise, Tsleil-Waututh Nation should be notified accordingly; this notification would need to include a discussion between the Panel and Tsleil-Waututh Nation to ensure enough time is provided for Tsleil-Waututh Nation to provide study outcomes and information that has not yet been provided; further information may provide new information to the Panel, as required during the sufficiency stage.	17-Nov-2017, Letter to Panel (CEAR Document #1103)	The VFPA understands that this comment is directed to the Panel. The VFPA has reviewed this letter and has no additional information to provide.		

Table 8: Environmental Assessment and Permitting Process

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-8.1	Asked whether the old *Fisheries Act* will be used for RBT2.	22-Oct-2013, Meeting	**22-Oct-2013, Meeting:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS.	**Addressed in EIS Table 35-2:** As noted in EIS Table 35-2, the VFPA will ensure that the design, construction, and operation of the Project is carried out in an environmentally responsible manner, and will employ standard management practices and comply with current federal, provincial, and municipal statutes, where applicable. The VFPA will ensure that required statutory permits, approvals, and authorisations are in place prior to the commencement of the activity or activities to which they pertain.	**EIS** 35.0 Effects Assessment Summaries Table 35-2 Proposed Mitigation Measures and Commitments
TWN-8.2	Interested in the role of the Province of B.C. with respect to the Project.	09-May-2014, Meeting	**09-May-2014, Meeting:** Committed to sharing with Indigenous groups what the Province of B.C. announces with respect to the Project and associated environmental assessment process. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses	**Addressed in EIS Appendix 7.2-B (#8):** On November 5, 2014, the B.C. EAO stated the Project is reviewable under Part 8 of the Reviewable Projects Regulation, B.C. *Environmental Assessment Act*. On December 19, 2014, the B.C. Minister of Environment issued an order under s. 14 of the Act establishing the Province's procedures and methods for conducting the environmental assessment for the Project. The Minister ordered that the scope of the Project is as defined by the CEA Agency in the *EIS Guidelines*; the scope of the assessment must include factors established by the federal Minister as well as potential adverse environmental, economic, social, heritage, and health effects, including cumulative effects, and practicable means to mitigate such potential adverse environmental effects, and potential adverse effects on Indigenous groups; the B.C. EAO will principally rely on the environmental assessment to be conducted by the federal review panel and on consultation conducted by the CEA Agency with Indigenous groups, whose interests are potentially affected by the Project; and, the B.C. EAO must make a recommendation to the Minister within 30 days of receiving notice of the decision from the federal Minister. The information presented in the EIS is intended to satisfy both federal and provincial environmental assessment requirements. More information regarding the federal environmental assessment for the Project can be found on the CEA Agency website at www.ceaa-acee.gc.ca, Reference Number: 80054. More information regarding the provincial environmental assessment for the Project can be found on the B.C. EAO's Project Information Centre (e-PIC) website at http://a100.gov.bc.ca/appsdata/epic/html/deploy/epic_project_home_410.html	**EIS** 6.0 Environmental Assessment and Permitting Process 6.2 Provincial Involvement and Process Appendix 7.2-B Aboriginal Issues and Interests
TWN-8.3	Asked if the CEA Agency grants approvals with conditions, and if First Nations will have an opportunity to comment on these conditions.	06-Jun-2014, Valued Components Workshop #1	**06-Jun-2014, Workshop:** Stated that the Review Panel can recommend conditions in its report. Stated that comments can be provided to the Review Panel during the Review Phase.	**Additional information provided by the VFPA:** The *Updated EIS Guidelines* as issued by the CEA Agency directs the proponent (the VFPA) to provide sufficient data and analysis on any potential changes to the environment to permit a thorough evaluation of the environmental effects of the project by a Review Panel. The Review Panel is currently undertaking an assessment of the environmental effects of the project in a manner consistent with the requirements of *CEAA, 2012* and the Final Terms of Reference (CEAR Document #176). The Review Panel will prepare and submit a report to the federal environment Minister, who will in turn make a determination of the significance of potential environmental effects, potential impacts to Aboriginal treaty rights and decide whether the project should proceed. The Review Panel will prepare and submit a report to the federal environment Minister, who will in turn make a determination of the significance of potential environmental effects. If the Minister decides that the Project is likely to cause significant adverse environmental effects, the Minister must refer to the Governor-in-Council the matter of whether those effects are justified in the circumstances and the decision of whether the Project should be approved. Since the beginning of the environmental assessment process for RBT2, Indigenous groups have, and will continue to have opportunities to participate in, review, and comment on the potential effects of the Project, with records of comments being hosted publicly on the CEA Agency Registry. In addition, the Review Panel's report will contain the Review Panel's recommended conditions for the Project. The Crown will consult on the Review Panel's report, including those conditions, prior to the Minister or Governor-in-Council making a determination with respect to the Project.	***Updated EIS Guidelines*** ***FINAL Roberts Bank Terminal 2 Project Review Panel Terms of Reference (CEAR Document #176)***
TWN-8.4	Asked whether the VFPA would have to go through another	06-Jun-2014, Valued	**06-Jun-2014, Workshop:** Stated that the regulators determine what it is that needs to be assessed.	**Addressed in EIS Appendix 7.2-B (#6):** There are no plans to modify the Project to handle bulk oil or coal. It is likely that if oil was considered for transport at Roberts Bank, further assessment would be required by regulators.	**EIS** 4.0 Project Description

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
	assessment if oil was considered for transport.	Components Workshop #1	Stated that the *EIS Guidelines* specify exactly what this process is according to the project description, so if that were to change they would have to re-assess. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.		Appendix 7.2-B Aboriginal Issues and Interests 9.2 Air Quality 27.0 Human Health
TWN-8.5	Concerned with the limited amount of time allowed for the EIS review.	20-Nov-2014, Health & Aboriginal Rights Workshop - Tsleil-Waututh Nation	**20-Nov-2014, Workshop:** Stated that the CEA Agency determines the time allotted for review. Stated that there will be approximately a total of five months for the CEA Agency to carry out their completeness review. Stated that in developing its requests, the CEA Agency will ask if information has been captured correctly, and Tsleil-Waututh Nation will have the opportunity to let the CEA Agency know if mistakes were made. Stated that outside of that process, the VFPA is willing to come and discuss any aspect of the document. **06-May-2015, EIS Orientation Workshop:** The VFPA hosted a session to provide an overview of and an orientation to the EIS and to provide an opportunity for questions about the structure and organisation of the EIS. Representatives from Tsleil-Waututh Nation were in attendance. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses	**Addressed in EIS Appendix 7.2-B (#18):** Since January 2011, the VFPA has consulted with Indigenous groups regarding Project planning, components, and activities, selection of VCs, the potential effects of the Project, proposed mitigation measures, and potential changes to the environment related to the Project. Indigenous groups were also provided draft community profiles and rights and Current Use information for their review and comments. Feedback received was incorporated into the EIS. The VFPA also held technical workshops with Indigenous groups at which the VFPA and technical specialists engaged directly with members of Indigenous groups, discussing specific areas of Indigenous interest and reviewing related technical topics. Participation funding agreements have been negotiated between the VFPA and Indigenous groups, either individually or through associations representing the Indigenous groups, and were designed to support the consultation process for the Project. Additional agreements were reached to support Indigenous groups in the collection of Current Use information and ITK to inform Project planning, effects assessment, and identification of proposed mitigation measures. Throughout the consultation process, the VFPA has provided Indigenous groups with reasonable opportunities to present and communicate their interests and issues in relation to the Project to both the VFPA and relevant regulatory agencies. **Additional information provided by the VFPA:** The EIS was submitted to the CEA Agency in March 2015. Indigenous groups have had, and will continue to have opportunities to participate in, review, and comment on the potential effects of the Project, with records of comments being hosted publicly on the CEA Agency Registry. Additional opportunities for participation will be available at the Review Panel Hearings.	**EIS** 7.0 Engagement and Consultation 7.2 Aboriginal Engagement and Consultation 7.2.2 Pre-EIS Submission Consultation Process 7.2.3 Future Planned Engagement and Consultation Appendix 7.2-A Consultation Activities by Aboriginal Group Appendix 7.2-B Aboriginal Issues and Interests
TWN-8.6	Asked about the CEA Agency's process, the panel process and timing.	15-Dec-2015, Meeting	**15-Dec-2015, Meeting:** Stated that questions regarding the process can be directed to the CEA Agency.	**Additional information provided by the VFPA:** More information regarding the federal environmental assessment for the Project can be found on the CEA Agency website at www.ceaa-acee.gc.ca, Reference Number: 80054.	**http://www.ceaa-acee.gc.ca/050/evaluations/document/exploration/80054?**
TWN-8.7	Interested in pushing Environmental Assessment to the next level, and in thinking	03-Aug-2016, Issues Workshop - Tsleil-Waututh	**03-Aug-2016, Workshop:** Stated that the VFPA funded a study with the Pacific Salmon Foundation in collaboration with Tsawwassen First	**Addressed in EIS Sections 8.0 and 34.2:** The CEA Agency administers federal environmental assessments in accordance with *CEAA, 2012* as legislated by parliament. As stated in EIS Section 8.0, the methods for the environmental assessment	**EIS** 8.0 Effects Assessment Methods 34.2 Benefits of the Project

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
	creatively and outside the box. Asked how this Environmental Assessment process could be used to address previous and current development on eulachon. Interested in ways for this work to inform other related projects down the road.	Nation, Métis Nation British Columbia, and Semiahmoo First Nation	Nation that looked at eulachon habitat use in the Fraser River. It examined the feasibility of using PIT tags to track eulachon. It was noted the study of Fraser eulachon is an emerging science, and efforts are being made to get it on the radar.	were developed to meet the requirements specified in the *EIS Guidelines* and are consistent with existing guidance documents and *CEAA, 2012*. However, through the extensive study programs undertake during preparation of this EIS, the VPFA has advanced understanding of environmental and socio-economic aspects in the vicinity of the Project. In particular, several important scientific advances were made by the VFPA in its study of the proposed Project (see EIS Table 34-8). These innovations in data collection, modelling, and analysis will benefit the scientific community, resource managers, and any future assessments within the region. As a result of this work, sustainable development and stewardship opportunities in the area have been enhanced. **Additional information provided by the VFPA:** The federal government is considering changes to the environmental and regulatory system. Further information can be found at: https://www.canada.ca/en/services/environment/conservation/assessments/environmental-reviews.html	

Table 9: Environmental Management Program

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-9.1	Noted that environmental assessments enter into a very hypothetical world and Tsleil-Waututh Nation needs to be confident that the predicted effects are solid.	03-Aug-2016, Issues Workshop - Tsleil-Waututh Nation, Métis Nation British Columbia, and Semiahmoo First Nation	**03-Aug-2016, Workshop:** Recorded comment for consideration by the Project team. **30-Aug-2017, Meeting:** The VFPA hosted a Follow-up Program Workshop, and representatives from Tsleil-Waututh Nation attended. The VFPA discussed the Follow-up Program and lessons learned from DP3. The VFPA sought feedback from Tsleil-Waututh Nation on the Follow-up Program and asked what Tsleil-Waututh Nation felt should be considered, what they felt was important to their community and how they would like to be involved going forward.	**Additional information provided by the VFPA:** As a result of extensive studies and assessment, the VFPA is confident potential adverse effects can be fully or partially avoided or reduced through Project design and the implementation of environmental management programs. Where Project-related effects cannot be fully avoided or reduced, offsetting measures, such as the creation and enhancement of habitat, will be applied. A robust monitoring and follow-up program will be implemented to assess the effectiveness of mitigation measures. **Addressed in EIS Section 33.5:** The purpose of the Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project. To ensure the Program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the environmental impact statement. The Follow-Up Program will include: • An evaluation of the adequacy of existing data to provide a benchmark against which to test Project-related effects; • A monitoring design drawing on the measurable parameters identified to be field-tested; • A methodological approach for using field-collected data to measure and verify the accuracy of the effects predicted in the EIS; • A reporting framework that defines frequency of reporting, distribution, and feedback mechanisms; and • Details of the VFPA's approach to adaptive management for the Project through construction and operation. The Follow-up Program will be developed in consultation with federal agencies, including the CEA Agency, DFO, and ECCC. Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on the program and approving agencies have an opportunity to evaluate and approve the program. Feedback from Indigenous groups regarding the draft program will be sought through VFPA's ongoing engagement initiatives. **Addressed in EIS Appendix 7.2-B (#32):** An adaptive management approach will be taken as indicated in EIS Section 33.5. The VFPA is committed to developing and implementing a Follow-up Program for the Project. The purpose of the Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 33.0 Environmental Management Program 33.5 Roberts Bank Terminal 2 Follow-up Program

Table 10: Human Health – Valued Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-10.1	Asked if access to traditional foods is addressed in the assessment, and how it links to food insecurity. Asked if food surveys were conducted with local First Nations to identify either quantitative or qualitative information. Stated that the Swinomish communities in Washington have carried out consumption rate studies and the results could apply to all Coast Salish Nations.	20-Nov-2014, Health & Aboriginal Rights Workshop - Tsleil-Waututh Nation	**20-Nov-2014, Workshop:** Responded that in general traditional food is more nutritious, and when people do not have access to traditional food, that is a factor that contributes to food insecurity. Stated that the VFPA drew upon information where it was available. Stated that based on consultation, the VFPA was able to assess how that would translate to food insecurity in the study area. Stated that the VFPA did not conduct a separate study on traditional food consumption; the results came from information obtained through other studies. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 27.0 on Human Health.	**Addressed in EIS Section 27.0:** Information about traditional food consumption was gathered through existing literature as well as engagement activities (summarised in EIS Section 7.0). The human health assessment considered the subsistence food consumption of individual Indigenous groups, as summarised in EIS Section 32.2. This information was included in the evaluation of potential effects on food security, as well as health inequity. Note the VFPA issued a revised version of EIS Section 27.0 and EIS Appendix 27-B (see CEAR Document #412).	**EIS** 7.0 Engagement and Consultation 7.2 Aboriginal Groups Engagement and Consultation 27.0 Human Health 27.4 Information Sources 27.5.7 Food Security 27.6 Future Conditions with the Project – Potential Project-related Effects 32.2 Current Use of Land and Resources for Traditional Purposes
TWN-10.2	Concerned about the safety of bivalve and crab resources at Roberts Bank and asked whether this is considered in the assessment.	20-Nov-2014, Health & Aboriginal Rights Workshop - Tsleil-Waututh Nation	**20-Nov-2014, Workshop:** Stated that the safety of bivalve and crab resources at Roberts Bank was addressed in the human health risk assessment (HHRA), but not sure about the marine invertebrates VC assessment. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **09-Jul-2015, Letter from the VFPA:** Attached a letter and memorandum regarding the studies undertaken by Hemmera in response to reports from Indigenous groups to the VFPA regarding blackening of Dungeness crab and concerns related to potential contamination. The memo provided the conclusions of the study: • There is no evidence of coal contamination, based on the results of sensitive tissue chemistry analysis testing for polycyclic aromatic hydrocarbons (PAHs), metals, and trace elements; • Consumption risks are acceptably low and pose no risk to human health; and • The underlying cause of the blackened shells is determined to be shell disease (a common condition due to bacterial infection of existing lesions/damage in the crab shells). **12-Apr-2018, Letter from the VFPA:**	**Addressed in EIS Appendix 7.2-B (#74):** Potential Project-related effects on Dungeness crabs are described in the EIS. An Edible Shellfish Study was undertaken to quantify bivalve shellfish and Dungeness crab soft tissue contaminant concentrations. The results of this study are provided in the EIS in the marine invertebrates and human health sections. In late 2014, samples of crab were collected by Indigenous crab harvesters concerned about contamination, and the VFPA was submitted for tissue testing for various substances of concern, including PAHs, metals, and fungus. Preliminary observational results indicate that the causes of black colouration of crabs is consistent with shell disease, and not likely related to contamination from coal dust (EIS Appendix 27-C, Section 4.76). **Addressed in responses to IR4-33 and IR4-34:** Further information concerning the VFPA's investigations into 'blackened' crabs is provided in the VFPA's response to IR4-34. In summary, black lesions were observed on four of the five crabs collected by Indigenous harvesters. The black lesions were concluded to be consistent with chitinolytic shell disease, generically referred to as 'shell disease', a condition common to crab and other crustaceans. This disease is caused by a bacterial or fungal infection of an area where the outer layer of the shell has been previously damaged. Shell disease has not been linked to contamination. The disease is not specific to the Roberts Bank area and is present across the Pacific Northwest, including Alaska and B.C., and in Atlantic Canada. In its response to IR4-33, the VFPA provided results of the study. In summary: A crab hepatopancreas study was conducted at Roberts Bank to determine the concentrations of contaminants of concern in crab hepatopancreas in the LAA. In June 2017, Dungeness crab were collected from five traps placed at each of the three study locations (15 traps total). Twelve adult male crabs were harvested from each of the three sites (36 crab total). Samples were submitted under chain of custody to analytical laboratories	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 12.0 Marine Invertebrates 12.4.1 Desktop and Field Studies Table 12-4 Marine Invertebrates Studies to Support the Assessment 12.5 Existing Conditions 12.5.3 Dungeness Crabs 12.6 Future Conditions with the Project 12.6.2 Negligible Effects 27.0 Human Health 27.6.4 Potential Effect # 3 – Adverse Health Effects due to Stress and Annoyance - Perceived Contamination Appendix 27-C Shellfish Harvesting Potential and Contaminant-related Consumption Risks at Roberts Bank **Information Requests** Response to Sufficiency Information Request #33 (IR4-33 of CEAR Document #1078) Response to Sufficiency Information Request #34 (IR4-34 of CEAR Document #946)

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
			Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the following documents review: • IR4-33 - Crab Hepatopancreas Additional Study Summary; and • IR4-34 - Black Crab Additional Studies Summary. Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.	accredited by the Canadian Association for Laboratory Accreditation (CALA) for the analysis requested. The analysis was completed in August 2017. Collectively, the results of a statistical comparison across sites indicate that the average concentrations of polychlorinated biphenyls (PCBs), coal indicator elements, arsenic compounds, and PAHs measured in hepatopancreas from crab collected from the RBT2 and ITP sites are not statistically higher than those measured in crab from the Canoe Passage reference site. This suggests that existing sediment and water quality in and around the existing terminal and proposed RBT2 terminal are not contributing to contaminant concentrations in crab hepatopancreas that are higher than levels found in crab hepatopancreas from the Canoe Passage reference site.	
TWN-10.3	Asked whether health effects from exposure to contaminants in shellfish modelled were based on consumption rates for European Canadians, or Coast Salish people.	20-Nov-2014, Health & Aboriginal Rights Workshop - Tsleil-Waututh Nation	**20-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#137):** The consumption rates assumed for bivalves and crabs were based on the available information on west coast Indigenous diets; for example, as documented in the First Nations Food, Nutrition, and Environment Study (referenced in the human health assessment). The HHRA related to potential shellfish contamination assumes much higher routine and upper range consumption rates than typical for European Canadians.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 27.0 Human Health 27.5.4 Exposure to Shellfish Contamination Appendix 27-C Shellfish Harvesting Potential and Contaminant-related Consumption Risks at Roberts Bank
TWN-10.4	Asked what the baseline for assessing contaminated shellfish is (i.e., pre- or post-sanitary closure). Asked if contamination for edible marine resources is not looked at as part of the EA baseline conditions.	20-Nov-2014, Health & Aboriginal Rights Workshop – Tsleil-Waututh Nation 27-Jun-2016, Email	**20-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **07-Jul-2016, Email from the VFPA:** Response to Tsleil-Waututh Nation's question regarding edible marine resources is as follows: Contamination of edible marine resources was looked at in the MSA, in the context of potential contamination from routine marine vessel traffic, as well as an accidental fuel spill (MSA Sections 9.1.4.3 and 10.5.9.4, respectively). Information related to the reliance by Indigenous groups on edible marine resources in the marine shipping LAA is included in MSA Section 9.5, and also in our response to the AIR-12.04.15-31, which includes a summary of available information by Indigenous group. As indicated in the existing conditions summary you recently reviewed, no additional information on Tsleil-	**Addressed in EIS Appendix 7.2-B (#135):** Commercial and recreational crab harvesting closures associated with the Roberts Bank terminals are considered in EIS Section 21.0 and EIS Section 24.0. DFO bivalve harvesting closures related to proximity to sanitary outfalls are considered in EIS Appendix 27-C. An assessment of current shellfish harvesting potential and contaminant-related consumption risks is provided in EIS Section 27.0 and EIS Appendix 27-C. The VFPA conducted two studies of levels of potential contaminants of concern (related to the Project) in edible shellfish tissue in 2014. A field study was conducted in early 2014, including sampling and lab analysis of bivalve shellfish and crabs. External examination of both external and internal surfaces of Dungeness crab did not yield any indication of coal particulate accumulation. However, twelve crabs did have external black spots on their shell, indicative of shell disease that is routinely observed in Dungeness crabs following cuticle damage as a result of fights with other crabs or other species. The VFPA also has been working with Indigenous groups to collect additional crab samples to investigate the presence and composition of the black material reported by Indigenous crab harvesters at Roberts Bank. In late 2014, samples of crab were collected by Indigenous crab harvesters concerned about contamination, and the VFPA has submitted these for tissue testing for various substances of concern, including PAHs (related to coal), metals, and fungus. **Addressed in AIMSA Appendix 2-B (#16):**	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 21.0 Marine Commercial Use 24.0 Outdoor Recreation 27.0 Human Health 27.5.4 Exposure to Shellfish Contamination Appendix 27-C Shellfish Harvesting Potential and Contaminant- Related Consumption Risks at Roberts Bank Technical Report **AIMSA; CEAR Document #572** Appendix 2-B Aboriginal Issues and Interests 3.0 Human Health 3.1.2.4 Contamination in Edible Marine Resources

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
			Waututh Nation's country food reliance specific to the marine shipping area was available from the sources we reviewed. If you have any additional information you would like to be included in this submission, please provide it and we will ensure it is included.	Contamination for edible marine resources in the Roberts Bank area were included in the existing conditions section of the human health assessment in the EIS. Contamination for edible marine resources in the marine shipping area was considered in the existing conditions section of the human health assessment in the MSA and the AIMSA.	
TWN-10.5	Asked how mitigation for health inequity will be determined to be successful.	20-Nov-2014, Health & Aboriginal Rights Workshop - Tsleil-Waututh Nation	**20-Nov-2014, Workshop:** Stated that the VFPA could only obtain qualitative information, and make predictions on a population level, such as asking whether or not the effects would be evenly distributed. Stated that the HHRA looks at both the Indigenous population as well as the general population, but for the most part results are at the general population level. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses as well as Section 27.0 on Human Health.	**Addressed in EIS Appendix 7.2-B (#130):** As discussed throughout EIS Section 27.0, the Project is expected to result in both positive effects (such as economic benefits) and adverse health effects (such as potential effects on cultural activities such as subsistence food harvesting), and the distribution of these effects may vary across population groups. This raises the concept of health inequity: the extent to which the distribution of positive and adverse health effects is fair and equitable. Concerns related to health inequity are addressed in the human health effects assessment; however, the assessment of potential effects on health inequity does not rank the relative importance of the various determinants of health (e.g., purchasing power and cultural activities). Cultural aspects related to subsistence gathering are considered in EIS Section 32.2. **Addressed in response to IR13-15:** The VFPA's forthcoming response to IR13-15 will further discuss the assessment of health inequity within the human health assessment.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 27.0 Human Health 27.6.5 Potential Effect #4 – Adverse Health Outcomes due to Changes in Health Inequity 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes **Information Requests** Response to **Sufficiency Information Request#15 (IR13-15)**
TWN-10.6	Concerned that human health is restricted to biophysical health elements in the EIS, and does not include cultural health or an aboriginal perspective of health, such as the attachment to land. Requested that health to be assessed from a holistic view that includes overall health, cultural health and vibrancy. Stated that the human health assessment focuses on biophysical determinants of health and does not include a cultural health assessment for Aboriginal groups. Stated that cultural health is not limited to harvesting traditional foods but also the connection to cultural heritage (sometimes intangible) and other sacred places. Stated that they have provided the VFPA on 15-Dec-2015 with a recognized and published methodology for conducting Aboriginal cultural health studies and would like to collaboratively pursue the necessary	20-Nov-2014, Health & Aboriginal Rights Workshop – Tsleil-Waututh Nation 15-Jun-2015, Letter to the CEA Agency (CEAR Document #249) 15-Dec-2015, Meeting 18-Dec-2015, Letter to the CEA Agency (CEAR Document #379) 03-Nov-2016, Letter to Panel (CEAR Document #888)	**20-Nov-2014, Workshop:** Stated that in the absence of physical attributes associated with the sites that could be avoided, the VFPA is unsure how to address the sites other than to say there is potential for impact, and to continue to pursue opportunities to discuss this further with Tsleil-Waututh Nation. Stated that in terms of impacts to health, the information presented today makes up the main areas of focus. Stated that the HHRA and the socio-economic areas of study are considered a comprehensive approach. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **13-Oct-2015, Letter from the CEA Agency (CEAR Document #313):** *"The Agency has requested additional information on this item in its letter of July 31, 2015 to [the VFPA] (page 13, IR #29). Tsleil-Waututh is encouraged to bring up concerns in this regard to the Panel once appointed."*	**Addressed in EIS Appendix 7.2-B (#127):** An assessment was conducted to determine potential Project-related effects on human health. The assessment was carried out using both a quantitative HHRA and a qualitative health impact assessment and considered: • Exposure to air emissions; • Exposure to noise and vibration; • Exposure to shellfish contamination; • Stress and annoyance; • Employment and income; • Food security, including potential changes in availability of traditional food; and • Health inequity, referring to the distribution of Project-related risks and benefits. The sub-component of health inequity assessed potential effects related to unequal distribution of Project-related benefits and Project-related adverse effects. The sub-components of stress and annoyance and employment and income assessed factors related to mental wellbeing. The rationale for selection of VC sub-components and indicators is provided in the EIS. The human health assessment concludes that: • The Project is not expected to result in any significant adverse effects on human health. Incremental adverse cumulative effects to human health are expected to be negligible.	**EIS** 27.0 Human Health 27.6.1 Rationale for Determination of Negligible Effects 27.6.5 Potential Effect #4 – Adverse Health Outcomes due to Changes in Health Inequity Appendix 7.2-B Aboriginal Issues and Interests **AIMSA** Appendix 2-B Aboriginal Issues and Interests 3.0 Human Health 3.1.2 Tsleil-Waututh Nation 7.0 Current Use of Lands and Resources for Traditional Purposes and Aboriginal and Treaty Rights 7.2.2.3 Other Cultural Practices and Considerations 7.3 Potential Interactions and Effects on Current Use **Information Requests**

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
	studies and results integration into the EIS and MSA. Stated that in order for a Human Health assessment to be sufficient it must include Aboriginal Groups. Stated that the assessment must include an appropriate baseline to assess effects from. Stated that an Aboriginal specific health assessment needs to be calculated in the human health chapter to ensure that these effects are properly calculated into the cumulative effects assessment. Requested that an Aboriginal Group specific Health Assessment is incorporated into the Project. Stated that for Tsleil-Waututh Nation, overall quality of life, health, and ability to function are measured far beyond the factors of overweight/obesity, diabetes, mortality, personal health behaviours and high blood pressure. Stated that the health and well-being of Tsleil-Waututh Nation is equally tied to the physical, spiritual, cultural, and economic connection to ancestral lands and waters, and the place names, language, beliefs, and stories associated with those areas. Stated that the concept of health relates to Tsleil-Waututh Nation's position within or relation to a holistic and functioning ecosystem – and Tsleil-Waututh Nation's ability to access and use the ecosystem, without any concern about the adverse impacts from pollution or contamination. Stated that there is a substantial gap in the health assessment (Section 27) in the EIS for Aboriginal groups. Stated that cultural health is not only limited to harvesting traditional foods, but also the connection to cultural heritage and other sacred places. For example, the impacts to health from the Project are not only biophysical in scope, but can also be mental, socio-cultural, spiritual and emotional due to impacts on key cultural values.		**12-May-2016, Letter from the CEA Agency (CEAR Document #399):** *"The Agency requested additional information on cultural heritage in AIR #10 Cultural Heritage Assessment, which may partially address these concerns.* *In addition, the Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	• Potential Project-related effects on human health are expected to be fully or partially mitigated through the implementation of environmental management plans (EMPs) and additional mitigation measures. • The Project would result in measurable residual effects for exposure to air emissions during construction and exposure to noise during construction and operation. Mitigation is expected to reduce all other residual effects to a negligible (i.e., not measurable) level. **Addressed in AIMSA Appendix 2-B (#15):** The concept of health as described here is acknowledged within the human health assessment in the MSA, and in the AIMSA specific to Tsleil-Waututh Nation. The information provided on Tsleil-Waututh's concept of health was included in AIMSA Section 3.1.2. • While the human health effects assessment in AIMSA Section 3.0 addresses a limited number of biophysical health effects, effects on cultural health can be inferred from the assessment of Current Use. The Current Use assessment draws on the conclusions of all relevant biophysical assessments of the effects of marine shipping associated with the Project on land and water, and considers the connection between access to, and use of, ancestral lands and waters and the intangible cultural heritage (e.g., place names, language, beliefs, and stories) associated with those lands and waters. The assessment infers that an effect on the ability to access and use those lands and waters could also affect quality of Current Use experience or cultural heritage associated with those lands and waters. An effect on intangible cultural heritage could in turn affect cultural health. **Addressed in response to MSA IR-02.24.16-10:** Further information on how the EIS and MSA address cultural heritage is discussed in the VFPA's response to MSA IR-02.24.16-10. **Addressed in response to IR10-22:** The VFPA's response to IR10-22, as requested by the Review Panel, further discusses the assessment of cultural heritage, potential disruptions or loss of ceremonial and cultural practices, as well as a potential disruption to sense of belonging, identity, and spirituality**.** **Addressed in response to IR13-19:** The VFPA's forthcoming response to IR13-19 will further discuss potential effects of shoaling on shoreline structures and sites of physical and cultural heritage importance.	Response to MSA Additional Information Request #10 (MSA IR-02.24.16-10 of CEAR Document #386) Response to Sufficiency Information Request#22 (IR10-22) Response to Sufficiency Information Request#19 (IR13-19)

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
	Stated that Tsleil-Waututh views the lack of an effects assessment and associated mitigation measures on cultural health, which is indicated as a component of the EIS as a gap in the EIS.				

Table 11: Marine Commercial Use – Valued Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information

TWN-11.1	Asked whether the VFPA has spoken to Crab Management Area I commercial DFO license holders.
	Asked about potential harvester displacement, and whether DFO is going to compensate by putting license holders in other areas.
	Asked about whether consultation with commercial crab harvesters would involve DFO.
		20-Nov-2014, Health and Aboriginal Rights Workshop – Tsleil-Waututh Nation
		03-Aug-2016, Issues Workshop - Tsleil-Waututh Nation, Métis Nation British Columbia, and Semiahmoo First Nation
			20-Nov-2014, Workshop:
			Responded that the VFPA will take this question back. Recalled that the marine commercial use effects assessment considers how the Project will affect those licence holders, in terms of commercial fishing.
			01-Apr-2015, Letter from the VFPA:
			Provided a copy of the EIS, which included EIS Section 21.0 on Marine Commercial Use.
			03-Aug-2016, Workshop:
			Stated that from the commercial perspective, the commercial crab fishery was looked at in the Project area. It is known that commercial crab harvesting takes place in Management Area I and in subareas in proximity to the Project. The EIS acknowledges the displacement of harvesters from two areas: the terminal footprint itself, and the expansion of the navigational closure area (implemented for navigational and marine safety).
			The VFPA acknowledges that there will be displacement, with an understanding that it could affect harvest and revenue generation. The intent is to meet with harvesters, discuss mitigation, and consult directly with them to discuss the displacement effect. Details for this plan have not been determined yet, but the VFPA will be consulting with commercial crab harvesters. In the EIS, the VFPA said that it would work with DFO on this topic.
			The EIS discusses the potential for licence holders in Area I to apply for licences in another management area. That is a potential outcome, and hence the requirement for mitigation to see what implications there might be in relation to the commercial crab harvest.
			With regard to Current Use and rights, unlike the commercial crab harvest, there is no discussion in the EIS of moving licences. The existing navigational closure area is an exclusive use area for food, social, and ceremonial (FSC) harvesters, in that Indigenous FSC harvesters can use the area without floats. That area would be expanded with the new terminal, resulting in a doubling of the area closed to commercial and recreational crab harvesters. The intent is that access for Indigenous groups with FSC or domestic licences would extend into that expanded area. The VFPA is willing to work with DFO to continue to support the current arrangement in an expanded closure area.
			The VFPA is interested in hearing suggestions, feedback, and input into concepts for mitigation related to the displacement of commercial harvesters.
			12-Apr-2018, Letter from the VFPA:
			Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to
				Addressed in EIS Section 21.0:
				Crab Management Area (CMA) I representatives were interviewed and was reported in EIS Section 21.0.
				Additional information provided in IR7-34:
				The VFPA is committed to continue working with DFO, commercial crab harvesters, and Indigenous groups to share information and provide opportunities for questions and discussion.
				A summary of consultation and engagement activities that have been undertaken post-EIS submission and are ongoing with the following stakeholders, Indigenous groups, and regulatory agencies is provided below:
				• Commercial crab harvesters: Meetings with Area I Crab Fisherman Association directors to discuss mitigation options, access of additional electronic monitoring data, and additional data analysis (as presented in the VFPA's responses to IR7-33 and IR7-35);
				• Individual Indigenous groups with CMA I Commercial Crab Licences, including Tsawwassen First Nation, Musqueam First Nation, and Malahat Nation;
				• Indigenous groups:
				  ○ Meetings and workshops with the *W̱SÁNEĆ* to discuss additional input (*Additional Information to the Environmental Impact Statement – W̱SÁNEĆ Nation*, CEAR Document #930);
				  ○ Invitations to post-EIS meetings and workshops extended to all identified Indigenous groups (*Updated EIS Guidelines*, April 17, 2015) to review EIS results and obtain input on potential mitigation measures to address Project effects, which included effects on commercial crab harvesting;
				  ○ Meetings held with individual Indigenous groups where individuals or administration has expressed an interest in further discussion regarding commercial crab harvesting; and
				  ○ RBT2 Follow-up Program planning workshops with Indigenous groups;
				• Regulatory agency: Discussions with DFO regarding consultation activities with crab harvesters and evaluation of suggested additional mitigation measures; and
				• Recreational crab harvesters and public consultation: See the VFPA's response to IR7-43.
				Addressed in response to IR13-16:
				The VFPA's forthcoming response to IR13-16 will further provide an update concerning ongoing consultation related to crab harvesting.
				Addressed in response to IR13-23:
				The VFPA's forthcoming response to IR13-23 will further discuss Indigenous groups' ability to harvest crab for FSC purposes.

			gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the RBT2 Crab Mitigation Summary Overview, which detailed the following: • Mitigation measures to avoid or reduce effects to crab as outlined in the EIS; and • Additional crab harvesting related mitigation measure suggestions under review. Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.		
TWN-11.2	Stated that although socio-economic condition studies were conducted for other Aboriginal groups (Appendices 18-A and 18-B), no socio-economic conditions study was offered to or conducted with Tsleil-Waututh Nation. Stated that only limited and dated socio-economic information is provided for Tsleil-Waututh Nation in Volume 4 (e.g., the Tsleil-Waututh Nation Comprehensive Community Plan is five years old and only pertains to Tsleil-Waututh Nation reserve lands}. From Tsleil-Waututh Nation's perspective, Aboriginal Peoples, of the EISG has not been completed in the EIS. Concerned with the socio-economic assessment, and particularly the section concerning commercial seafood harvesting. Concern that the socio-economic assessment did not include input from all Aboriginal groups.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #249) 15-Dec-2015, Meeting	**13-Oct-2015, Letter from the CEA Agency (CEAR Document #313):** *"The Agency has requested additional information on this item in its letter of July 31, 2015 to [the VFPA] (page 12, #26)."* **15-Dec-2015, Meeting:** Recorded comment for consideration by the Project team.	**Addressed in EIS Appendix 7.2-B (#116):** A description of the scope and methods of the marine commercial use assessment is provided in EIS Section 21.0. • EIS Section 21.0 considers potential effects on marine fish harvesting, seafood harvesting (including crab), guided sport fishing, and marine-based tourism. • The rationale for the selection of the spatial boundaries is provided in the EIS. • Relevant information was sought from all Indigenous groups that hold commercial fishing licences. • The cumulative effects assessment takes into consideration the potential residual effects of the Project in combination with the effects of other projects and activities that have been or will be carried out, including those in the lower Fraser River. **Addressed in response to IR-7.31.15-26:** The economic sections (including EIS Sections 19.0, 20.0, 21.0, and 22.0) and the socio-community sections (including Sections 23.0 and 24.0) present general social and economic conditions of Indigenous communities that might be affected by the Project, where there were identified differentiating existing conditions for these communities. Existing conditions was also presented in these sections for the aggregated Indigenous population (i.e., not for individual Indigenous groups) where this aggregated presentation of existing conditions is relevant and applicable to the specific socio-economic VC. General social and economic conditions were presented separately for Tsawwassen First Nation and Musqueam First Nation, where there are identified differentiating conditions, because both groups: • Were identified by the CEA Agency as being at the "high end of the consultation spectrum"; • Have either treaty or reserve lands or communities located in close proximity to the Project; • Have community, social, and/or economic activities occurring at, or in close proximity, to the Project; and • Exercise established rights (including treaty rights) at or in close proximity to the Project. Table IR26-1 summarises where differential existing socio-economic conditions are presented for Tsawwassen First Nation, Musqueam First Nation, and for other Indigenous groups, and a rationale for presentation of existing information for certain Indigenous groups.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 8.0 Effects Assessment Methods 8.1.9 Cumulative Effects Assessment 21.0 Marine Commercial Use 21.2 Selection of Marine Commercial Use Valued Component 21.3.1 Spatial Boundaries **Information Requests** Response to Information Request #26 (IR-7.31.15-26 of CEAR Document #314) Response to Sufficiency Information Request #07 (IR10-07) Response to Sufficiency Information Request #14 (IR10-14) Response to Sufficiency Information Request #27 (IR10-27) Response to Sufficiency Information Request #28 (IR10-28)

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
				Addressed in responses to IR10-07, IR10-14, IR10-27, and IR10-28: The VFPA's responses to IR10-07, IR10-14, IR10-27, and IR10-28, as requested by the Review Panel, further discuss aspects of socio-economic conditions of Indigenous Peoples.	
TWN-11.3	Stated that in Volume 4, Section 21.1.1, Aboriginal Commercial Fishing and Seafood Harvesting, the VFPA failed to address our concern related to this section in their letter dated March 25, 2015, only directing us back to Section 21, which appears to be unchanged. We restate our concern and require a response: "In Section 2.1.1, the focus on fish licenses and the aspects of fisheries that are accessed by First Nations through agreements with the Department of Fisheries and Oceans (DFO), is a significant gap. Tsleil-Waututh considers a much more holistic definition of fisheries in comparison to this draft section, which includes such elements as habitat, broader conservation concerns, longterm impacts of climate change and shifting food webs, access for current and future generations, and planning. Tsleil-Waututh considers these elements in relation to the cultural connections to the Fraser River and surrounding landscape. Through cultural connections and beliefs of Tsleil-Waututh the fisheries are and have been viewed as a way of life for our people and other Coast Salish Nations since time immemorial. Tsleil-Waututh current and desired fisheries practices and uses expand well beyond what is accessed through DFO agreements, and is not defined by DFO."	15-Jan-2015, Letter 15-Jun-2015, Letter to the CEA Agency (CEAR Document #249)	**25-Mar-2015, Letter from the VFPA:** Directed Tsleil-Waututh Nation to EIS Section 21.0 for further information in relation to the concern. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 21.0 on Marine Commercial Use. **13-Oct-2015, Letter from the CEA Agency (CEAR Document #313):** *"The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	**Addressed in EIS Section 21.0:** Sources of information for the marine commercial use assessment included the following: • Review of secondary sources and analysis of information with respect to marine commercial use within the LAA and RAA; and • Analysis of information gathered through the VFPA's public and stakeholder consultation and Indigenous group consultation processes. Secondary information sources included DFO harvesting statistics and fishing management plans, as well as relevant studies and reports produced by DFO, Pacific Whale Watch Association (PWWA), Nelson Bros Fisheries Ltd., and academic sources. The Tsawwassen First Nation Final Agreement and Harvesting Agreement and Musqueam First Nation's comprehensive fisheries agreement were reviewed with respect to commercial allocations. Secondary sources cited are listed in EIS Section 21.15. In 2013, the VFPA initiated desktop and primary data collection studies to support the assessment of effects on marine commercial use that were designed to address known data gaps. The objectives of the relevant studies are summarised in EIS Table 21-4. Building on available secondary information, interviews were conducted with key subject matter experts, including industry participants, for the following purposes: • Clarifying data obtained through secondary sources; • Acquiring additional information; • Identifying potential interactions of the Project with marine commercial use; and • Identifying marine commercial use interests and concerns related to the Project. Information obtained from interviewees is referenced within the text of the assessment and in EIS Section 21.15.	**EIS** 21.0 Marine Commercial Use 21.4 Information Sources 21.4.1 Desktop and Field Studies 21.15 References Table 21-4 Studies to Support Assessment of Marine Commercial Use

Table 12: Marine Fish – Valued Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-12.1	Requested that 'impact to critical life history stages of fish' is added.	09-May-2014, Letter	**09-May-2014:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 13.0 on Marine Fish.	**Addressed in EIS Section 13.0:** This comment was considered and incorporated into EIS Section 13.0. The critical life history stages are described for five fish sub-components (including 13 representative species) by life history requirements, habitat use, and the factors influencing growth, reproduction, survival, food web interactions, and prey availability of marine fish.	**EIS** 13.0 Marine Fish
TWN-12.2	Concerned with the effect of noise on species other than marine mammals, and asked how this has been assessed.	28-Oct-2014, Preliminary EIS Workshop #3	**28-Oct-2014, Workshop:** Stated that the effects of underwater noise on fish was assessed. Stated that with fish there is more of a concern for injury as opposed to behavioural disturbance. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Section 9.8 and EIS Appendix 7.2-B (#61):** The scope and methods of the underwater noise study are summarised in the EIS section, and detailed in the supporting appendix. Underwater noise considers the level of underwater sound in the marine environment. An assessment was undertaken to determine potential changes in underwater noise as a result of the Project and focused on construction and operation activities that would produce underwater noise. Modelling was undertaken to predict future underwater noise as a result of construction activities, such as dredging, pile driving, vibro-densification, and operation activities, such as movements of container ships and tug boats associated with terminal approach and departure, and berthing and unberthing. The assessment concludes that: • Underwater noise levels during construction are predicted to be comparable on average to existing levels measured at Roberts Bank, with the exception of some periods when certain construction activities. • Overall, average underwater noise from Project construction and operation activities is expected to be comparable to average existing levels of underwater noise due to existing high levels, but will at times exceed existing conditions. Underwater noise related to conservative levels of Project commercial vessel movements is predicted to increase over existing underwater noise levels for only approximately 3% of a year for vessel berthing and unberthing, and for approximately 2% of a year for vessel approach and departure. • Future cumulative increases in commercial vessel traffic in the region are expected to make a relatively small incremental contribution to overall underwater noise levels. This prediction reflects the existing high levels of vessel traffic within the study area and the already-dominant contribution of commercial vessel traffic noise to the acoustic environment. The results of the underwater noise assessment were considered in the assessments of marine fish, marine mammals, and coastal birds. An interaction between Project-related underwater noise and marine invertebrates is not anticipated, and therefore was not assessed. With mitigation, including implementation of Underwater Noise Management Plans during Project construction and operation, potential effects (i.e., injury and behavioural change) to marine fish from changes in the acoustic environment are considered negligible. A residual effect is identified for Pacific herring; however, it is assessed as not significant as the disturbance is anticipated to occur only if impact piling is employed, it will be temporary and restricted to a relatively small area around the sound source. **Addressed in the PCU:** As requested by the RBT2 Review Panel, the VFPA submitted the PCU on June 12, 2018, providing	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 9.8 Underwater Noise 9.8.2 Assessment of Purpose and Approach 9.8.6 Methods Appendix 9.8-A Construction and Terminal Activity Underwater Noise Modelling Study Technical Report Appendix 9.8-B Regional Commercial Vessel Traffic Underwater Noise Modelling Study Technical Report 13.0 Marine Fish 13.6 Future Conditions with the Project 14.0 Marine Mammals 14.6 Future Conditions with the Project 15.0 Coastal Birds 15.7 Future Conditions with the Project **Project Construction Update (PCU, CEAR Document #1210)** 1.0 Introduction 2.0 Revised Project Description and Schedule 3.0 Summary of Changes to the Environmental Impact Statement

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
				• Detailed revised Project description, including a revised construction schedule; • Revised Project interaction matrix; • Preliminary details pertaining to the management and timing of dredging activities and the discharge of sediment-laden water; and • Revised assessment of environmental effects as required by the Project modifications. Sections 1.0 and 2.0 of the PCU describe the changes to the EIS, including updates to specific construction activities, the construction schedule, and relevant Project description figures and appendices. In PCU Section 3.0, changes or effects resulting from the construction updates on ICs and VCs are described. Overall, these changes to the environmental assessment resulting from construction updates can generally be summarised as follows: • Reductions in potential adverse changes or effects on ICs, biophysical VCs, social VCs, and Current Use; and • Increases in positive interactions with socio-economic VCs. These beneficial changes to ICs and VCs occur at the level of interactions or potential effects, and in most cases are slight changes, and thus do not affect the overall conclusions made in the EIS, including proposed mitigation, residual effect characterisations, significance determinations or cumulative effects, as applicable, with one exception. The only component predicted to have a change to residual effects is land and water use, with a reduction of a residual effect on access to Tsawwassen First Nation community lease lands from a measurable non-significant residual effect to a negligible residual effect, due to elimination of the ITP and associated activities.	
TWN-12.3	Asked why/how some forage fish, in particular herring, are expected to experience a slight to moderate increase in productivity.	20-Nov-2014, Health & Aboriginal Rights Workshop - Tsleil-Waututh Nation	**20-Nov-2014, Workshop:** Stated that the Roberts Bank Ecosystem Productivity VC presentation explained the development of a model that was used for the Project's assessment. The assessment models existing and predicted conditions without and with the Project prior to mitigation, based on inputs such as changes in currents and salinity (for example). The productivity for forage fish was a conclusion of the model. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 13.6.3.3 on Changes in Productivity of Forage Fish.	**Addressed in EIS Section 13.6.3.3:** EIS Section 13.6.3.3 discusses biotic interactions that contribute to predictions of a minor decrease in overall forage fish productivity. Biotic interactions play a key role in shaping forage fish productivity at Roberts Bank, with forage fish being important conduits of energy in the marine food web between planktonic communities and higher trophic-level predators. Direct Project-related effects on prey, predators, and competitors, along with more complex indirect trophic interactions, are predicted to cause increases and decreases in forage fish at Roberts Bank The decrease in overall forage fish predicted by the ecosystem model (i.e., –1%, –11 tonnes (t)) is negligible as changes less than 5% are judged to fall within the uncertainty of the model; sensitivity analyses indicate this value is robust, but that there may be small over- or under-estimations, depending on the representative species.	**EIS** 13.0 Marine Fish 13.6.3.3 Changes in Productivity of Forage Fish
TWN-12.4	Requested additional information about the presence of reef fish as a result of artificial habitat created as part of the Deltaport Third Berth (DP3) Project. Asked if reef fish existed there before.	20-Nov-2014, Health & Aboriginal Rights Workshop - Tsleil-Waututh Nation	**20-Nov-2014, Workshop:** Responded that DP3 habitat compensation included the creation of an artificial reef, which has attracted reef fish such as lingcod, which did not use to the area before, since it was previously a sandy bottom habitat.	**Additional information provided by VFPA:** AMS annual reports on DP3 mitigation measures are available at the following link: https://www.portvancouver.com/development-and-permits/status-of-applications/deltaport-third-berth-project/	
TWN-12.5	Requested that the effects of sockeye and all Pacific salmon species be assessed, not just chum salmon.	20-Nov-2014, Email	**20-Nov-2014:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:**	**Addressed in EIS Section 13.0:** All species of Pacific salmon were considered in the assessment of Project-related effects through the use of representative species. Sockeye, pink, and coho salmon were represented by Chinook and chum, which are the most	**EIS** 13.0 Marine Fish **Information Requests** Response to Additional Information Request #9 (AIR-

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
			Provided a copy of the EIS, which included EIS Section 13.0 on Marine Fish.	estuarine-dependent species of Pacific salmon, and therefore most likely to be affected by the Project. A field sampling program for salmon was conducted at Roberts Bank in 2012 and 2013. While it is possible that 2012 to 2013 seasonal surveying for the Project did not capture all salmon species present at Roberts Bank, historical survey data add to the weight of evidence, suggesting a realistic representation of species composition and abundance at Roberts Bank. **Addressed in response to IR5-15:** In its response to IR5-15, the VFPA specifically discusses existing conditions related to sockeye salmon and describes the status and management practices associated with the species. Rationale as to how sockeye salmon were assessed via use of Chinook and chum salmon as representative species, as well as similarities between species as they pertain to existing conditions (e.g., life history and habitat requirements), the mechanisms through which the Project may affect sockeye salmon, as well as effectiveness of mitigation, are presented in AIR-12.04.15-09, including Appendix AIR9-A Table 2, and in the response to IR5-15.	12.04.15-09 of CEAR Document #388) Response to Sufficiency Information Request #5 (IR5-15 of CEAR Document #1078)
TWN-12.6	After learning about the herring spawning study, Tsleil-Waututh Nation requested to be notified within 5 days if herring spawning activity is in the area. In regards to the herring spawning study, asked: 1. When will the survey/study be available? 2. Where are the locations in relation to the RBT2 Project? 3. What are the next steps for the Proponent with these new findings? 4. Tsleil-Waututh Nation would like to state that we strongly believe in protecting spawning habitat, and are extremely interested in how these findings will be integrated into the EA application and Project overall. Stated that this is especially given that a) Tsleil-Waututh Nation would like to see Herring return to the Inlet, and a growth of population in another nearby area could potentially lead to this outcome in the future, and b) herring abundance has been declining recently. Asked if the VFPA can first provide any/all information/documents that are available post-study/field day? Stated that Tsleil-Waututh Nation would like to know more about the outcomes, plans, locations etc. prior to a discussion, which we may be open to after reviewing anything available.	10-Apr-2017, Email 18-Apr-2017, Email 03-May-2017, Email	**11-Apr-2017, Email from the VFPA:** Stated that the study was scoped based on feedback that there is herring spawning in the area, so there is expectation that the VFPA will find herring spawning, or evidence that herring spawning already occurred. Stated that the VFPA can notify Tsleil-Waututh Nation as to whether herring spawning is identified during the survey. **18-Apr-2017, Email from the VFPA:** *"The dive team surveyed the large native eelgrass bed on the north side of the causeway, starting where herring spawn were reported to have been observed a week ago (T1 on the attached map). No spawn or spawn residue was observed. Two more transects were completed and again, no spawn or residue was observed. We are confident that whatever spawn might have been there a week or two ago is no longer present.* *The boots-on-the-ground team surveying the inter-causeway area at low tide found evidence of spawn in the intertidal eelgrass bed adjacent to the tug basin (see attached photos); two small patches with eggs were found (~2m x 0.5 m; and 5m x 2m long) but there appears to be egg residue over a larger area. The eggs are very patchy, about 1-2 layers thick, and do not appear to be fresh."* **01-May-2017, Email from the VFPA:** Followed up with Tsleil-Waututh Nation to set up a meeting to discuss the herring surveys and Tsleil-Waututh Nation's recent questions.	**Addressed in response to IR4-18:** As noted in the VFPA's response to IR4-18, in response to anecdotal reports by a member of the public of herring spawn on eelgrass on the north side of the Roberts Bank causeway in early April 2017, the VFPA conducted a survey to document presence and distribution of herring spawning activity at Roberts Bank. Survey results are in agreement with existing conditions described in EIS Section 13.5.3.3, and confirm that while the LAA does support some spawn, it does not appear to be an important herring spawning area. Adherence to EMPs (see EIS Section 33.3) will reduce the potential that herring will be affected by changes to water quality and sediment, or underwater noise during Project construction activities that will occur outside the fisheries-sensitive window. Notwithstanding the above, a potential for interaction with the Project has been identified and a residual effect has been assessed as not significant (see EIS Section 13.8.1).	**EIS** 13.0 Marine Fish 13.5.3.3 Pacific Herring 13.8.1 Residual Effect – Characterisation of Productivity Loss 33.3 Construction Environmental Management Plans **Information Requests** Response to Sufficiency Information Request #18 (IR4-18 of CEAR Document #1051)

Table 13: Marine Invertebrates – Valued Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-13.1	Asked whether there are specific mitigation measures for bivalves and whether the offsetting described is part of THE VFPA's Habitat Enhancement Program.	29-Oct-2014, Preliminary EIS Workshop #4	**29-Oct-2014, Workshop:** Stated that the VFPA is not aware of specific plans for bivalves within the Project footprint; the focus has primarily been on crabs. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 12.0 on Marine Invertebrates.	**Addressed in EIS Section 12.0 and EIS Appendix 7.2-B (#71):** Bivalve shellfish (e.g., clams and cockles) were assessed as a sub-component of the marine invertebrates assessment. Productivity decreases for bivalve shellfish are predicted and can be partially mitigated through the implementation of EMPs (including salvaging and transplanting), the creation of onsite intertidal marsh habitat, and other onsite offsetting measures. While the Project is predicted to cause losses of productivity of bivalve shellfish, the scale of change is minor in the context of natural variability and will not compromise population integrity or ecological function. Mitigation to reduce Project-related effects to bivalve shellfish would also mitigate potential changes in the availability of preferred Current Use resources for Indigenous groups. Eelgrass creation as part of onsite offsetting is expected to benefit heart cockle productivity. Increased rip-rap and hard substrate post-Project will provide additional habitat for epifaunal bivalves including giant Pacific oysters and bay mussels. The VFPA is committed to developing and implementing a Follow-up Program for RBT2. The Follow-up Program will be developed after the submission of the EIS, in consultation with federal agencies, including the CEA Agency, DFO, and ECCC. Consultation with these regulatory agencies will ensure that the program will deliver the type, quantity, and quality of information required to reliably verify predicted effects (or absence of them), and to confirm both the assumptions and the effectiveness of mitigation. The need for shellfish monitoring will be considered in consultation with these agencies.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 12.0 Marine Invertebrates 12.2 Selection of Marine Invertebrates Valued Component 12.6 Future Conditions with the Project 33.0 Environmental Management Program 33.5 Roberts Bank Terminal 2 Follow-up Program
TWN-13.2	Requested reports showing the connection between sediment and benthic transfer to marine invertebrates, in particular crabs.	20-Nov-2014, Health & Aboriginal Rights Workshop - Tsleil-Waututh Nation	**20-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **26-Jun-2017, Letter from the VFPA:** *"The concerns brought forward by Tsleil-Waututh Nation with regard to Dungeness Crabs and DAS highlighted the need for the VFPA to re-evaluate our planned construction approach and use of the ITP as a part of the Project. The Project team has been actively exploring alternative construction methods to address concerns raised by Indigenous groups and regulatory agencies since the development of the EIS in 2014.* *After undertaking a thorough investigation that included further engineering work, consideration of new locally available dredging equipment, and relaxation of the Coasting Trade Act as a result of approving the Canadian European Trade Agreement, the port authority determined that the Project could proceed without the use of an ITP. In addition, the elimination of the ITP, along with other changes will result in a Project that does not require a DAS permit."*	**Addressed in PCU:** As requested by the RBT2 Review Panel, the VFPA submitted the PCU on June 12, 2018, providing: • Detailed revised Project description, including a revised construction schedule; • Revised Project interaction matrix; • Preliminary details pertaining to the management and timing of dredging activities and the discharge of sediment-laden water; and • Revised assessment of environmental effects as required by the Project modifications. Sections 1.0 and 2.0 of the PCU describe the changes to the EIS, including updates to specific construction activities, the construction schedule, and relevant Project description figures and appendices. In PCU Section 3.0, changes or effects resulting from the construction updates on ICs and VCs are described. Overall, these changes to the environmental assessment resulting from construction updates can generally be summarised as follows: • Reductions in potential adverse changes or effects on ICs, biophysical VCs, social VCs, and Current Use; and • Increases in positive interactions with socio-economic VCs. These beneficial changes to ICs and VCs occur at the level of interactions or potential effects, and in most cases are slight changes, and thus do not affect the overall conclusions made in the EIS,	**PCU** 1.0 Introduction 2.0 Revised Project Description and Schedule 3.0 Summary of Changes to the Environmental Impact Statement

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
				including proposed mitigation, residual effect characterisations, significance determinations or cumulative effects, as applicable, with one exception. The only component predicted to have a change to residual effects is land and water use, with a reduction of a residual effect on access to Tsawwassen First Nation community lease lands from a measurable non-significant residual effect to a negligible residual effect, due to elimination of the ITP and associated activities.	
TWN-13.3	Requested additional information about the proposed mitigation measures for marine invertebrates.	20-Nov-2014, Health & Aboriginal Rights Workshop - Tsleil-Waututh Nation	**20-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 12.0 on Marine Invertebrates and 12.7 on Mitigation Measures. **12-Apr-2018, Letter from the VFPA:** Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the RBT2 Crab Mitigation Summary Overview, which detailed the following: • Mitigation measures to avoid or reduce effects to crab as outlined in the EIS; and • Additional crab harvesting related mitigation measure suggestions under review. Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.	**Addressed in EIS Section 12.7:** Mitigation measures applicable to marine invertebrates are discussed in EIS Section 12.7. In summary: Direct Mortality to occur during construction phase Timing Windows: DFO least-risk timing window for crabs (October 15 to March 30) will protect gravid females from activities occurring below −5.0 m chart datum. Crab Salvage Program: Will take place prior to commencing dredging activities and infilling containment dykes (terminal and causeway). Crabs will be trapped and released to suitable habitat distant from Project activities. Orange Sea Pen Transplant: Will employ SCUBA to collect a small portion of the orange sea pen bed for transplant to suitable sites adjacent to, but outside of, Project-affected areas at Roberts Bank. Construction EMP and supporting plans, including: Construction Compliance Monitoring Plan; Environmental Training Plan; Dredging and Sediment Discharge Plan; Sediment and Erosion Control Plan; Hazardous Materials and Waste Management Plan; and Spill Preparedness and Response Plan. Operation EMP and supporting plans, including: Operation Compliance Monitoring Plan; Environmental Training Plan; Hazardous Materials and Waste Management Plan; Spill Preparedness and Response Plan. Productivity – Construction and Operation Phases. Project Design: Optimised Project design, including terminal placement in subtidal waters, reduced footprint for causeway widening, terminal rounded corner, and incorporation of rocky shoreline in portions of the terminal and causeway perimeters. Offsetting Plan: Where losses to ongoing productivity of marine invertebrates cannot be avoided, losses will be mitigated by the enhancement of existing or creation of new habitats, such as eelgrass, tidal marsh, mudflat, sandy gravel beaches, and subtidal rock reefs. Offsetting measures will be developed in consultation with relevant regulatory bodies and stakeholders (see EIS Section 17.3.2).	**EIS** 12.0 Marine Invertebrates 12.7 Mitigation Measures 17.0 Mitigation for Marine Biophysical Valued Components 17.3.2 Offsetting Framework
TWN-13.4	Asked if this project is being used as an opportunity to gather more information on Orange Sea Pens, and for additional information regarding the density of Sea Pens in the Project area. Requested information about the success of the	06-Jun-2014, Valued Components Workshop #1 28-Oct-2014, Preliminary EIS Workshop #3 20-Nov-2014, Health & Aboriginal	**06-Jun-2014, Workshop:** Stated that nudibranch and sea star eat orange sea pen, but not fish. **28-Oct-2014, Workshop:** Reviewed existing conditions for orange sea pens, expected conditions at Project commencement, potential Project-related effects. Stated that there is not a lot of information available on sea pens, and based on the information that is available, the VFPA could not find anything to suggest that densely	**Addressed in EIS Section 12.0 and EIS Appendix 7.2-B (#73):** Orange sea pens are a soft coral species that depend on habitat with strong tidal outflows and oceanic currents for food delivery. Sea pen beds provide habitat for many benthic (bottom dwelling) species and likely play a role in maintaining productive near-shore communities for clams, sea stars, marine worms, Dungeness crabs, and several fish species. Orange sea pens were assessed as a sub-component of the marine invertebrates VC. The assessment concludes that a decrease in the productivity of orange sea pens due to direct mortality and changes in habitat availability is expected as a result of permanent loss of subtidal	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 12.0 Marine Invertebrates 12.6.3 Potential Effect – Changes in Productivity Table 12-8 Summary of Roberts Bank Ecosystem Model Productivity Results for Marine Invertebrates

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
	Orange Sea Pen transplant project. Concerned that there are no separate sea pen studies included in the EIS or its appendices.	Rights Workshop - Tsleil-Waututh Nation	populated areas of sea pens are common, which makes those at Roberts Bank pretty special. Stated that the VFPA is just finishing a pilot study, and preliminary results indicate they're doing well. **20-Nov-2014, Workshop:** Stated that a pilot study has been carried out. The transplant team went back a month later and the sea pens were doing well, and they will be checked on again. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 12.0 on Marine Invertebrates. **07-Feb-2018, Letter from the VFPA:** *"Starting in 2014, the RBT2 Project team conducted a pilot study to test a method for transplanting orange sea pens, which involved transplant of 1200 orange sea pens to three sites within the local assessment area for the Project. Please find attached a report titled Orange Sea Pen Transplant Pilot and Monitoring Program. The results of the study show that the pilot sea pen transplant was successful, with stable densities and evidence of recruitment at two of the three transplant sites. This report will be submitted to the Review Panel shortly with the VFPA's response to Information Request IR5-05."*	sand habitat associated within the terminal footprint. This decrease can be partially mitigated through the implementation of EMPs, including the collection and transplantation of orange sea pens to nearby undisturbed sites identified as suitable through habitat modelling. While the Project is predicted to cause losses of productivity of orange sea pens, the scale of change is minor in the context of natural variability and will not compromise the population integrity or ecological function. The residual effect was determined to be not significant. **Addressed in response to IR5-05:** Further information is provided in the VFPA's response to IR5-05, which describes the results of the pilot study. In summary, the pilot sea pen transplant was successful. Stable densities, and evidence of recruitment, at two of the three transplant sites demonstrate that not only can environmental conditions successfully be used to predict habitat suitability for orange sea pens across a larger study area, but also attests to the ecological viability of transplantation as a potential mitigation method.	Table 12-10 Habitat Suitability (ha) for Orange Sea Pens in the Local Assessment Area in Future Cases With and Without Roberts Bank Terminal 2 12.7.2 Mitigation #1 for Direct Mortality 12.8.1 Residual Effect – Characterisation of Productivity Losses 12.9.2 Significance Determination Table 12-15 Summary of Determination of Significance of Residual Effects for Marine Invertebrates **Information Requests** Response to Sufficiency Information Request #5 (IR5-05 of CEAR Document #1145)

Table 14: Marine Mammals – Valued Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-14.1	Requested that 'impacts to species listed under *Species at Risk Act*' is added under the marine mammals VC.	09-May-2014, Letter	**09-May-2014:** Recorded comment for consideration by the Project team.	**Additional information provided by the VFPA:** This comment was considered and incorporated into the EIS for each of the VCs, not only for marine mammals. For example, in EIS Section 14.1.1, marine mammal species listed under the *Species at Risk Act* that were considered in the effects assessment included: • Southern resident killer whale (Endangered); • Transient killer whale (Threatened); • Fin whale (Threatened); • Eastern Pacific grey whale (Special Concern); • North Pacific humpback whale (Threatened); • Harbour porpoise (Special Concern); and • Steller sea lion (Special Concern). Due to the differences between toothed whales, baleen whales, and seals and sea lions in regard to life history, prey preferences, and hearing sensitivities, one representative species was selected to represent each sub-component (i.e., toothed whales, baleen whales, and seals and sea lions) for the purposes of this assessment. To be conservative and precautionary, the representative species with the greatest conservation status under the *Species at Risk Act* was selected to represent each sub-component group (i.e., southern resident killer whale, humpback whale, and Steller sea lion).	**EIS** 14.0 Marine Mammals 14.1.1 Endangered and Threatened Species under *Species at Risk Act*
TWN-14.2	Concerned with behavioural and cultural disruptions to marine mammals.	09-May-2014, Letter	**09-May-2014:** Recorded comment for consideration by the Project team. **30-Sep-2017, Letter from the VFPA:** Provided Tsleil-Waututh Nation with a copy of the AIMSA, including Appendix 2-B summarised issues raised by Tsleil-Waututh Nation and the VFPA's responses.	**Addressed in AIMSA Appendix 2-B (#5):** This comment was considered and incorporated into the MSA for the three marine mammal sub-components, which are identified as holding important cultural value to Indigenous groups and the public. Indicators selected to determine Project-related changes include those parameters that may cause changes to the acoustic environment, the availability of prey, or water and sediment quality. See the marine mammal assessment of the MSA for more information on behavioural responses. The cultural aspects of any potential effects on marine mammals are assessed in the Current Use assessments in the MSA, and the AIMSA specific to the Tsleil-Waututh Nation.	**EIS** 14.0 Marine Mammals 14.6 Future Conditions with the Project Appendix 14-B Southern Resident Killer Whale Noise Exposure and Acoustic Masking Technical Report **MSA** 8.2 Marine Mammals 8.2.6.2 Potential Effect #1 – Behavioural and Acoustic Masking Effects Due to Underwater Noise from Marine Shipping Associated with the Project **AIMSA** Appendix 2-B Aboriginal Issues and Interests
TWN-14.3	Requested more information on marine mammals, specifically, mitigation for potential Project effects, plans and technical assessments for marine mammals, literature regarding vessel strikes. Requested to participate in VFPA ECHO program for marine mammals.	28-Oct-2014, Aboriginal Group EIS Workshop #3 20-Nov-2014, Health & Aboriginal Rights Workshop –	**28-Oct-2014, Workshop:** Stated that the VFPA has reviewed literature that reports strikes in B.C., and identifies which species are most commonly struck. Stated that with baleen whales it is most commonly fin whales and humpback whales, and sometimes grey whales, but generally it does not occur in the inside waters. Stated that there will be more information about marine mammals in the EIS.	**Addressed in EIS Appendix 7.2-B (#89):** The assessment considers the potential effects on marine mammals of marine vessel traffic associated with Project construction and operation, including the potential for physical disturbance due to a Project-related vessel strike. As described in the EIS, as a result of mitigation measures during construction and operation, no detectable or measurable residual adverse effects from vessel strikes are predicted for marine mammals. The marine mammal assessment considers the potential for cumulative effects with respect to the potential residual effect (i.e., increased underwater noise produced by container ships and support tugs during	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 9.0 Physical Setting 9.8 Underwater Noise 9.8.2 Assessment Purpose and Approach

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
		Tsleil-Waututh Nation	**20-Nov-2014, Workshop:** Referred to the marine mammals VC presentation from fall workshop 3, and recalled that the marine mammal expert presented on expected residual effects and proposed mitigation. Stated that impact from underwater noise is the only predicted residual effect to marine mammals, and therefore the only effect for which mitigation is proposed. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **10-May-2016, Email from the VFPA:** Attached the Enhancing Cetacean Habitat and Observation (ECHO) Program annual report for 2016. The ECHO program is a VFPA-led collaborative initiative aimed at better understanding and managing the cumulative impacts of shipping activities on at-risk whales throughout the southern coast of B.C.	Project operation), in combination with other projects and activities within the RAA, including underwater noise from incremental marine vessel traffic outside VFPA jurisdiction. **Addressed in EIS Appendix 7.2-B (#88):** The methods used to study underwater noise and the results of the assessment of potential underwater noise-related effects on marine mammals are described in the EIS. **Addressed in response to IR4-10:** As noted in the VFPA's response to IR4-10, the VFPA-led ECHO Program is a collaborative initiative aimed at better understanding and managing the impact of shipping activities on at-risk whales throughout the southern coast of B.C. The VFPA-led ECHO Program engages and involves key regional interested parties to maximise program success and help ensure that mitigation and management measures developed through the program are informed by social, cultural, economic, and environmental sustainability interests. The ECHO Program is guided by the advice and input of an advisory working group, and supported by a federal government advisory committee and associated technical committees. Through engagement and consultation with stakeholders, including Indigenous individuals, the ECHO Program has initiated or supported short-term projects, scientific studies, and educational initiatives to fill knowledge gaps necessary to inform the development of credible, science-based threat reduction solutions and management options to reduce cumulative effects of shipping to at-risk whales in the region. Further information about ECHO Program can be found at: https://www.portvancouver.com/environment/water-land-wildlife/echo-program/ **Additional information provided by the VFPA:** The ECHO Program advisory working group brings together a broad spectrum of relevant backgrounds, perspectives and interests from both Canada and the U.S.A., who share the common goal of reducing threats to at-risk whales. The role of the advisory working group is to provide the program management team with timely input, advice, and recommendations during the development and execution of the program's projects and initiatives. With two Indigenous individuals actively participating in the ECHO Advisory Working Group since its inception, the VFPA has worked hard to make sure that Indigenous perspectives are represented in the ECHO Program. Further information about ECHO can be found at: https://www.portvancouver.com/environment/water-land-wildlife/echo-program/	Appendix 9.8-A Construction and Terminal Activity Underwater Noise Modelling Study Appendix 9.8-B Regional Commercial Vessel Traffic Underwater Noise Modelling Study 14.0 Marine Mammals 14.4 Information Sources 14.4.4 Critical Habitat Feature - Acoustic Environment Table 14-7 Marine Mammal Modelling Studies Contributing to Project-related Predictions 14.6 Future Conditions with the Project 14.6.2 Potential Effects of the Project on Southern Resident Killer Whales 14.6.3 Potential Effects of the Project on North Pacific Humpback Whale 14.6.4 Potential Effects of the Project on Steller Sea Lions Table 14-19 Injury and Disturbance Radii for Steller Sea Lions during Impulsive Construction Noise 14.10 Cumulative Effects Assessment **Information Requests** Response to Sufficiency Information Request #10 (IR4-10 of CEAR Document #1051)
TWN-14.4	Stated that the environmental assessment process is not designed to capture or appreciate the deep cultural or spiritual connection past, current and future Tsleil-Waututh Nation members may have with marine mammals, nor does it adequately capture the cultural-ecological significance of marine mammals to the overall health of the Salish Sea, upon which the marine shipping area is imposed.	27-Jun-2016, Email	**27-Jun-2016:** Recorded comment for consideration by the Project team. **30-Sep-2017, Letter from the VFPA:** Provided Tsleil-Waututh Nation with a copy of the AIMSA, including Appendix 2-B summarised issues raised by Tsleil-Waututh Nation and the VFPA's responses.	**Addressed in AIMSA Appendix 2-B (#13):** The MSA was prepared in accordance with the *Updated EIS Guidelines* provided by the CEA Agency. By way of this comment the VFPA notifies the CEA Agency of this concern about the environmental assessment process. **Addressed in AIMSA Section 7.0:** The Current Use assessment in the AIMSA includes a description of the cultural-ecological importance of marine mammals to Tsleil-Waututh Nation.	**AIMSA** Appendix 2-B Aboriginal Issues and Interests 7.0 Current Use of Lands and Resources for Traditional Purposes and Aboriginal and Treaty Rights 7.2.2.1 Marine Resource Use (Marine Mammals) ***Updated EIS Guidelines***

Table 15: Marine Vegetation – Valued Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-15.1	Requested that 'Effects to marshes and eelgrass beds' be changed to read: 'Effects to marshes, eelgrass beds, and enteromorpha species'.	09-May-2014, Letter	**09-May-2014:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 11.0 on Marine Vegetation.	**Addressed in EIS Section 11.0:** This comment was considered and incorporated into EIS Section 11.0 for the eelgrass, intertidal marsh, and macroalgae sub-components. Note that *Ulva*, not Enteromorpha, is the identified green 'sea lettuce' macroalgae at Roberts Bank, and the effects of the Project have been included for these three sub-components, as well as biomat and biofilm.	**EIS** 11.0 Marine Vegetation
TWN-15.2	Requested that 'overall reduction in marine vegetation in the Lower Mainland (cumulative effects)' be added.	09-May-2014, Letter	**09-May-2014:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 11.0 on Marine Vegetation.	**Addressed in EIS Section 11.0:** Describes the cumulative effects assessment for marine vegetation. It was determined that there was no potential for the residual effects of the Project (on biofilm community composition only) to combine with the effects from other reasonably foreseeable projects and activities. No residual adverse effects are anticipated for large vegetation species. A regional effects assessment was not conducted as it was outside of the scope of the assessment, as defined in the *Updated EIS Guidelines* issued by the CEA Agency.	**EIS** 11.0 Marine Vegetation ***Updated EIS Guidelines***
TWN-15.3	Asked if the assessment area for the ecosystem model is larger than the local assessment area for marine vegetation.	28-Oct-2014, Preliminary EIS Workshop #3	**28-Oct-2014, Workshop:** Responded that yes, the ecosystem model extends to -100 m to include other species in the ecosystem that inhabit deeper water. The LAA identified in slide 6 focuses on areas of marine vegetation, to a depth of -40 m. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 10.3 Overview of Assessing Ecosystem Productivity.	**Addressed in EIS Section 10.3:** More information on the ecosystem productivity model can be found in EIS Section 10.3.	**EIS** 10.3 Overview of Assessing Ecosystem Productivity
TWN-15.4	Asked what the plan is for implementing habitat offsetting, including provisions for First Nation participation and input. Stated that First Nations should be at the table for determining offsetting.	20-Nov-2014, Health & Aboriginal Rights Workshop - Tsleil-Waututh Nation	**20-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **30-Aug-2017, Meeting:** The VFPA hosted a Follow-up Program Workshop, and representatives from Tsleil-Waututh Nation attended. The VFPA discussed the Follow-up Program and lessons learned from DP3. The VFPA sought feedback from Tsleil-Waututh Nation on the Follow-up Program and asked what Tsleil-Waututh Nation felt should be considered, what they felt was important to their community and how they would like to be involved going forward.	**Addressed in EIS Appendix 7.2-B (#198):** Onsite habitat is intended to soften the perimeter of the Project's shoreline to be more ecologically representative of the existing estuary, to create similar habitat to those that will be affected by the Project, and to create habitat that generally enhances the productivity of the Roberts Bank ecosystem. The five habitat types considered for onsite offsetting include: • Intertidal marsh: Important for shoreline stabilisation, gas and nutrient regulation, contaminant filtering, and nutrient supply, as well as providing structural habitat used for shelter and food by organisms. Some of the species that use intertidal marsh habitat at Roberts Bank include bivalve shellfish, Dungeness crabs, juvenile Chinook salmon, shiner perch, sand lance, and waterfowl. Approximately 15 hectares of intertidal marsh is proposed along the widened causeway and in the S-bend of the new terminal. • Sandy gravel beach: Provides spawning area for forage fish, including surf smelt, Pacific herring, and sand lance. Two sandy gravel beaches, totalling approximately 4.5 hectares, are proposed along the widened causeway. The beaches are intended to provide attachment-type habitat and substrate suitable for marine vegetation and invertebrates, and to benefit some of their predators (e.g., juvenile Chinook salmon, waterfowl, and American wigeon). • Mudflat: Plays a role in dissipating wave energy and supports large numbers of birds and fish. Mudflats also support biofilm, an important component of the food web in estuarine and coastal ecosystems. Approximately 4.5 hectares of mudflats is proposed along the widened	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 17.0 Mitigation for Marine Biophysical Valued Components 17.3.2 Offsetting Potential Effects, Offsetting Framework

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
				causeway and in the S-Bend of the new terminal. Biofilm, invertebrates, waterfowl, and shorebirds will benefit from this habitat. • Subtidal rock reefs: Support rockfish populations and assist in meeting fisheries management objectives to alleviate historic declines of regional populations. The creation of approximately two hectares of reef habitat will benefit macroalgae vegetation, and provide refuge, feeding, and spawning habitat for invertebrates, fish, and birds. • Eelgrass: Eelgrass beds are highly productive habitats in the Roberts Bank ecosystem, serving numerous critical functions, such as food, shelter, and rearing habitat for numerous species. Approximately three hectares of native eelgrass will be established through transplants in the inter-causeway area. The onsite habitat concepts presented in EIS Section 17.0 have been presented to Indigenous groups, the community, stakeholders, and the public in open houses and small group meetings that took place in the fall of 2014. The feedback received from Indigenous groups has been considered in the finalisation of the EIS. **Additional information provided by the VFPA:** The offsetting framework presented in EIS Section 17.3.2 provides an outline to facilitate the development of a detailed Offsetting Plan that will be required for the Project's *Fisheries Act* Authorization. Once finalised, the Offsetting Plan will include Project-specific provisions for addressing serious harm to a commercial, recreational, or Aboriginal fishery. It will be developed in accordance with the *Fisheries Productivity Investment Policy: A Proponent's Guide to Offsetting* and will incorporate proven measures to minimise Project-related effects to productivity. The VFPA will consult with potentially-affected Indigenous groups as part of the application for *Fisheries Act* Authorization.	
TWN-15.5	Asked if the VFPA has ever conducted eelgrass transplants before. Asked if someone can speak to the challenging nature of eelgrass transplants. Requested a backup plan if eelgrass transplants prove unsuccessful as a mitigation measure. Asked how work related to eelgrass transplants has been going. Stated that Tsleil-Waututh Nation would like to see a net gain of eelgrass habitat. Concerned that eelgrass transplant work would involve use of fill from the Fraser River dredging program, around which there are possible contamination concerns. Concerned that there are no separate eelgrass studies	07-Oct-2014, Preliminary EIS Workshop #1 28-Oct-2014, Preliminary EIS Workshop #3 20-Nov-2014, Health and Aboriginal Rights Workshop – Tsleil-Waututh Nation 15-Jun-2015, Letter to the CEA Agency (CEAR Document #249) 08-Jun-2016, Meeting 03-Aug-2016, Issues Workshop - Tsleil-Waututh Nation, Métis Nation British Columbia, and	**07-Oct-2014, Workshop:** The Project team working on the eelgrass assessment has a lot of experience doing this in the Lower Mainland. Until 1986 there were a lot of challenges, but since then transplants have had a success rate of over 90%. Therefore, the Project team is confident in their ability to carry out eelgrass transplants successfully. The primary challenge with regard to eelgrass transplants in the Project area has to do with keeping divers in place while working in high current conditions—not the eelgrass itself. **28-Oct-2014, Workshop:** Replied that the team is working with a well-known eelgrass expert, who has been involved in all of the eelgrass transplants in this area over the past 20 years. She has helped with the Project studies and there is full confidence in her and her abilities to do this work. **20-Nov-2014, Workshop:** Success is well documented, and was referenced in the first workshop. Stated that there is information available from DP3 explaining what did and did not work well, and that knowledge has been incorporated into proposed mitigation concepts for the Project. **01-Apr-2015, Letter from the VFPA:**	**Addressed in EIS Appendix 7.2-B (#201) and EIS Section 17.0:** Onsite eelgrass habitat creation is proposed through transplanting in an area approximating 3 ha. Based on the review of previous habitat creation programs (e.g., DP3), eelgrass transplants are considered to be an effective means of increasing productivity of marine vegetation. The VFPA will implement a Follow-up Program, which will include monitoring to confirm that all offsetting measures meet intended objectives and function as designed. Monitoring will include methods and success measures to confirm that offsetting measures have been effective. The *Fisheries Act* Authorisation will require that functional objectives are met. **Additional information provided by the VFPA:** The placement of fill for the construction of sub-tidal eelgrass habitat will be subject to environmental regulations that establish the guidelines for this fill material. The source of fill material for this work has not been selected at this time but measures will be implemented to ensure that the fill material meets these regulatory guidelines.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 17.0 Mitigation for Marine Biophysical Valued Components 17.3.2 Offsetting Potential Effects, Offsetting Framework 17.6 Mitigation for Marine Biophysical Valued Components, Monitoring and Reporting

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
	included in the EIS or its appendices. Stated that much of the basis of mitigations proposed for marine vegetation, marine fish, marine invertebrates, coastal birds, and Southern Resident Killer Whales depends entirely on the success of eelgrass transplanting. Stated that eelgrass studies therefore must be included in the EIS, and this data incorporated into the assessment.	Semiahmoo First Nation	Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **13-Oct-2015, Letter from the CEA Agency (CEAR Document #313):** *"The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."* **30-Apr-2016:** Tsleil-Waututh Nation was invited to an eelgrass transplanting workshop at the VFPA office, but Tsleil-Waututh Nation was unable to attend. **08-Jun-2016, Meeting:** Explained the proposed eelgrass mitigation related to RBT2 and Habitat enhancement Program (HEP). HEP Tsawwassen Eelgrass Project is one example and offered to provide additional information. Undertook to share information on the eelgrass workshop as well as anything on transplant methodology etc. **20-Jun-2016:** Uploaded information related to eelgrass transplants on an ftp site for Tsleil-Waututh Nation's review, including: • Eelgrass Presentation from the April 30, 2016 Knowledge Sharing Workshop; • Eelgrass Display Board/Fact Sheet; • June 2015 Tsawwassen Eelgrass Project Update (we anticipate sending a new update for this project in the next couple of weeks); and • April 2016 RBT2 On-Site Mitigation Information Sheet. The VFPA will follow-up to see if there is interest in scheduling a meeting or workshop to discuss. **03-Aug-2016, Workshop:** There are two projects involving eelgrass transplant. One is the Project-specific onsite mitigation, and the other is HEP - the Tsawwassen Eelgrass Project, which falls under the VFPA. The Tsawwassen Eelgrass Project will potentially be constructed in 2017, pending confirmation of a B.C. EAO exemption. [Post-meeting note: The Tsawwassen Eelgrass Project is not projected to be constructed until 2019+]. It is expected that the geomorphic conditions associated with the Project will enhance favourable conditions for eelgrass. Onsite offsetting in the form of transplants is also proposed, not because eelgrass needs to be offset itself, but because of the importance of eelgrass to other species, like crab and clams. Those onsite offsetting measures proposed in the EIS are not in the works yet. Onsite mitigation will be built as part of the construction of the Project; no work would start before shovels are being put in the ground.		

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
			Offered to have a focused discussion with Tsleil-Waututh Nation specific to eelgrass transplants both Project-specific and related to the HEP. Note: Discussions are ongoing. **10-May-2018:** At the request of Tsleil-Waututh Nation, the VFPA held a meeting with Tsleil-Waututh Nation and others regarding eelgrass transplanting and donor site selection in relation to the proposed Maplewood Marine Restoration Project in Burrard Inlet.		
TWN-15.6	Concerned that eelgrass transplants will be taken from sites in the Burrard inlet, and that this might threaten the viability of the species.	08-Jun-2016, Meeting	**08-Jun-2016, Meeting:** Stated that it is unlikely that donor sites will be located in the Burrard Inlet, but donor sites will be discussed with Tsleil-Waututh Nation.	**Additional information provided by the VFPA:** The VFPA has been working with Tsleil-Waututh Nation with respect to eelgrass transplants and donor sites within the context of the proposed Maplewood Marine Restoration Project, located in Burrard Inlet, and held a workshop with Tsleil-Waututh Nation and their technical experts, along with VFPA representatives and eelgrass experts on May 10, 2018. The objective of this workshop was to enhance the VFPA's understanding of existing eelgrass donor sites within and outside of Burrard Inlet. This information will be shared where appropriate with the RBT2 Project team and with Indigenous groups participating in the Centerm Expansion Project, Maplewood Marine Restoration Project ,or other relevant HEP projects. With respect to any eelgrass transplantation associated with the RBT2 Project, the selection of donor sites will be determined through consultation with the Tsleil-Waututh Nation and other interested Indigenous groups.	

Table 16: Mitigation for Marine Biophysical Valued Components (including Onsite Habitat Concepts)

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-16.1	Asked whether proposed mitigation measures (such as for underwater noise) would have an element of monitoring to them.	03-Aug-2016, Issues Workshop - Tsleil-Waututh Nation, Métis Nation British Columbia, and Semiahmoo First Nation	**03-Aug-2016, Workshop:** Stated that with regard to construction compliance monitoring, hydrophone technology will be used to monitor underwater noise. **30-Aug-2017, Meeting:** The VFPA hosted a Follow-up Program Workshop, and representatives from Tsleil-Waututh Nation attended. The VFPA discussed the Follow-up Program and lessons learned from DP3. The VFPA sought feedback from Tsleil-Waututh Nation on the Follow-up Program and asked what Tsleil-Waututh Nation felt should be considered, what they felt was important to their community and how they would like to be involved going forward.	**Addressed in EIS Section 33.3.1:** The Construction Compliance Monitoring Plan will describe the environmental compliance monitoring and reporting framework for the Project's construction phase. The purpose of compliance monitoring is to verify compliance with the terms and conditions of Project approval and other legislation, industry standards, regulatory requirements, and with the other sub-plans of the Construction EMP. As such, the Construction Compliance Monitoring Plan will describe monitoring parameters and requirements for all other plans in the Construction EMP. As appropriate, the plan will make use of the VFPA's existing monitoring equipment at and around Roberts Bank (e.g., for noise and air quality). The plan will outline the approach to be taken with respect to the scope of compliance monitoring activities to be undertaken by the construction Environmental Monitors, including routine compliance-checking of measurable parameters, including underwater noise.	**EIS** 33.3.1 Construction Compliance Monitoring Plan
TWN-16.2	Asked if crab salvage is an effective mitigation measure. Asked whether it works to pick them up, move them, and have them stay put.	03-Aug-2016, Issues Workshop - Tsleil-Waututh Nation, Métis Nation British Columbia, and Semiahmoo First Nation	**03-Aug-2016, Workshop:** Stated that crabs may not stay put, but they may not re-enter the Project area. Stated that the plan would be to keep them at Roberts Bank; they would not be moved really far afield. Stated that this mitigation was implemented for DP3 and seemed to work pretty well. Crabs have been tracked to travel up to 2 km a day, but typically a lot less. If moved five or six hundred metres away they likely will not be impacted by dredging.	**Addressed in response to IR-7.31.15-12:** As noted in the VFPA's response to IR-7.31.15-12, crab salvages are expected to be partially effective for mitigating effects to crabs. Salvages are a proven approach at Roberts Bank for DP3, but salvages are known to only reduce and not fully mitigate construction-related crab productivity decreases. **Addressed in response to IR5-04:** As noted in the VFPA's response to IR5-04, salvages are planned for all Project activities that have the potential to cause direct mortality to legal-sized male and gravid female Dungeness crabs. A list and schedule of proposed Project activities is provided in Table IR5-04-1; the activities for which Dungeness crab mortality or injury may occur are indicated, and for those activities that may cause mortality or injury, plans for salvages are also indicated. Given the nature of direct mortality effects, mitigation options are limited, and crab salvage is the only viable and feasible mitigation. Salvages were conducted to meet the conditions of the *Fisheries Act* Authorization for DP3. Cutter suction dredging was preceded by ongoing crab salvages (where baited traps were set in advance of dredging and crabs relocated approximately 2 km from the project area) and a visual dive survey (where divers provided visual confirmation of no crabs prior to initial dredging) (Hemmera 2009). In the case of clamshell dredging, visual inspections of the collected dredgeate were made by the contractor's crews and the environmental monitor; only one crab was identified within the dredgeate during the entire project (Hemmera 2009), underscoring the effectiveness of this measure. In consultation with Indigenous groups, the VFPA has heard a suggestion to bait outside the Project area to draw crabs away as opposed to baiting within the Project area and relocating them. The VFPA is currently exploring this option and will determine an appropriate approach to this mitigation method through engagement with relevant regulatory agencies, stakeholders, and Indigenous groups.	**Information Requests** Response to Information Request #12 (IR-7.31.15-12 of CEAR Document #314) Response to Sufficiency Information Request #4 (IR5-04 of CEAR Document #1209)

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-16.3	Stated that in Volume 3, Section 17.3, Offsetting Potential Effects and Appendix 7.2-B ID 28, Tsleil-Waututh is highly concerned with the VFPA's proposed mitigations that involve offsetting effects. Stated that without understanding how the habitat was evaluated, the timeframe for evaluation, and the details of the 'banking system', Tsleil-Waututh cannot agree that this is an environmentally responsible way to address project effects. Concerned with the Habitat Enhancement Program and requested to be involved in decision-making when projects are being evaluated as debits or credits in the system.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #249)	**13-Oct-2015, Letter from the CEA Agency (CEAR Document #313):** *"The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review".*	**Addressed in EIS Section 17.0:** EIS Section 17.0 presents a description of the Project's mitigation framework, which includes the offsetting component. As noted in the section, a detailed offsetting plan will be developed through discussions with regulatory agencies as part of the environmental assessment and permitting process. **Additional information from the VFPA:** As part of the VFPA's approach to environmental stewardship and sustainability, we have been proactively enhancing local habitat for more than 20 years. Since 1991, the VFPA has been creating, restoring, and enhancing fish and wildlife habitat—including salt water marshes, intertidal marshes, and eelgrass beds—to help maintain a balance between a healthy environment and future development that may be required for port operations. HEP, which was formalised through a 2012 Working Agreement with DFO, improves the VFPA's ability to offset potential impacts of development. The program consists of projects around the Lower Mainland, through which the VFPA ensures the viability and sustainability of new and enhanced habitat. Further information concerning HEP is available at: https://www.portvancouver.com/environment/water-land-wildlife/habitat-enhancement/.	**EIS** 17.0 Mitigation Framework for Marine Biophysical Valued Components

Table 17: Port Operations

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-17.1	Asked where ships currently re-fuel in the VFPA's jurisdiction.	22-Oct-2013, Meeting	**22-Oct-2013, Meeting:** Responded that the VFPA will check where the fuelling and bunkering occurs and will get back to Tsleil-Waututh Nation with information. **06-Jan-2014, Letter from the VFPA:** Container ships cannot re-fuel at Roberts Bank as facilities to support bunkering of ships do not exist at Roberts Bank, nor does the Project include any facilities to support bunkering. Container ships are on a tight schedule and will arrange to pick up fuel at a location where they will be at berth for a longer time (home port) and where fuel is less expensive, usually in Asia. Vessels within the VFPA's jurisdiction that need to re-fuel will typically take on fuel in Burrard Inlet, alongside at berth, or at one of the designated anchorages in the inlet. The fuel is delivered to the vessels by barge, either from the Stanovan Marine Terminal (Chevron) in Burnaby or the Shellburn Marine Terminal (Shell Canada), also in Burnaby. Tugs that guide the container ships during arrival and departure, bunker at the Chevron marine fuelling station in Burrard inlet.		
TWN-17.2	Asked for more details on ship anchorage locations.	22-Oct-2013, Meeting	**22-Oct-2013, Meeting:** Responded that there are no anchorages at Roberts Bank. Container ships are scheduled. There are no unexpected arrivals at the Port.	**Addressed in response to IR5-01:** The VFPA's response to IR5-01 discusses anchorages, as well as average anchorage durations. Existing anchorage locations are provided in a map in Transport Canada Appendix C Figure 1 of CEAR Document #982, along with very detailed information regarding anchorages in its response to Panel information request TC IR-07. As part of this response, Appendix C (Pacific Pilotage Authority Marine Shipping Area Anchorage Locations and Specifications) provided the longitudinal and latitude coordinates for all anchorages along with the associated maps for the anchorages outside of VFPA jurisdiction. In addition, use durations of noted anchorages are provided.	**Information Requests** Response to Sufficiency Information Request #01 (IR5-01 of CEAR Document #1078) **Transport Canada Response to TC IR-07 (CEAR Document #982)**

Table 18: Potential Accidents or Malfunctions

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-18.1	Stated that the VFPA should conduct a risk assessment on vessel safety as part of the EIS.	22-Oct-2013, Meeting	**22-Oct-2013, Meeting:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#204):** Potential spills of deleterious materials (e.g., hydrocarbons) and their environmental effects are discussed in the EIS. Plausible worst-case scenarios involving a marine vessel, motor vehicle, and train accident, each assumed to result in a spill of deleterious materials, are assessed. The regulatory management framework, standard practices, and Project-specific measures to reduce the risk of accidents or malfunctions, including spills, as well as the emergency response and mitigation measures to be implemented in the event of a spill are described. Three worst-case scenarios involving hydrocarbon spills were assessed: a container ship impact incident at the terminal, a tanker truck accident on Roberts Bank Way North, and a yard locomotive derailment on the widened causeway. The assessment determined that a ship impact scenario involving a marine spill of heavy fuel oil at the terminal would result in adverse residual effects to all marine biophysical VCs, as well as marine commercial use, outdoor recreation, and land and water use. While the residual effects on southern resident killer whales, coastal birds, and Current Use were considered significant, due to the extremely low probability of such a scenario, all residual effects were considered unlikely. Since the diesel spill in each of the land-based scenarios would occur away from the marine environment, no potential interactions with marine biophysical VCs were identified. Further, no residual adverse effects were identified with respect to socio-economic VCs, including services and infrastructure and human health. As with any activity, the potential for unplanned incidents during Project construction and operation exists. The VFPA, its tenants, contractors, operators, and intermodal partners are committed to continue to improve port-wide operational practices and procedures to ensure the safety of workers and the public, and protection of the environment. The composition and number of hazardous goods containers handled at Deltaport Terminal in 2012 was reviewed during the development of the Quantitative Risk Assessment (see Table B-4 (Appendix B) of EIS Appendix 30-A). The estimated probability and potential consequences of a range of accidents or malfunctions, including spills of deleterious materials from ships during Project construction and operation, are described in the EIS. **Addressed in the MSA Section 10.0:** Several independent studies informed the accidents and malfunctions assessment presented in the MSA, including a quantitative risk assessment that estimated probabilities for different types of potential marine vessel accidents from a container ship in transit in MSA Appendix 10-A.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 30.0 Potential Accidents or Malfunctions Appendix 30-A Marine Vessel Incidence Prediction Inputs to the Quantitative Risk Assessment Appendix 30-A Marine Vessel Incidence Prediction Inputs to the Quantitative Risk Assessment Appendix B – Tables **MSA** Appendix 10-A Marine Vessel Incidence Prediction Inputs to the Quantitative Risk Assessment
TWN-18.2	Stated that an increased number of larger ships due to the Project will detrimentally affect the safe travel and navigation of smaller vessels (e.g. crabbing and fishing vessels) in the local study area, shipping channels and the Fraser River. Stated that navigating the landscape and sharing stories is a primary context for Coast Salish cultural transmission.	20-Nov-2014, Health & Aboriginal Rights Workshop - Tsleil-Waututh Nation	**22-Nov-2014, Workshop:** Vessel safety will be addressed through discussions with other agencies and groups, and procedures to address vessel safety will be implemented. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#169):** The assessment of Current Use includes the potential effects of the Project on the ability of Indigenous groups to access and use preferred harvesting areas. A quantitative risk assessment was conducted to determine the risk of potential accidents related to small vessels (EIS Section 30.0). **Addressed in EIS Section 32.2.7.1:** The combination of the existing accommodation agreement with Tsawwassen First Nation, the planned accommodation agreement with Musqueam First Nation, the measures to limit potential displacement-related effects to crab harvesting (including those set out in EIS Sections 21.0 and 24.0), and the VFPA's support of Indigenous domestic and FSC crab harvesting within the planned extension navigational closure area are expected to be effective at addressing Project-related effects to Current Use access related to crab harvesting. For Project-related effects on marine access for other Current Use purposes,	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 25.0 Visual Resources 26.0 Land and Water Use 27.0 Human Health 28.0 Archaeological and Heritage Resources 30.0 Potential Accidents and Malfunctions

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
				the measures set out in EIS Section 26.0 and the communications protocol and mechanism identified above are expected to be effective at addressing planned and unforeseen events that may interfere with that access. The residual effect on access to preferred Current Use locations as a result of the Project is therefore predicted to be negligible. **Addressed in EIS Section 32.2.7.4:** In combination with the measures to reduce Project-related effects on Current Use access and Current Use resources, the measures identified in EIS Sections 25.0, 27.0, and 28.0 are also expected to be effective at addressing adverse effects on the quality of the Current Use experience that may relate to Project-related changes in sense of place, light, noise, vibration, and air emissions, and cultural heritage and transmission. The VFPA recognises that the quality of Current Use experience is community-specific, and expects the communications mechanism identified in EIS Section 32.2.7.1 to support dialogue between the VFPA and appropriate Indigenous groups on topics of concern, including safety issues, will augment the effectiveness of the other measures identified to address community-specific concerns related to the quality of the Current Use experience. The residual effect on the quality of Current Use experience as a result of the Project is therefore predicted to be negligible. **Addressed in MSA Section 10.0:** The assessment of potential accidents or malfunctions (MSA Section 10.0) includes consideration of a plausible worst-case collision scenario between a container ship and a smaller vessel such as a fishing vessel. Potential effects of such an event are assessed for the following VCs: marine commercial use, outdoor recreation, and human health, as well as Current Use. The plausible worst-case collision scenario has the potential to result in measurable residual adverse effects on human health, marine commercial use, outdoor recreation, Current Use, and asserted or established Aboriginal and treaty rights. The assessment concluded that residual adverse effects are expected to be not significant for marine commercial use and outdoor recreation, but significant for human health. For Current Use, the residual effect could range from not significant to significant, depending on the capacity of the affected Indigenous group to continue to undertake Current Use. In the event of a collision between a vessel engaged in traditional use activities and a container ship, a minor to serious adverse residual impact on the ability of the affected Indigenous group to exercise Aboriginal and treaty rights associated with those activities would be expected. In all cases, the identified residual adverse effects of a collision are unlikely to occur, because of the very low probability of collision. MSA Section 9.5 considers cultural practices, such as the acquisition of traditional foods and the transmission of traditional knowledge. Perceptions of safety, as well as access to preferred harvesting locations and visual or auditory disturbances, are covered in the assessment of potential changes to the following: access to preferred Current Use locations and quality of Current Use experience. **Addressed in AIMSA Appendix 2-B (#5):** The assessment of Current Use considers the risk of collision and perceptions of safety associated with routine Project-associated vessel transit. The assessment of potential accidents or malfunctions includes consideration of a collision scenario between a container ship and a smaller vessel such as a fishing vessel. Potential effects of such an event are assessed for marine commercial use, outdoor recreation, and human health VCs and Current Use and rights. In terms of Current Use and rights discussed in the AIMSA, the analysis and conclusions presented in MSA Section 10.5.13 remain unchanged and are viewed as fully applicable to Tsleil-Waututh Nation in the event their Current Use or the exercise of their asserted or established Aboriginal rights were to be affected by a collision incident, should it occur in the context of marine shipping associated with the Project.	Appendix 30-A Marine Vessel Incidence Prediction Inputs to the Quantitative Risk Assessment 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Lands and Resources for Traditional Purposes 32.2.7.1 Mitigation Measure #1: Changes in Access to Preferred Current Use Locations 33.0 Environmental Management Program **MSA** 10.0 Potential Accidents and Malfunctions 10.5.13 Current Use of Lands and Resources for Traditional Purposes and Aboriginal and Treaty Rights **AIMSA** 7.0 Current Use of Lands and Resources for Traditional Purposes and Aboriginal and Treaty Rights 8.0 Potential Accidents or Malfunctions 8.5 Current Use of Lands and Resources for Traditional Purposes and Aboriginal and Treaty Rights

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-19.1	Stated that Tsleil-Waututh does not think it is necessary to describe the location of the main reserve in relation to the Project. Please delete "approximately 35 km from the Project area" from the first sentence in Paragraph 1 and second sentence in Paragraph 2.	14-Aug-2014, Letter	**25-Mar-2015, Letter from the VFPA:** Revision made.		
TWN-19.2	Stated that the traditional territory description provided for Tsleil-Waututh Nation is inaccurate. In the first sentence, please delete "includes the Lower Fraser River and Mamquam Lake, near the District of Squamish, BC" and change it to: "The Tsleil-Waututh Nation's asserted traditional territory extends approximately from the vicinity of Mount Garibaldi in the north, the 49th parallel and beyond to the south, west towards Gibsons, and east towards Coquitlam Lake."	14-Aug-2014, Letter	**25-Mar-2015, Letter from the VFPA:** Revision made.		
TWN-19.3	Requested that the VFPA delete "part of the Salishan" and "linguistic group" from the first sentence so it is changed to: "The Tsleil-Waututh people are Coast Salish and speak a dialect of Halkomelem called Hun'qumyi'num." Stated that the correct reference for the Tsleil-Waututh Stewardship Policy is (Tsleil-Waututh Nation 2009).	14-Aug-2014, Letter	**25-Mar-2015, Letter from the VFPA:** Revision made.		
TWN-19.4	Tsleil-Waututh requests that "co-management" is added to the last sentence of Paragraph 5 so, it is changed to: "Outside of the treaty process, Tsleil-Waututh Nation has formal agreements with provincial ministries and the District of North Vancouver relating to co-management and resource use within their asserted traditional territory."	14-Aug-2014, Letter	**25-Mar-2015, Letter from the VFPA:** Revision made with edits (see italicised text). "Outside of the treaty process, Tsleil-Waututh Nation *states they have* formal agreements with provincial ministries and the District of North Vancouver relating to co-management and resource use within their asserted traditional territory."		
TWN-19.5	Stated that Tsleil-Waututh Nation's traditional territory is incorrectly portrayed in the EIS; this is the Statement of Intent Boundary and should only be used for treaty purposes. Requested that the black dashed boundary identified as "Tsleil-Waututh Nation Asserted Traditional Territory" be removed, as it does not reflect Tsleil-Waututh Nation's traditional territory but the Statement of Intent (SOI) map, which is only to be used for treaty purposes. All maps, references and interpretations of the Tsleil-Waututh's SOI are to be removed from the EIS. Stated that the Statement of Intent (SOI) is not appropriate to include in any aspect of the EIS as it is only for treaty purposes.	14-Aug-2014, Letter 20-Nov-2014, Health & Aboriginal Rights Workshop – Tsleil-Waututh Nation 15-Jan-2015, Letter 15-Jun-2015, Letter to the CEA Agency (CEAR	**20-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **25-Mar-2015, Letter from the VFPA:** "The EIS Guidelines specifically require 'a map of [Tsleil-Waututh Nation]'s asserted traditional territory.' Unless it is withdrawn, the SOI is by definition [Tsleil-Waututh Nation]'s asserted traditional territory, therefore is required to be included in the EIS. Both the SOI and Consultation Area will be shown on Figure 3-3 and 32-4 [of the EIS]." **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#181):** The *EIS Guidelines* (section 9.2) specifically require "a map of [Tsleil-Waututh Nation]'s asserted traditional territory." Unless it is withdrawn, the SOI is by definition Tsleil-Waututh Nation's asserted traditional territory, therefore is required to be included in the EIS. Both the SOI and Consultation Area were shown on EIS Figures 3-3 and 32-4. **Addressed in response to IR-7.31.15-02:** The VFPA provided, in July 2014, maps of each traditional territory, where asserted or established, to the applicable Indigenous group, along with a community profile, for review and comment. In November and December 2014, the VFPA provided each Indigenous group with the summary of existing conditions for that Indigenous group presented in EIS Section 32.2.4, and requested that each Indigenous group review and comment on that summary.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes ***Updated EIS Guidelines*** **Information Requests** Response to Information Request #2 (IR-7.31.15-02 of CEAR Document #314)

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
		Document #249)	**13-Oct-2015, Letter from the CEA Agency (CEAR Document #313):** *"The Agency has requested additional information on this item in its letter of July 31, 2015 to [the VFPA] (page 1, #2). Additionally, Tsleil-Waututh is welcome to provide the appropriate information in this regard directly to the Panel Secretariat at RobertsBank@ceaa-acee.gc.ca. This will ensure that the Panel, once appointed, has the appropriate information."*	In the case of Tsleil-Waututh Nation, the Statement of Intent map, which Tsleil-Waututh Nation had asked to be removed from EIS Figure 32-4, was retained, as was the Consultation Area, which was used as the basis of assessment for Tsleil-Waututh Nation.	
TWN-19.6	Stated that the BC EAO and VFPA (2012) report referenced [in presentation on Tsleil-Waututh Nation rights and Current Use] is inadequate and requested that it not be considered. Offered to provide a detailed critique of the report. Stated that the Application for the YVR Fuel Delivery Project is listed as an information source on Tsleil-Waututh use of lands and resources for traditional purposes. Stated that that information source is problematic and inaccurate. Advised strongly against using it as a resource on Tsleil-Waututh. Requested that the VFPA review Tsleil-Waututh Nation's rebuttal to the "Application for an EAC by Vancouver Fuel Facilities" for the Vancouver Airport (YVR) Fuel Delivery Project in its research for the EIS.	20-Nov-2014, Health & Aboriginal Rights Workshop - Tsleil-Waututh Nation 15-Jan-2015, Letter	**25-Mar-2015, Letter from the VFPA:** *"Rebuttal has been reviewed. The "EAO and VFPA 2012" citation has been removed from the [Tsleil-Waututh Nation] section, and replaced with [Tsleil-Waututh Nation] 2012, which is the rebuttal document. No changes to the text were necessary."*		
TWN-19.7	Requested that the VFPA remove all references that pertain to Tsleil-Waututh regarding the Trans Mountain Pipeline Assessment. Stated that the use of this resource is also incredibly problematic.	15-Jan-2015, Letter	**25-Mar-2015, Letter from the VFPA:** *"Concern noted. The Trans Mountain Pipeline reference has only been used for other groups, some of whom provided [the VFPA] with material prepared in the context of the Trans Mountain proposal."*		
TWN-19.8	Stated that given the accurate published information that pertains to Tsleil-Waututh, it is disappointing that, aside from our Knowledge Study, accurate ethnographic sources are largely absent from the VFPA's draft EIS for RBT2, yet secondary, inaccurate project reports are cited. Stated that to ensure robust and accurate research, Tsleil-Waututh Nation staff provided a list of accurate references on Tsleil-Waututh to the VFPA through email communications on 19-Dec-2014.	15-Jan-2015, Letter	**25-Mar-2015, Letter from the VFPA:** *"A thorough statement about the objectives of the past /historical information included in [EIS] Section 32.0 is provided in the second to last paragraph in the introductory section of Existing Conditions (32.2.4). It is assumed that the Knowledge Study provided by [Tsleil-Waututh Nation] best reflects information of import to the [Tsleil-Waututh Nation]."*		
TWN-19.9	Stated that Section 32 of the EIS falls short of describing the innate values that Tsleil-Waututh works to protect every day from a Tsleil-Waututh perspective, specifically culture.	15-Jan-2015, Letter	**25-Mar-2015, Letter from the VFPA:** *"Text added to the Other Cultural Considerations section of [EIS] Section 32.2.4.4."* **01-Apr-2015, Letter from the VFPA:**	**Addressed in EIS Section 32.2.4.4:** Tsleil-Waututh have described culture as a fluid value that is experienced in many different ways, and is not limited to specific activities, locations, or points in time. This value, Tsleil-Waututh	**EIS** 32.2 Current Use of Land and Resources for Traditional Purposes

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
	Stated that culture is a fluid value Tsleil-Waututh experiences in many different ways, and it is not limited to specific activities, locations, or points in time. Tsleil-Waututh culture includes but also transcends these elements described in this draft EIS section. The values of Tsleil-Waututh are alive through the Tsleil-Waututh people and community, and are recognized, protected, and upheld through the Treaty, Lands and Resources Department and many other departments that the Tsleil-Waututh Nation governs. Culture is a way of living and a way of protecting Tsleil-Waututh way of life.		Provided a copy of the EIS, which included EIS Section 32.2.4.4 on Tsleil-Waututh Nation.	has explained, is lived through Tsleil-Waututh people and community, and is recognised, protected, and upheld through the nation's governance (Tsleil-Waututh Nation 2015).	32.2.4.4 Tsleil-Waututh Nation
TWN-19.10	Asked how 'Current Use' is defined throughout the assessment; does it include the goals of Tsleil-Waututh Nation for species restoration, and future use. Stated that Tsleil-Waututh Nation would like to protect future harvesting interests for sturgeon, eulachon, herring and other forage fish, and crab. Stated that the Current Use of Lands and Resources for Traditional Purposes effects assessment does not take into account the Aboriginal right to future and desired use. Stated that the assessment does not fully capture Aboriginal interests, and Project and related impacts to those interests. Stated that Tsleil-Waututh would like to work with the Proponent to incorporate this Information as it pertains to Tsleil-Waututh Nation. Requested that Tsleil-Waututh Nation review the Current Use and Rights sections.	03-Jul-2014, Preliminary EIS Workshop #1 07-Oct-2014, Valued Components Workshop #1 20-Nov-2014, Health & Aboriginal Rights Workshop – Tsleil-Waututh Nation 15-Jan-2015, Letter 18-Dec-2015, Letter to the CEA Agency (CEAR Document #379)	**03-Jul-2014, Workshop:** Stated that the intent is to include Indigenous input for Current Use and other potential impacts on Aboriginal rights and other interests' sections. **14-Jul-2014, Email from the VFPA:** Shared with Tsleil-Waututh Nation the VFPA's draft Tsleil-Waututh Nation community profile. The VFPA sought feedback on draft. **07-Oct-2014, Workshop:** Stated that the methodology for assessing potential adverse Project effects on Current Use is very similar to that for VCs and ICs. Noted that people have had input on that to-date, and if there is additional input going forward, the VFPA would be happy to take that, and it is why we are here. For both sections, the methodology and rationale for how we reached the conclusions will be presented in the EIS. **20-Nov-2014, Workshop:** Stated that Current Use is not defined by the CEA Agency in the *EIS Guidelines*. It is required that effects to Current Use be determined separately from impacts to Rights. Stated that where Tsleil-Waututh Nation has a desired use, the VFPA encourages Tsleil-Waututh Nation to provide that information so that it can be considered. Stated that desired uses have been brought up in today's meeting and can now be incorporated into the assessment. **09-Dec-2014, Email from the VFPA:** Provided Tsleil-Waututh Nation with the VFPA's draft attached sections "Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current Use of Lands and Resources for Traditional Purposes" (with accompanying map) and "Aboriginal Commercial Fishing and Seafood Harvesting" for review and comment.	**Addressed in EIS Appendix 7.2-B (#174):** The methods used to assess the potential effects of the Project on Current Use are consistent with existing federal guidance, including the *EIS Guidelines* issued by the CEA Agency. The rationale for the determination of negligible residual effects to Current Use is included in the EIS. Information sources used in EIS Section 32.0 are listed in EIS Section 32.2.3, with Project-specific studies appearing in EIS Section 32.2.3.1. A full list of references cited appears in EIS Section 32.4.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
			15-Jan-2015, Letter from Tsleil-Waututh Nation: Tsleil-Waututh Nation provided a list of requests regarding the draft EIS sections. **25-Mar-2015, Letter from the VFPA:** Provided a comment tracking table with comments provided by Tsleil-Waututh Nation, the response provided by the VFPA, and a description of any subsequent changes made to these documents. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **12-May-2016, Letter from the CEA Agency (CEAR Document #399):** *"The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review.* *The Crown will be using the Review Panel process to the extent possible to collect information about potential impacts to the exercise of Tsleil-Waututh Nation's rights from the Project and marine shipping associated with the Project and we encourage you to provide your 'perspective on this topic to the Review Panel."*		
TWN-19.11	Interested in the Aboriginal Rights and Interests section: • Asked if the methodology for VCs is different from the assessment on asserted or established Aboriginal and treaty rights and related interests, and current use. • Asked if there was a significance rating. • Asked if First Nations' input on methodology will be incorporated.	07-Oct-2014, Preliminary EIS Workshop #1	**07-Oct-2014, Workshop:** The VFPA explained that the assessment of potential effects on Current Use generally followed the same methods used in the VC assessments given statutory requirements under *CEAA, 2012*, but that there were key differences for the assessment of potential adverse impacts on asserted and established Aboriginal and treaty rights. The VFPA stated that, for example, significance would need to be determined when looking at potential effects on Current Use, if a residual effect on Current Use was predicted; however, the VFPA is not required to make a determination of significance with respect to potential impacts on asserted and established Aboriginal and treaty rights. The VFPA noted that while the VFPA is required to make a significance determination, the final decision on that determination rests with the federal government. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#26):** The methods used to assess potential effects of the Project on the ability of Indigenous groups to exercise Current Use, and potential impacts on Aboriginal and treaty rights and related interests are described in the EIS. Because residual Project-related effects on Current Use were predicted to be negligible, further assessment, including a determination of significance, was not conducted. A significance determination was not made with respect to potential impacts on Aboriginal and treaty rights. **Additional information provided by the VFPA:** The VFPA sought input from Indigenous groups on the methods for the assessment of potential effects on Current Use and potential impacts on the exercise of Aboriginal and treaty rights prior to submission of the EIS, and incorporated that input, where appropriate (there was very little input on methods received at that time). The VFPA is aware that the CEA Agency has proposed methods for the assessment of potential adverse impacts on the exercise of Aboriginal and treaty rights, and that the CEA Agency has been seeking input from Indigenous groups on those methods.	**EIS** 8.0 Effects Assessment Methods 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-19.12	Disagreed with the finding that the Project is not expected to result in adverse effects to Tsleil-Waututh Nation Current Use, or adversely impact Tsleil-Waututh Nation asserted rights and related interests, or result in detectable effects to Tsleil-Waututh Nation access to the Project area for Current Use. Stated that Tsleil-Waututh Nation believes there is an adverse effect from the Project to Tsleil-Waututh Nation's right to self-governance and making management decisions about its territory.	20-Nov-2014, Health & Aboriginal Rights Workshop - Tsleil-Waututh Nation	**20-Nov-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#174):** The methods used to assess the potential effects of the Project on Current Use are consistent with existing federal guidance, including the *EIS Guidelines* issued by the CEA Agency. The rationale for the determination of negligible residual effects to Current Use is included in the EIS. Information sources used in EIS Section 32.0 are listed in EIS Section 32.2.3, with Project-specific studies appearing in EIS Section 32.2.3.1. A full list of references cited appears in EIS Section 32.4.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes
TWN-19.13	Stated that in Volume 5, Section 32 and Appendix 7.2-B ID 26, Tsleil-Waututh does not agree that project related effects on current use of lands and resources for traditional purposes are deemed to be negligible. Stated that it is premature to make this conclusion. This conclusion can only be made when the effects of the project are known.	15-Jun-2015, Letter to the CEA Agency (CEAR Document #249)	**13-Oct-2015, Letter from the CEA Agency (CEAR Document #313):** *"The Agency did not request additional information from [the VFPA] on this item. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	**Additional information provided by the VFPA:** As a result of extensive studies and assessment, the VFPA is confident potential adverse effects can be fully or partially avoided or reduced through Project design and the implementation of environmental management programs. Where Project-related effects cannot be fully avoided or reduced, offsetting measures, such as the creation and enhancement of habitat, will be applied. A robust monitoring and follow-up program will be implemented to assess the effectiveness of mitigation measures. **Addressed in EIS Section 33.5:** Similar to the AMS for DP3, as described in EIS Section 33.5, the VFPA is committed to developing and implementing a Follow-up Program for the Project. The purpose of the Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project. To ensure the Program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the EIS. The Follow-up Program will include: • An evaluation of the adequacy of existing data to provide a benchmark against which to test Project-related effects; • A monitoring design drawing on the measurable parameters identified to be field-tested; • A methodological approach for using field-collected data to measure and verify the accuracy of the effects predicted in the EIS; • A reporting framework that defines frequency of reporting, distribution and feedback mechanisms; and • Details of the VFPA's approach to adaptive management for the Project through construction and operation. The Follow-up Program will be developed in consultation with federal agencies, including the CEA Agency, DFO, and ECCC. Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on the program and approving agencies have an	**EIS** 33.5 Follow-Up Program

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
				opportunity to evaluate and approve the program. Feedback from Indigenous groups regarding the draft program will be sought through the VFPA's ongoing engagement initiatives. The Follow-up Program will also report on implementation of mitigation measures resulting from Indigenous engagement, which will include the following: • Verification of predictions of environmental effects with respect to Indigenous people, as well as residual effects that could not be addressed within the context of the environmental assessment; • Determination of the effectiveness of mitigation measures as they relate to environmental effects with respect to Indigenous people; • Support for the implementation of adaptive management measures to address previously unanticipated adverse environmental effects with respect to Indigenous people, or unanticipated adverse effects to Aboriginal or treaty rights; • Verification of the measures identified to prevent and mitigate potential adverse effects of the Project on potential or established Aboriginal rights; and • Provision of information that can be used to improve and support future environmental assessments and Indigenous engagement processes.	

Table 20: Project Overview and Description

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-20.1	Asked about the rationale for the Project, and economic factors related to trade through the gateway.	08-Jun-2016, Meeting	**08-Jun-2016, Meeting:** Committed to send more information on the topics. **17-Jun-2016, Email from the VFPA:** A report prepared by Ocean Shipping Consultants provides more information on the competitive landscape of Pacific Northwest ports and impact of any infrastructure improvements that are planned or underway. The report provides an overview of current and planned capabilities, as well as forward-looking, competitive outlook of Pacific Northwest terminals, including those in Seattle, Tacoma, Portland, Vancouver, and Prince Rupert. The report is available at the following link: http://www.robertsbankterminal2.com/wp-content/uploads/Port-Metro-Vancouver-Container-Traffic-Forecast-Ocean-Shipping-Consultants-June-2014.pdf.	**Additional information provided by the VFPA:** All levels of government have plans to capitalise on a growing global economy, which requires Canada to be prepared for the trade that will come to Canadian ports. At the Port of Vancouver, we handled a record 3.25 million twenty-foot equivalent unit (TEU) containers in 2017. Historical trade figures and third-party forecasts have long signalled that the ability of west coast ports to serve this growth is becoming constrained, and by the mid-2020s we will not have the capacity to handle anticipated future growth of trade in containers at the Port of Vancouver. The role of the VFPA is to ensure the port is ready for Canada's trading future. As we plan, we must consider how to provide needed port facilities within a growing metropolitan area. To date, we have partnered with industry, governments, and communities to improve road and rail networks, investing to help goods flow smoothly throughout our region. We have also consulted with local governments, Indigenous groups, and residents on the ways we can grow responsibly. Investments in increased size and improved efficiency are being, or have been, made to west coast container terminals, including recent improvements at the Port of Vancouver's Deltaport, Canada's largest container terminal, and Fairview in Prince Rupert. However, even with these investments, we will not have enough space to accommodate the shortfall in needed capacity. The RBT2 Project represents the best option to accommodate growth and is needed to deliver the capacity we need as demand for goods shipped in containers continue to grow. Independent container capacity forecasts Since 2011, the port authority has commissioned independent forecasts which consider many factors that influence container traffic demand, including: • Gross Domestic Product growth; • World demand for Canadian resources; • Increased consumer demand for trade with Asia; • Opening of the expanded Panama Canal; • Planned container terminal expansion at the Port of Prince Rupert; • Macroeconomic trends in North America; • North American container port demand and competitive developments; • Trends in container shipping; and • Vancouver's competitive position compared to other North American ports. The 2016 Ocean Shipping Consultants forecast shows continued growth in container trade through the west coast of Canada at a compound annual growth rate of about 4%, and reinforces the need for planned increases of capacity to ship goods in containers through the existing container terminals in Vancouver and the Fairview Terminal in Prince Rupert.	Roberts Bank Terminal 2 Project, Meeting Canada's Trade Demand, Project Rationale http://www.robertsbankterminal2.com/wp-content/uploads/RBT2-Project-Rationale-March-20151.pdf Ocean Shipping Consultants 2016 Container Traffic Forecast Report http://www.robertsbankterminal2.com/wp-content/uploads/2016-Ocean-Shipping-Consultants-Container-Forecast.pdf

Table 21: Project Benefits

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-21.1	Stated that there is an interest in benefitting socially and economically from the Project, including revenue sharing, employment (specifically, long-term skilled positions), contracting and training. Directed the VFPA to Tsleil-Waututh Nation's economic development department, community development departments, and economic development business Inlailawatash to discuss opportunities. Stated that in Volume 1, Section 7.7.2.5. Summary of Aboriginal Group Issues and Interests, the effects to revenue sharing is excluded. This issue was raised by Tsleil-Waututh in meetings and in writing to the VFPA, but is not acknowledged in this section. Stated that the economic benefits described in Appendix Table 7-2B (10 112) do not capture opportunities for Tsleil-Waututh Nation. Cowichan Nation's request for revenue sharing is indicated here, but not Tsleil-Waututh's. Interested in economic benefits.	20-Nov-2014, Health & Aboriginal Rights Workshop – Tsleil-Waututh Nation 15-Jun-2015, Letter to the CEA Agency (CEAR Document #249) 08-Jun-2016, Meeting with Tsleil-Waututh Nation Economic Development	**20-Nov-2014, Workshop:** Recorded Tsleil-Waututh Nation's interests. Stated that the first opportunities for employment and contracting from the Project would be construction-related, which would still be a few years off, but the VFPA would like to get the conversation started early. Committed to following up with Tsleil-Waututh Nation's economic development department to discuss opportunities further. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **13-Oct-2015, Letter from the CEA Agency (CEAR Document #313):** *"The Agency did not request additional information from [the VFPA] on this item. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."* **08-Jun-2016, Meeting:** Team members from the VFPA met with representatives from Tsleil-Waututh Nation Economic Development to share information about opportunities related to RBT2, HEP, and Centerm Expansion Project (CEP). Stated that more information would be coming on contracting, employment, and other benefits. **10-May-2017, Letter from the VFPA:** Expressed the VFPA's interest in meeting with Tsleil-Waututh Nation to discuss: • Proposed RBT2 legacy benefits for Indigenous groups; and • Entering into a RBT2 Project Mutual Benefits Agreement. Stated that it is the VFPA's understanding that it is Tsleil-Waututh Nation's preference to wait until the environmental assessment process is further along before engaging in discussions related to both the RBT2 Indigenous group legacy benefits and a RBT2 Mutual Benefits Agreement. Requested confirmation that the VFPA has correctly understood Tsleil-Waututh Nation's preference in relation to these two opportunities. **17-Apr-2018, Email from the VFPA:** Reiterated interest in commencing RBT2 Mutual Benefits Agreement negotiations with Tsleil-Waututh Nation. **11-Jul-2018, Email from the VFPA:** Followed up regarding Tsleil-Waututh Nation's interest in beginning negotiations for a Mutual Benefits Agreement.	**Addressed in EIS Appendix 7.2-B (#215):** The VFPA proposes to assist Semiahmoo First Nation, Tsleil-Waututh Nation, Stz'uminus First Nation, Cowichan Tribes, Halalt First Nation, Lake Cowichan First Nation, Lyackson First Nation, Penelakut Tribes, Hwlitsum, and Métis Nation British Columbia in accessing potential economic opportunities resulting from the Project, including contracting opportunities as well as construction employment opportunities. To support these Indigenous groups in preparing for employment opportunities, the VFPA will provide training funding and undertake specific job-related information sharing activities, such as job fairs. To support the development and implementation of plans to facilitate access to such Project-related benefits, the VFPA will continue engagement, initiated in December 2014. Opportunities for Indigenous training and employment opportunities related to the Project are described in EIS Section 32.3.3.	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 20.0 Economic Development 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.3.3 Mitigation Measures 35.0 Effects Assessment Summaries Table 35-2 Proposed Mitigation Measures and Commitments

Table 22: Surficial Geology and Marine Sediment – Intermediate Component

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-22.1	Requested more information on the Maintenance Dredging Plan.	28-Oct-2014, Preliminary EIS Workshop #3	**28-Oct-2014, Workshop:** Stated that at this point, there is very limited information. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Section 4.4.2.5 Maintenance Activities.	**Addressed in EIS Section 4.0:** Information can be found in EIS Section 4.0. Maintenance dredging has not been required to date for the existing Roberts Bank terminals; consequently, it is expected that the Project will require limited or no maintenance dredging at the marine approach areas, berth pocket, and tug basin.	**EIS** 4.0 Project Description 4.4.2.5 Maintenance Activities

Table 23: Traffic / Transportation

#	Interest / Concern Raised	Date(s) / Method(s) Raised	Response	Additional Information	Document and Section providing Additional Information
TWN-23.1	Asked how road traffic will be assessed and considered as part of the human health assessment.	08-Oct-2014, Preliminary EIS Results Workshop #2	**08-Oct-2014, Workshop:** Responded that traffic is not a VC in this assessment, but effects related to traffic are covered through the noise and vibration, air quality, and health assessments. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#220):** The EIS considers the effects of incremental truck traffic within VFPA jurisdiction. The economic development assessment (EIS Section 20.0) considers economic effects in Metro Vancouver and B.C. related to an increase in trucking activity related to the Project. Environmental and social effects associated with Project-related increases in truck traffic on the causeway are considered in the EIS assessments of air quality (EIS Section 9.2) noise and vibration (EIS Section 9.3), services and infrastructure (EIS Section 23.0), human health (EIS Section 27.0), and Current Use (EIS Section 32.2). The EIS also considers the potential cumulative effects of the Project in combination with other projects and activities, including existing and incremental road, rail, and marine vessel traffic. Note the VFPA issued a revised version of EIS Section 27.0 and EIS Appendix 27-B (see CEAR Document #412).	**EIS** Appendix 7.2-B Aboriginal Issues and Interests 8.0 Effects Assessment Methods Appendix 8-A Valued Component Selection Rationale 9.2 Air Quality 9.3 Noise and Vibration 27.0 Human Health

TWN-24.1	Requested that native plant species be planted along the causeway to partially mitigate visual impacts from the Project.	08-Oct-2014, Preliminary EIS Results Workshop	**08-Oct-2014, Workshop:** Stated that a vegetation buffer would only deal with visual effects along the causeway. **01-Apr-2015, Letter from the VFPA:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#124):** The use of a vegetation buffer along the causeway as a proposed mitigation measure for effects on daytime visual resources was excluded from further assessment after consideration of feedback received during consultation with Indigenous groups, as well as inter-disciplinary input on technical feasibility. It was concluded that a vegetation buffer would have limited, if any, effectiveness as mitigation for adverse effects on visual resources, and could result in a predation risk to shorebirds from raptors. Moreover, past experience with a vegetation buffer on the causeway have been unsuccessful due to soil conditions.	**EIS** 25.0 Visual Resources 25.7 Mitigation Measures
TWN-24.2	Asked whether there are possibilities for visual resources mitigations offsite. Suggested Aboriginal art installations at the BC Ferries terminal.	08-Oct-2014, Preliminary EIS Results Workshop #2	**08-Oct-2014, Workshop:** Stated that offsetting visual impacts is an interesting suggestion, which will be taken back. The BC Ferries causeway is outside the VFPA's jurisdiction.	**Additional information provided by the VFPA:** This suggestion is being considered as opportunities for cultural recognition on the Project and may be an opportunity pursued through the Aboriginal Legacy Benefits Program.	

APPENDIX IR10-01-C5

STZ'UMINUS FIRST NATION: ISSUES, VIEWS, AND CONCERNS RELATED TO THE PROPOSED PROJECT AND MARINE SHIPPING ASSOCIATED WITH THE PROJECT

Stz'uminus First Nation

Table 1: Air Quality – Intermediate Component

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-1.1	Asked for clarification on the assertion that air quality is expected to improve while climate emissions increase. Requested additional information on the new air emission standards.	22-Oct-2014, Cowichan Nation Alliance EIS Workshop #1	**22-Oct-2014, Workshop:** Responded that air quality improves with a decrease in emissions for criteria air contaminants as well as for some traces in organic compounds. Greenhouse gas emissions will be higher in terms of global emissions, so that is what is meant by an improvement in air quality as well as an increase in climate emissions. There will be decreases in emissions both overall and on a per-truck basis because of new, more stringent emission standards for on-road vehicles. The assessment only considers emission reduction measures that have been confirmed. There may well be additional reduction measures in the future that would further contribute to lowering emissions. Future reductions in emissions can be estimated based on expected equipment turnover. The Vancouver Fraser Port Authority's (VFPA) truck licensing system restricts the engine age and emissions standards of vehicles that are allowed to enter VFPA terminals. By 2015, all trucks that access VFPA marine terminals will be required to achieve a 2007 engine emission performance or better. The International Maritime Organization (IMO) is implementing the North American Emission Control Area (ECA), which will be coming into effect in January 2015, requiring the sulphur content in fuel to be no higher than 0.1% for vessels.	**Addressed in EIS Section 9.2.7.1:** Regulatory initiatives for air quality and their incorporation into the assessment of future emissions are described in EIS Section 9.2.7.1. **Addressed in EIS Appendix 7.2-B (#42):** An assessment was carried out to predict potential changes in air quality as a result of Roberts Bank Terminal 2 (RBT2 or Project). The results of the air quality assessment were used in the assessments of human health and current use of land and resources for traditional purposes (Current Use). The assessment modelled Project-related fuel combustion and fugitive dust emission sources during the construction phase, and fuel combustion emission sources during the operation phases, and compared future conditions with the Project to modelled existing conditions and future expected conditions. Existing conditions considered emissions from marine vessels, trains, trucks, vehicles, and cargo handling equipment from the existing Westshore Terminals, Deltaport Terminal, and BC Ferries Terminal, while emissions from industrial, commercial, and residential sources within Delta were represented through measured air quality levels in Tsawwassen. A general trend of decreasing concentrations of contaminants has been observed and is expected to continue in the Lower Fraser Valley for some criteria air contaminants, as well as for some trace organic contaminants. Predicted maximum concentrations were used to conservatively estimate existing conditions and potential changes from the Project. Estimated emissions and predicted ambient concentrations did not account for the inclusion of shore power as part of the Project, which is expected to decrease future emissions from ships at berth, ultimately improving future air quality compared to predicted concentrations. The predicted concentrations also did not account for the switch to the use of liquefied natural gas (LNG) fuel for ferry vessels at the BC Ferries Terminal. The assessment concludes that: • Air quality in the region will improve in the future, with or without the Project, as a result of improvements in engine technologies as older equipment is replaced by newer equipment at the three existing marine terminals, and the use of cleaner fuels. • Cumulative changes, incorporating the Project and other certain and reasonably foreseeable projects and activities, are predicted to be small relative to expected improvements in future ambient air quality levels. • Project construction activities are predicted to cause a small increase in concentrations of some contaminants, but will be mitigated through the use of emission reduction measures to limit fugitive dust emissions and a monitoring program to guide construction activity in the event that ambient air concentration exceed defined criteria threshold levels. • Criteria air contaminant (i.e., carbon monoxide, nitrogen oxides, sulphur dioxide, particulate matter, and ground-level ozone) and trace organic contaminants (i.e., formaldehyde and other contaminants related to fuel combustion) levels are predicted to be below ambient air quality criteria on land, with limited exceptions. The exceptions for predicted nitrogen dioxide levels near the causeway are considered to be an artificially caused by the conservative methods used in the air quality assessment, and are not expected to actually exceed established ambient air quality criteria. • The Project is expected to have a negligible effect on future ozone levels. • Although Project activities would emit black carbon, black carbon is expected to decrease in the future with the Project due to equipment fleet turnover at existing Roberts Bank terminals to newer engines that meet more stringent emission standards for particulate matter.	**Environmental Impact Statement (EIS, CEAR Document #181)** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 9.0 Physical Setting 9.2 Air Quality 9.2.5 Methods Appendix 9.2-A Air Quality Study Main Report Appendix A - Emissions Inventory Appendix B – Existing Air Quality Appendix C - Air Dispersion Modelling Appendix F - Ships Underway 9.2.6 Existing Conditions Table 9.2-4 Air Quality Criteria for Criteria Air Contaminants Table 9.2-5 Air Quality Criteria for Toxic Organic Contaminants 9.2.7 Expected Conditions 9.2.7.1 Regulatory Initiatives 9.2.8 Future Conditions with the Project 9.2.9 Future Conditions with the Project and Other Projects and Activities Appendix 9.2-A Air Quality Study Appendix H – Westshore Coal Dust Assessment

Stz'uminus First Nation

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
				The Project is not expected to result in any significant adverse effect on human health, including from changes in air quality because air quality is expected to improve. The benefits of existing emission reduction initiatives are realised in the existing emissions monitored at local air quality stations in Metro Vancouver. Future benefits to air quality, such as improvements in engine technology and fuel quality, are described based on their anticipated level of benefit to future air quality emissions, in EIS Section 9.2.7. Through its ongoing Air Action Program*, the VFPA is constantly looking at addressing air quality and climate change, by focusing on the use of technologies and the promotion of operational efficiencies to reduce air emissions from port operations, such as those mitigation measures suggested during consultation. Key components of the Air Action Program include the EcoAction Program, the Northwest Ports Clean Air Strategy, the Landside Air Emissions Inventory, and environmental requirements through the Truck Licensing Program. Information regarding the VFPA's Air Action Program can be found at http://www.portmetrovancouver.com/en/environment/initiatives/Air.aspx. *The Air Action program was renamed to Air, Energy and Climate Action. As part of the Deltaport Third Berth Project (DP3), the VFPA funded the establishment of the Tsawwassen Air Quality Monitoring Station. The location of the station, at Pebble Hill Reservoir located at 411 Milsom Wynd in Delta, was chosen by the Delta Air Quality Monitoring Technical Working Group (composed of representatives from Corporation of Delta, Environment Canada, Metro Vancouver, Tsawwassen First Nation, and the VFPA). The station is comprised of state-of-the-art monitoring equipment including ozone and particulate monitoring technologies. Since this station is part of Metro Vancouver's regional air quality monitoring network, results from the station can be viewed in real-time at www.bcairquality.ca/readings. **Additional information provided by the VFPA:** The analysis of the data from this station indicates that there has been a reduction in both sulphur dioxide (SO_2) and fine particulate matter ($PM_{2.5}$) concentrations measured at this monitoring station after the implementation of the requirements for low sulphur fuels from ships under ECA regulations. For 2010, the levels of carbon monoxide, SO_2, $PM_{2.5}$, and ground-level ozone meet the most stringent of Canadian, provincial, and regional ambient air quality standards or objectives. **Additional response provided by the VFPA:** During operation, Project-related exposures to air emissions are not predicted to result in measurable health effects. During construction, a moderate health effect is predicted for a small area over water between the Westshore and RBT2 terminals, where public access is not likely. Therefore, health effects during construction are unlikely to occur. Air quality will be monitored during construction and operation, and there would be adaptive measures should Project emissions result in exceedance of ambient air quality objectives/criteria.	

Stz'uminus First Nation

Table 2: Alternative Means of Carrying out the Project

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-2.1	Asked about the process of determining whether the Project is feasible, and whether the decision was made based on only economic and technical factors, or if environmental or cultural impacts were considered.	22-Oct-2014, Cowichan Nation Alliance EIS Workshop #1	**22-Oct-2014, Workshop:** Responded that in going through the process of selecting the Project location and design, the VFPA has considered environmental effects throughout the design process, and many changes have been made along the way. Stated that the design that has been selected is conceivably acceptable to environmental regulators. Stated that the Panel will determine whether the effects of the Project can be mitigated sufficiently.	**Addressed in EIS Appendix 7.2-B (#2):** The VFPA's approach for identifying and selecting alternatives was undertaken internally. As part of this process, the VFPA reviewed and considered Indigenous input provided as part of the environmental assessment processes for prior projects at Roberts Bank. Alternatives to the Project are described in EIS Section 5.0. The VFPA considered the following alternatives for creating container capacity to meet the forecasted demand, both within and outside of its jurisdiction: • Incremental capacity and efficiency increases are underway or in planning at Deltaport Terminal and Centerm. These projects will help meet short-term container demand to the early 2020s, but would not meet forecasted longer-term requirements. • Lease tenures on properties adjacent to the Vanterm property will persist until at least the late 2020s, and converting them to containers would displace other trade-related activities. If improvements at Vanterm were feasible, expansion would not be anticipated until sometime after 2030, and therefore would not meet the need to deliver additional container capacity required by the mid-2020s. • Larger container ships, such as those visiting Deltaport Terminal, Centerm, and Vanterm, cannot be accommodated in the Fraser River channel due to draught requirements and length (ability to turn around in the river). Fraser Surrey Docks is not expected to be a major source of container capacity to meet demand beyond 2018. • Conversion of the Lynnterm terminal to handle containers is not technically or financially feasible, due to road constraints and conflict with current handling operations. • Development of the VFPA's Fraser Richmond properties to provide large-scale container capacity is not technically feasible due to road and rail capacity constraints and issues with larger container ships in the Fraser River channel. • Planned expansions at the Fairview Terminal in Prince Rupert will help meet short-term west coast container demand to the early 2020s, but will not meet forecasted longer-term requirements. The results of the VFPA's analysis concludes that the Project is the only technically and financially feasible option to meet long-term demand for container capacity on Canada's west coast. Feasibility of the Project will also be determined by the outcome of the environmental assessment process, and the decisions by provincial and federal ministers of the environment. **Addressed in response to IR1-06:** Technical feasibility criteria used to evaluate alternatives to the location, orientation, layout and configuration of the marine terminal at Roberts Bank was based on whether potential environmental effects were deemed to be acceptable by regulators. Generally, alternatives located in subtidal habitat (i.e., deeper waters) were considered favourable as the potential for environmental effects in shallower, intertidal waters would increase the potential for effects to marine invertebrate and fish habitats, and pose a risk to obtaining the permits required for the Project (i.e., Fisheries Act Authorization). Economic feasibility criteria considered construction costs and schedule (including dredge, fill, and soil improvement requirements), as well as operational costs associated with downtime from weather/navigation constraints, yard efficiencies, and maintenance dredging. Options W1 and W2 of the terminal, located west of the existing Roberts Bank terminals were considered to be technically and economically feasible (Table IR1-06-2). An assessment of environmental effects of these alternatives is provided in the VFPA's response to IR1-07.	**EIS** 5.0 Alternative Means of Carrying out the Project 5.3.1 Increase Capacity and Efficiency of Existing Container Terminals within VFPA Jurisdiction 7.0 Engagement and Consultation 7.2.1 Aboriginal Groups Engagement and Consultation, Engagement and Consultation Process Overview Appendix 7.2-B Aboriginal Groups Issues and Interests Table **Information Requests** Response to Sufficiency Information Request #06 (IR1-06 of CEAR Document #897) Response to Sufficiency Information Request #07 (IR1-07 of CEAR Document #897)

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-2.2	Requested additional information and asked about the Port Alberni Trans-shipment Hub concept.	22-Oct-2014, Cowichan Nation Alliance EIS Workshop #1	**22-Oct-2014, Workshop:** Responded that the Port Alberni Port Authority has put forth a proposal that would see the creation of a transshipment container terminal where containers would be [barged to Vancouver and]unloaded from vessels and transferred to barges for shipping. From there the containers would be unloaded from the barges at a terminal and transferred for intermodal transport by truck and rail. It is a concept that has been publicly presented, but its current status is uncertain with respect to economic viability and willingness-interest from industry; it would require a major shift in the way containers are handled on the west coast of North America, [and would still require additional terminal capacity in Vancouver].		**EIS** 5.0 Alternative Means of Carrying out the Project 5.3 Location of Marine Terminal within British Columbia Alternatives Appendix 7.2-B Aboriginal Groups Issues and Interests Table

Table 3: Archaeological and Heritage Resources – Valued Component

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-3.1	Requested more information on beach weirs and historic tidal channels. Concerned that the Archaeological Overview Assessment only considers fish weirs for sturgeon and does not consider other types (i.e., salmon).	22-Oct-2014, Cowichan Nation Alliance EIS Workshop #1	**22-Oct-2014, Workshop:** Recorded comment for consideration by Project team. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#154):** Ethnographic information including Indigenous Traditional Knowledge (ITK) suggests that salmon were traditionally caught using methods other than those using wooden stakes. These methods, trawl nets and harpooning, are not likely to have left archaeological evidence if they were used. The potential effects are to "fish trap stakes" in general and consider other species of fish in addition to sturgeon (i.e., salmon).	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 28.0 Archaeological and Heritage Resources 28.5.1.2 Ethnography
STZ-3.2	Concerned about the exclusion of Cowichan Nation Alliance member nations from the scope of the Archaeological Overview Assessment.	04-Mar-2014, Letter to the VFPA from Cowichan Tribes on behalf of Cowichan Nation Alliance 22-Oct-2014, Cowichan Nation Alliance EIS Workshop #1	**04-Mar-2014:** Recorded comment for consideration by the Project team. **06-May-2014, Letter from the VFPA to the Cowichan Nation Alliance:** Stated that the purpose of the Archaeological Overview Assessment is not to provide a detailed ethnographic history, but an ethnographic overview of the study area. However, the ethnography section has been revised and also includes a listing of all First Nations that have a potential claim to the study area, according to GeoBC's Consultative Areas Database. The Cowichan Nation Alliance provided the Brealey report to the VFPA in confidence. The VFPA requested permission from the Cowichan Nation Alliance to provide the report to Millennia Research Limited but was denied. Therefore, this information is not included in the Archaeological Overview Assessment. **22-Oct-2014, Workshop:** Stated that Tsawwassen First Nation, Musqueam First Nation, and Hwlitsum provided the VFPA with information about fish weir use on the intertidal flat and that this preliminary assessment was written before more recent information had been received. The VFPA has read the report prepared by Dr. Kennedy and submitted by the Cowichan Nation Alliance regarding historical use, and recalled that information about Halalt use of traps for salmon was provided. The VFPA apologised that information is not reflected in the presentation, and explained this presentation had been prepared prior to reading the report. The scope of the Archaeological Overview Assessment is not meant to cover proof of claim. There is a section covering Current Use that includes a very comprehensive discussion of the interests and use of the Cowichan Nation Alliance, which is much broader than this assessment, which considers the potential physical disturbance of archaeological sites. The VFPA committed to take the feedback and information shared and provide it to the teams working on the assessment and writing the reports.	**Addressed in EIS Appendix 7.2-B (#151):** The purpose of the archaeological and heritage resources assessment was to determine whether there is potential for archaeological and heritage resources to exist in the assessment area, and to determine any Project-related effects on these resources, if they are present. The assessment was supported by an Archaeology Overview Assessment, which included an ethnographic overview of the area and a review of the potential for undocumented heritage sites to exist in the local assessment area (LAA). The results of the archaeological and heritage resources assessment were considered in EIS Section 32.0. The LAA included the physical footprint of the Project plus a 100 m buffer zone, as well as a zone of coastal-geomorphological influence. The regional assessment area (RAA) considered a four kilometre (km) area around the Project area. No archaeological sites were identified in the LAA, either using the B.C. Archaeology Branch's online heritage registry or through the Archaeological Overview Assessment. If archaeological or historical materials remain in the intertidal area, it is likely that they have been preserved in the sediment layers, if not affected by previous construction. The Project may affect archaeological resources, namely, fish trap stakes, if present in the Project area. Direct effects could result from Project-related construction activities, and indirect effects could result from changes to sediment deposition or erosion. Through mitigation, including excavation of test trenches prior to construction activities and the implementation of an Archaeological Monitoring and Management Plan, potential damage to archaeological resources would be avoided and the opportunity for future archaeological study would be protected. The Project is not expected to result in significant residual effects to archaeological and heritage resources. The Project is not expected to result in any incremental cumulative effects to archaeological and heritage resources. A description of the past use of the Roberts Bank area by Indigenous groups is provided in EIS Section 32.0. The presentation of information on past use of the area in the assessment of archaeological and heritage resources is tailored to those Indigenous groups whose past uses are directly linked to the type of physical archaeological resources that have the potential to be present in the study area, and have the potential to be affected by the Project. The scope or methods of the archaeological and heritage resources assessment are described in EIS Section 28.0.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 28.0 Archaeological and Heritage Resources 28.2 Selection of Archaeological and Heritage Resources VC 28.3 Assessment Boundaries 28.4 Information Sources 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Land and Resources for Traditional Purposes

Table 4: Coastal Birds – Valued Component

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-4.1	Asked whether there is potential for wildlife to confuse day for night due to lights.	22-Oct-2014, Cowichan Nation Alliance EIS Workshop #1	**22-Oct-2014, Workshop:** Stated that this was considered for birds, and more information would be provided in a later presentation on light. **12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2:** Presented on coastal birds, stating that effects from disturbance (noise, light, vessel movement) can be effectively mitigated. Presented mitigations measures to address lighting impacts, valances to minimise light trespass. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#45):** The potential changes in light that may be caused by the Project, and the potential effects of those changes on valued components (VCs) and on Current Use are considered in the EIS. The results of the light assessment informed the assessments of marine fish, coastal birds, visual resources, and human health, and Current Use. The assessment focused on two aspects of light: • Light trespass, the amount of light that strays from its intended purpose onto neighbouring areas; and • Sky glow, the unwanted illumination of the night sky that affects the visibility of stars. The assessment concluded that: • Overall, the Project is not expected to change the general light environment of the Lower Mainland and the Gulf Islands and no measurable incremental cumulative changes related to light are expected. • Project-related lighting is expected to result in a minimal increase in light trespass levels. • Increases in sky glow levels are expected, but are not anticipated to result in a noticeable change from existing conditions. Suggested mitigations were considered in the effects assessment. Mitigation measures to address effects on visual resources and coastal birds consist of implementation of Environmental Management Plans, including Light Management Plans, for construction and operation phases. The Light Management Plans will describe measures to reduce excess lighting and sky glow, including: • Orienting lights downwards and away from residential and marine areas; • Using shielding to minimise light trespass; • Controlling light levels and limiting light use to areas where activities are occurring; • Where possible, using fixtures that emit light at wavelengths shown to minimise disorienting effects to birds; • During construction, ensuring dredge lighting system shields light from spilling outside the basic working footprint of the dredge; and • During operation, establishing a centralised lighting control system to select lighting where required. **Addressed in EIS Appendix 7.2-B (#99):** A review of documented effects of both natural and artificial light on birds is provided in EIS Section 15.7.2.1. The EIS considers the potential effects of artificial light on coastal birds, including the potential for increased risk of predation on shorebirds by nocturnal raptors (i.e., owls). Overall, the Project is not expected to compromise the productive potential of the local area to support coastal bird productivity, or change to species' viability. The assessment concludes there are no significant adverse residual effects from the Project to coastal birds. The Project is not expected to result in measurable incremental adverse cumulative effects to coastal birds. **Addressed in MSA Section 8.3:** Potential effects of artificial light from shipping traffic in the marine shipping area. The MSA notes that nocturnal feeding marine birds can be attracted to artificial light sources, such as ship lighting, and that mortality is known to occur. For the LAA, no collisions with vessels have been recorded, which indicates that collisions with vessels are most likely infrequent and, if they do occur, do so on a small scale (in terms of the number of birds).	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 9.0 Physical Setting 9.4 Light 9.4.4 Relevant Guidelines 13.0 Marine Fish 13.6.3 Future Conditions with the Project, Potential Effect - Changes in Productivity, 13.7.5 Mitigation Measures, Mitigation #4 for Changes in the Light Environment 15.0 Coastal Birds 15.7.2.1 Mechanisms Affecting Productivity 25.0 Visual Resources 25.7.2 Mitigation Measures, Mitigation Measure #2 – Lighting Design and Operation – Light Management Plans 27.0 Human Health 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes 33.3.5 Construction EMP, Light Management Plan 33.4.3 Operation EMP, Light Management Plan **Marine Shipping Addendum (MSA, CEAR Document #316)** 8.3 Coastal Birds **Information Requests** Response to Sufficiency Information Request #02 (IR9-02)

Stz'uminus First Nation

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
				Addressed in response to IR9-02: The VFPA's forthcoming response to IR9-02, as requested by the Review Panel, will further discuss mitigation measures related to artificial light for migratory and non-migratory birds and avian species.	
STZ-4.2	Asked if Tundra and Trumpeter Swans use the Project area, and whether or not they were considered in the assessment. Added that swans were historically numerous, then disappeared.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014, Workshop:** Responded that swans have been in the area, and that long-term use of that area by the species is understood.	**Addressed in EIS Appendix 7.2-B (#93):** The Fraser River estuary is an important area to many coastal birds because of the abundant food sources. The Roberts Bank area supports an abundance and diversity of bird species. An assessment was undertaken to determine the effects of the Project on coastal birds. The assessment of coastal birds focused on seven sub-components: • Shorebirds, represented by Pacific dunlin and western sandpiper; • Waterfowl, represented by American wigeon and brant (which is a proxy for swans); • Herons, represented by great blue heron; • Diving birds, represented by surf scoter and western grebe; • Raptors, represented by bald eagle, barn owl and peregrine falcon; • Gulls and terns, represented by Caspian tern and glaucous-winged gull; and • Passerines, also known as songbirds, represented by barn swallow. The use of the Fraser River estuary and the Project area by trumpeter swan and tundra swan is described in the EIS, under the waterfowl section (EIS Section 15.5.4). Overall, the Project is not expected to compromise the productive potential of the local area to support coastal bird productivity, or change to species' viability. The assessment concludes there are no significant adverse residual effects from the Project to coastal birds. The Project is not expected to result in measurable incremental adverse cumulative effects to coastal birds.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 15.0 Coastal Birds 15.2 Selection of Coastal Birds Valued Component 15.5.4 Existing Conditions, Waterfowl 15.7.2 Future Conditions with the Project, Potential Effect – Changes in Productivity Appendix 15-B Shorebird Foraging Opportunity during Migration Appendix 15-C Overwintering Dunlin Foraging Opportunity
STZ-4.3	Asked why humans had not been considered in the Shorebird Opportunity Model.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014, Workshop:** Responded that interactions are addressed separately in the EIS. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Section 15.0:** The focus of the Shorebird Opportunity Model (EIS Appendix 15-B) was on shorebird access to food sources and the capacity of the LAA to support existing and future shorebird populations (with the project). Although humans may interact with shorebirds, the food resources upon which shorebirds depend are largely in the intertidal zone where the potential for shorebird-human interactions are minimal.	**EIS** 15.0 Coastal Birds 15.2 Selection of Coastal Birds Valued Component 15.5.4 Existing Conditions, Waterfowl 15.7.2 Future Conditions with the Project, Potential Effect – Changes in Productivity Appendix 15-B Shorebird Foraging Opportunity during Migration Appendix 15-C Overwintering Dunlin Foraging Opportunity

Table 5: Coastal Geomorphology – Intermediate Component

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-5.1	Stated that elders in 1990 asked for flow to be maintained through the causeway. Commented that sand appears to have accumulated on the north side of the causeway. Asked about the long-term environmental impacts of the existing causeway.	01-Nov-2013, Meeting with Cowichan Nation Alliance 22-Oct-2014, Cowichan Nation Alliance EIS Workshop #1	**01-Nov-2013, Meeting:** Responded that work completed by a coastal geomorphologist and by a fisheries biologist determined that by breaching the causeway more damage would be done. Responded that work was completed to look at flow through the causeway and it was determined that while it was conceptually okay, in practice it would create a bigger issue (i.e., it would remove the mudflat if you removed the causeway). The reason why the terminal is situated further out from the mudflats is because building a terminal near the mudflat would have a negative impact. The further out the terminal is built, the less impact to the mudflat. **22-Oct-2014, Workshop:** Presented information on coastal geomorphology, including the existing conditions and the anticipated future changes as a result of the Project.	**Additional information provided by the VFPA:** An independent technical study, "Potential Effects of Opening the Causeway," was undertaken for the Vancouver Port Authority in 2005 to clarify issues related to physical processes and hydraulic behaviour in the inter-causeway area of Roberts Bank. This report determined that there is a substantial risk that a new opening in the causeway could initiate a new sequence of morphological changes on the tidal flats, which could adversely affect the existing habitat conditions. Furthermore, the assessed opening would be expected to have only a minimal contribution to flushing flows in the inter-causeway area. The report is available on the Project website: http://www.robertsbankterminal2.com/wp-content/uploads/RBT2-Potential-Effects-of-Opening-the-Causeway-June-2005-NHC-Memo-January-2014.pdf. Based on the findings of this report, and the evaluation of adding a flow passage channel, the VFPA does not propose to open the Roberts Bank causeway. Further information concerning this study is available in the VFPA's response to IR1-13. **Addressed in the EIS Appendix 7.2-B (#52):** EIS Section 9.5 describes existing conditions on Roberts Bank, including the past influences of the Roberts Bank causeway and BC Ferries Terminal causeway on the Roberts Bank ecosystem. The potential effects of the Project on ocean currents (hydrodynamics), wave climate, and local seabed scour and deposition (morphodynamics) were investigated using the TELEMAC numerical modelling system. Since no reasonably foreseeable projects or activities were identified during the assessment that will influence or change the conditions of coastal geomorphology within proximity of the Project, an assessment of future incremental cumulative changes to coastal geomorphology was not undertaken. **Addressed in response to IR2-09:** Additional clarification is provided in the VFPA's response to IR2-09, which describes how sand was deposited on the north side of the causeway during the initial causeway construction activities in 1969. These sediments have persisted and are not the result of ongoing coastal geomorphology processes. **Further information provided by the VFPA:** **07-Jan-2014, Letter from the VFPA to Penelakut Tribe:** The potential effects of opening the causeway were assessed by Northwest Hydraulic Consultants Ltd. in June 2005. Based on the tidal influence in the area, it was determined that there would be no benefit with regard to introducing flows through the causeway (e.g., the amount of water that would flow through the opening would be very small compared to the tidal exchange in the inter-causeway area), and such an opening may actually result in new channel formation and concurrent erosion of existing eel grass.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 9.5 Coastal Geomorphology 9.5.5 Methods 9.5.6 Existing Conditions 9.5.9 Future Conditions with the Project and Other Projects and Activities Appendix 9.5-B Rationale for Exclusion of Other Certain and Reasonably Foreseeable Projects in the Cumulative Change Assessment of Coastal Geomorphology **2005 Memorandum Concerning Potential Effects of Opening the Roberts Bank Causeway** http://www.robertsbankterminal2.com/wp-content/uploads/RBT2-Potential-Effects-of-Opening-the-Causeway-June-2005-NHC-Memo-January-2014.pdf. **Information Requests** Response to Sufficiency Information Request #13 (IR1-13 of CEAR Document #897) Response to Sufficiency Information Request #09 (IR2-09 of CEAR Document #961)
STZ-5.2	Asked how the Project affects the water. Asked for further clarification related to changes in geomorphology	01-Nov-2013, Meeting with Cowichan Nation Alliance 22-Oct-2014, Cowichan Nation Alliance	**01-Nov-2013, Meeting:** Noted that studies are being conducted on coastal geomorphology. Noted that the studies will form the basis of the environmental assessment and they are ongoing.	**Addressed in EIS Appendix 7.2-B (#48):** Coastal geomorphology considers the physical processes such as waves and currents that change or maintain the physical environment of coastal areas. An assessment was undertaken to determine potential changes to coastal geomorphology as a result of the Project.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 9.5 Coastal Geomorphology 9.6 Surficial Geology and Marine Sediment

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
	associated with the proposed Project. Asked what the environment will look like with changes in accretion and siltation.	EIS Workshop #1	**22-Oct-2014, Workshop:** Responded that the environment will experience only very slow change. Stated that there is not expected to be a lot difference with the addition of the proposed Project. Referred to the image on slide 31 of the presentation that illustrated where a difference is expected. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	The assessment consisted of three study approaches to determine the potential effects of changes to natural processes from the Project footprint in subtidal and intertidal areas. Studies were informed by dialogue with the Coastal Geomorphology Technical Advisory Group (TAG). The results of the coastal geomorphology assessment were considered in the assessments of surficial geology and marine sediment, marine water quality, marine vegetation, marine invertebrates, marine fish, marine mammals, coastal birds, ongoing productivity of commercial, recreational, and Aboriginal fisheries, and archaeological and heritage resources. The Project layout and configuration have been modified to reduce the potential for a number of adverse changes to geomorphology during Project construction and operation. For example, developing the terminal almost entirely within the subtidal zone of Roberts Bank will largely avoid changes to geomorphology. Changes to coastal geomorphology are not expected from terminal development activities, but are related to the terminal footprint itself. The footprint will interact with tidal currents and wind-generated waves resulting in alterations to sediment transport, sediment erosion and deposition, and water flow exchange in the construction and operation phases. During causeway construction, drainage channels are expected to form on the tidal flats adjacent to the causeway. This change will occur during construction only, and will be temporary and reversible. The VFPA will ensure the study and management of potential channel formation related to drainage of tidal waters through the causeway dyke during the construction phase. Changes will be incorporated in detailed design, as required. Changes from the expansion of the tug basin include the conversion of local tidal flats to subtidal waters. Although the formation of additional tidal channels is not anticipated, a small increase in the size of an existing channel is likely. No incremental cumulative changes in coastal geomorphology are anticipated to result from the Project in combination with other projects and activities. **Addressed in response to IR2-08:** As outlined in the VFPA's response to IR2-08, ongoing geomorphic processes have resulted in changes to the Fraser River delta foreslope (located in deeper water at the outer edge of the tidal flats) in the vicinity of the proposed terminal. Construction of RBT2 will result in armouring of a 1,700 m long section of the foreslope down to -30 m chart datum (CD), and will effectively halt any erosion of the foreslope in that area that may be occurring at present. **Addressed in responses to IR2-07 and IR2-09:** As outlined in the VFPA's responses to IR2-07 and IR2-09, topographic changes on the tidal flats have been evaluated, including changes to existing tidal channels. These changes are related to ongoing geomorphic processes as well as changes related to previous construction of the causeway and existing terminals. Widening of the causeway and development of RBT2 is not predicted to change drainage patterns or the morphology of the tidal flats in this area north of the causeway in the future with the Project. **Addressed in response to IR2-16:** Clarification concerning the assessment of changes to coastal geomorphology that may occur in relation to the construction and operation of the proposed Project is provided in the VFPA's response to IR2-16. The response confirmed that all Project components have been assessed in	9.7 Marine Water Quality 9.7.8 Future Conditions with the Project 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current Use of Lands and Resources for Traditional Purposes 35.0 Effects Assessment Summaries **Information Requests** Response to Sufficiency Information Request #07 (IR2-07 of CEAR Document #961) Response to Sufficiency Information Request #08 (IR2-08 of CEAR Document #961) Response to Sufficiency Information Request #09 (IR2-09 of CEAR Document #961) Response to Sufficiency Information Request #16 (IR2-16 of CEAR Document #961) Response to Sufficiency Information Request #17 (IR2-17 of CEAR Document #961)

Stz'uminus First Nation

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
				accordance with the requirements of the *Updated EIS Guidelines* for the local study area, which extends from the BC Ferries Terminal to Canoe Passage. **Addressed in response to IR2-17:** The VFPA's response to IR2-17 includes additional clarification concerning the expected extents of changes to coastal geomorphology related to the proposed Project. Changes to coastal geomorphology and hydrodynamic conditions in areas on the south side of the existing Roberts Bank causeway, including the inter-causeway area and areas south of the BC Ferries Terminal, that are related to the Project components on the north side of the causeway are not anticipated because areas on the south side are hydrodynamically isolated from the north side of the Roberts Bank causeway by deep water and the presence of the existing causeways. The only Project component expected to influence coastal geomorphology or hydrodynamics in the inter-causeway area is the expanded tug basin, which is expected to result in localised changes to the existing coastal landforms in that area.	
STZ-5.3	Concerned that Canoe Pass is getting closed off because of the current terminal configuration and corresponding build-up of sand.	01-Nov-2013, Meeting with Cowichan Nation Alliance	**01-Nov-2013, Meeting:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#49):** Field studies, air photo review, and modelling of sediment deposition at Roberts Bank (including Canoe Passage) were undertaken during the Project assessment, as described in the EIS. A Canoe Passage discharge channel location and sediment distribution (e.g., bar formation or buildup of sand) were modelled to assess variation pre and post-terminal construction. Potential changes associated with the configuration of RBT2 were assessed in relation to Roberts Bank, including the Canoe Passage discharge channel. Project-related changes to coastal geomorphological processes on Roberts Bank are predicted to be associated with the terminal footprint. However, the Project is not anticipated to alter sediment dynamics or water movement in and around the mouth of the Fraser River. Changes are anticipated around the terminal and within the intertidal zone shoreward of the terminal. The effects of these changes on VCs are considered in the EIS.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table

Table 6: Economic Development – Valued Component

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information

STZ-6.1	Asked whether potential negative impacts on other industries are assessed in the economic development valued component.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014, Workshop:**
			Responded that the impacts on other industries was assessed in the EIS.
			01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:
			Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.
				Addressed in EIS Appendix 7.2-B (#113):
				The economic development assessment evaluated potential Project-related effects on local and regional economies, and focused on:
				• Business revenues associated with the direct supply of materials, goods, and services to the Project for construction and operation;
				• Business revenues associated with supply of inputs to the businesses that are directly supplying goods and services to the Project;
				• Induced revenues for businesses related to household spending by workers employed as a result of the Project;
				• Construction sand supply and consumption; and
				• Consistency with economic development plans.
				The economic development assessment concluded that:
				• The Project is expected to result in the following positive effects on economic development in Metro Vancouver:
				  ○ During the 5.5 year construction phase:
				  ▪ $837 million in additional gross revenues to businesses in Metro Vancouver
				  ▪ $238 million in induced household spending in Metro Vancouver
				  ○ During operation:
				  ▪ $31 million annually in materials, good, and services contracting revenue to the economy of Metro Vancouver
				  ▪ $71 million of annual induced household spending in in Metro Vancouver
				• The Project is expected to result in an increase in materials, goods, and services contracting revenues for Indigenous businesses located in Metro Vancouver.
				• The Project is expected to result in negligible effects on construction sand availability and price.
				• The Project is consistent with economic development strategies in Metro Vancouver's Regional Growth Strategy, the economic development objectives of the City of Delta, and the general directions set out in the Tsawwassen Land Use Plan of Tsawwassen First Nation.
				• The Project is expected to result in positive effects to economic development in Metro Vancouver; therefore, the Project is not expected to result in measurable adverse residual effects. The Project is not expected to result in incremental adverse cumulative effects on economic development.
				• The economic development assessment includes assessment of potential adverse effects on local sand supply, resulting from the Project-related demand, as well as potential adverse effects on labour market balance (including wage inflation or labour shortages). Further details on rationale for the scope, methods, and conclusions are provided in EIS Section 20.0.
					EIS

STZ-6.3	Concerned about the labour market and economic development studies excluding Aboriginal members and/or communities located outside the Metro Vancouver region.	11-Dec-2014, Health & Aboriginal Rights Workshop – Cowichan Nation Alliance	**11-Dec-2014:** Recorded comment for consideration by Project team. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **19-Apr-2016, Letter from the VFPA to Stz'uminus First Nation:** Shared meeting notes from the 11-Dec-2014 workshop, which included the following post-meeting note: As noted in the response for issue ID# 111 of RBT2 EIS Appendix 7.2-B, the local assessment area (LAA) for labour market and economic development was defined as Metro Vancouver. Cowichan community members living in Metro Vancouver will be reflected in the aggregate data for this region. The LAA was structured to capture the Project's potential labour market and economic development effects that will occur	**Addressed in the EIS Appendix 7.2-B (#111):** The LAA for labour market and economic development was defined as Metro Vancouver. Cowichan community members living in Metro Vancouver will be reflected in the aggregate data for this region. The LAA was structured to capture the Project's potential labour market and economic development effects that will occur locally and are measureable or detectable. While there may be members of Indigenous groups located outside of Metro Vancouver that participate in one or more aspects of Project employment, or other economic effects, the effects on the labour market and economies of these Indigenous groups were not considered to be measureable or detectable. **Addressed in EIS Appendix 7.2-B (#112):** Opportunities for training and employment opportunities related to the Project are described in EIS Section 32.3.3. As accommodation for any potential effects to specified Indigenous groups' ability to exercise their Aboriginal rights, the VFPA proposes to assist these Indigenous groups in accessing opportunities resulting from the Project. In addition to making contracting opportunities available to specified Indigenous groups, the VFPA will ensure that construction employment opportunities are also made available. To support these Indigenous groups in preparing for employment opportunities, the VFPA will provide training funding and undertake specific job-related information sharing activities, such as job fairs. Through ongoing engagement, the VFPA will seek input from these Indigenous communities with respect to plans to ensure access to Project-related benefits.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 18.0 Social and Economic Setting 18.4 Population 19.0 Labour Market 19.3.1 Spatial Boundaries 20.0 Economic Development 20.3.1 Spatial Boundaries 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.3.3 Mitigation Measures 34.0 Benefits to Canadians 34.2 Benefits of the Project 35.0 Effects Assessment Summaries Table 35-2 Proposed Mitigation Measures and Commitments

			locally and are measureable or detectable. While there may be members of Aboriginal groups located outside of Metro Vancouver that participate in one or more aspects of Project employment, or other economic effects, the effects on the labour market and economies of these Aboriginal groups were not considered to be measureable or detectable. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	The VFPA has consulted and will continue to engage with Indigenous groups regarding opportunities to benefit economically and socially from the Project.	

Table 7: Effects Assessment Methods (including Cumulative Effects)

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-7.1	Proposed that certain central terms be defined to ensure consistent use and understanding throughout the Project review process – namely "cumulative effect," "cumulative environmental effect," "mitigation," and "report".	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"The Canadian Environmental Assessment Agency (Agency) has developed a glossary of terms used in the context of the* Canadian Environmental Assessment Act, 2012 *(CEAA 2012) and it is available at: http://www.ceaa-acee.gc.ca/default.asp?Lang=en&n=E7F0FC59-1&offset=&toc=hide. In addition, CEAA 2012 defines the term "mitigation measures" as measures for the elimination, reduction or control of the adverse environmental effects of a designated project, and includes restitution for any damage to the environment caused by those effects through replacement, restoration, compensation or any other means."* *For the purposes of Crown consultation, if members of the Cowichan Nation Alliance would like to provide information to the Review Panel about the impacts of any aspect of the Project, including marine shipping, the Review Panel will receive this information as directed in Section 3.9."*	**Additional information provided by the VFPA:** In developing the EIS, the VFPA relied on federal guidance documents (such as noted by the CEA Agency in their April 17, 2015 letter (CEAR Document #278)). The EIS also includes a glossary (summary of definitions) applicable specifically to the EIS.	
STZ-7.2	Stated that in order to comprehensively assess the full extent of Project impacts, it is essential that the Review Panel consider cumulative effects that are measured against a pre-industrial baseline; this is necessary to understand the extent to which the environment and the ability of Aboriginal peoples to exercise Aboriginal and Treaty rights has already been compromised. Recommended that the draft ToR include a non-exhaustive list of projects and activities that should be included to ensure their impacts are considered e.g. the Tsawwassen Ferry Terminal, the Deltaport Terminal Road and Rail Improvement Project, the South Fraser Perimeter Road, the Tsawwassen First Nation Industrial Land Development, the Tsawwassen Mills and Power Centre and the Deltaport Third Berth Project.	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"A list of projects has been provided in the Environmental Impact Statement (EIS) Guidelines http://www.ceaa-acee.gc.ca/050/documents/p80054/97463E.pdf on page 31 and includes the following direction to the Proponent: "The EIS will include a narrative discussion of existing projects in the vicinity of the proposed project, including but not limited to the Tsawwassen Ferry Terminal, Deltaport Terminal Road and Rail Improvement Project, South Fraser Perimeter Road, Tsawwassen First Nation Industrial Land Development, Tsawwassen Mills and Power Centre and Deltaport Third Berth."* *On page 32 of the EIS Guidelines request that* "This narrative discussion should include historical data, where available and applicable, to assist interested parties to understand the potential effects of the project and how they may be addressed." *Also, if members of the Cowichan Nation Alliance have information relating to the state of the environment as it relates to the Project, including effects, we invite you to contact the proponent with any pre- industrial baseline information or data you*	**Addressed in response to AIR-12.04.15-13:** In the EIS, the existing conditions (baseline) reflect the conditions of the environment as modified by past development. Further discussion of how the VFPA considered the effects of past, present, and future projects is provided in completeness-phase AIR-12.04.15-13, including in that responses' schedules focused on applicable VCs.	**Information Requests** Response to Additional Information Request #13 (AIR-12.04.15-13 of CEAR Document #388)

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
			may have, including Aboriginal traditional knowledge."		
STZ-7.3	Stated that Cowichan Nation Alliance anticipates there will be a significant need for ongoing environmental monitoring of the integrity of the Fraser River estuary upon consideration of the growing number of developments in that area. Recommended express direction to the Review Panel to consider the value of ongoing monitoring. Recommended amendment to section 3.2 to of the ToR to address this concern.	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"Your comment has been considered. However, the Agency encourages you to provide any information or concerns you have related to the Fraser River estuary to the Review Panel for their consideration as part of the environmental assessment."*	**Addressed in EIS Section 33.5:** Similar to the Adaptive Management Strategy for DP3, as described in EIS Section 33.5, the VFPA is committed to developing and implementing a Follow-up Program for the Project. The purpose of the Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project. To ensure the Program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the EIS. The Follow-up Program will include: • An evaluation of the adequacy of existing data to provide a benchmark against which to test Project-related effects; • A monitoring design drawing on the measurable parameters identified to be field-tested; • A methodological approach for using field-collected data to measure and verify the accuracy of the effects predicted in the EIS; • A reporting framework that defines frequency of reporting, distribution and feedback mechanisms; and • Details of the VFPA's approach to adaptive management for the Project through construction and operation. The Follow-up Program will be developed in consultation with federal agencies, including the CEA Agency, Fisheries and Oceans Canada (DFO), and Environment and Climate Change Canada (ECCC). Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on the program and approving agencies have an opportunity to evaluate and approve the program. Feedback from Indigenous groups regarding the draft program will be sought through the VFPA's ongoing engagement initiatives.	**EIS** 33.5 Roberts Bank Terminal 2 Follow-up Program
STZ-7.4	Stated that the Review Panel's identification and recommendation of mitigation measures aimed at addressing potential impacts to Aboriginal and Treaty rights is a significant aspect of the Project review. As such, it is critical that the Review Panel be directed to consider all relevant factors when undertaking this task. For example, the Review Panel's consideration should not be restricted solely to the information received pursuant to section 3.5, but should also include the Review Panel's analysis of the section 2.1 factors, including the Review Panels' assessment of the effects of the Project on asserted and established	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"Section 3.7, now Section 3.11, has been revised to direct the Review Panel to use information received throughout the environmental assessment, which allows it to use information collected under any section of the Terms of Reference.* *Please see page 3 of the "Aboriginal Consultation and EA Handout" http://www.ceaa-acee.gc.ca/050/documents/p80054/100180E.pdf for further details. If the Cowichan Nation Alliance has information or opinions on*		

Stz'uminus First Nation

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
	Aboriginal and Treaty rights, including cumulative effects and the significance of those effects. Stated that it is also important that section 3.7 reflect the importance of considering impacts to Aboriginal and Treaty rights independent of the Review Panel's recommendation of mitigation measures. Recommended that the Review Panel specify the degree to which each recommended mitigation measure will avoid or minimise the potential adverse effects of the Project on Aboriginal and Treaty rights. This aspect of the analysis is fundamental to the determination of whether a particular mitigation measure is suitable, whether additional accommodation of Aboriginal and Treaty rights is warranted, and may ultimately influence whether the Project should proceed. Recommended amendments to section 3.7 of the draft ToR to address this concern.		*proposed mitigation during the EA process, the Review Panel would welcome that information. The Review Panel has been mandated to provide in its report rationale, conclusions and recommendations on the environmental assessment including any mitigation measures and follow up programs. Section 3.11 allows the Review Panel to make recommendations, which will be considered by the Crown, on avoiding or mitigating environmental effects related to potential impacts on potential or established Aboriginal or Treaty rights.* *At the end of the process it is up to the federal government to decide whether or not to adopt the recommendations contained in the Review Panel's report."*		
STZ-7.5	Asked whether the EwE Model Study Area predicts Project impacts south of the American border.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014, Workshop:** Responded that the answer varies based on the VC in question, but there may be some localised effects. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests, including concerns around cumulative effects, and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#101):** The ecosystem model is described in the EIS. The model incorporated predator-prey relationships (biotic factors) and environmental factors within the marine environment. No productivity changes, as determined by the ecosystem model, are anticipated outside of Canadian waters, as productivity-related effects result from construction activities, the Project footprint itself, and indirect localised changes to coastal processes around the terminal.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 10.0 Biophysical Setting 10.3 Overview of Assessing Ecosystem Productivity Appendix 10.3-A Roberts Bank Ecopath with Ecosim and Ecospace Model Parameter Estimates Appendix 10.3-B Roberts Bank Ecosystem Model Development and Key Run Appendix 10.3-C Roberts Bank Spatial Ecosystem Model Sensitivity Analysis Appendix 10-D Roberts Bank Spatial Ecosystem Model Sensitivity Analysis
STZ-7.6	Asked about the third party review of the EwE model: who is conducting the review, what the review consists of, and why the review is being conducted.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014, Workshop:** Stated that a VFPA-commissioned third party is conducting the review who is experienced in the study of marine ecosystems and modelling, and speculated that he will be looking at the inputs, the results, and assessing whether or not they are valid and based on correct information.	**Additional information provided by the VFPA:** In January 2014, the federal Minister of Environment referred the Project for an environmental assessment by an independent review panel. The entire EIS, including the EwE (Ecopath with Ecosim and Ecospace) model, also referred to as the Roberts Bank ecosystem model, is subject to review by the Review Panel. The independent review of the EwE model commissioned by the VFPA (as noted in the previous column) was undertaken prior to finalisation	**Information Requests** Response to Information Request #6 (IR-7.31.15-06 of CEAR Document #314) Information Request Package 3 Preamble in Support of Responses to IR3-01 to IR3-24 –

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
			Explained that David Preikshot (the independent reviewer) has a PhD in Fisheries Science at UBC.	of the EIS. The results of the review informed and were incorporated into the model as it is presented in the EIS. **Addressed in Information Request Package 3 Preamble in Support of Responses to IR3-01 to IR3-24:** As noted in the Preamble in Support of Responses to IR3-01 to IR3-24, the VFPA has actively responded to questions about the application of the Roberts Bank ecosystem model, including through completeness information request responses (see IR-7.31.15-06) and in separate, agency-specific engagement. DFO and Natural Resources Canada (NRC) provided written questions to the VFPA based on a preliminary review of the EIS on November 19, 2015, ahead of an in-person meeting on November 23, 2015. The meeting included representatives from the VFPA, NRC, DFO, ECCC, and other federal agencies. Following this large-scale engagement, a series of more topic-specific meetings were held with individual and/or combinations of agencies through December 2015 and February 2016. Involving DFO, NRC, ECCC, and the VFPA, the meetings provided clarity on topics such as hydrology, sediment modelling, and ecosystem modelling questions posed by the agencies. The VFPA provided a cumulative submission of responses to the agencies in March and May 2016, and these questions and responses were posted to the CEA Agency's registry on September 28, 2016 (CEAR Document #547). In December 2016, the Canadian Science Advisory Secretariat of the DFO Science Branch released its independent review of the Roberts Bank ecosystem model (CEAR Document #900). Numerous federal experts conducted the review, including from DFO and the Canadian Wildlife Service. The general conclusions of the review support how the model was established and agreed that input parameter estimates were adequate for the Roberts Bank ecosystem. Importantly, the DFO Science Branch (with input from NRC) concluded "the EwE model, as implemented in this project and reviewed here, is a useful first-order framework to organise information and derive initial estimates of how the system may respond to perturbations" (CEAR Document #900, p.20).	Roberts Bank Ecosystem Model (CEAR Document #928) **From the VFPA to the Review Panel re: Answers to preliminary technical questions submitted during the completeness phase from DFO, NRC, and Environment and Climate Change Canada, concerning the ecosystem modelling to support the RBT2 environmental review (NOTE: Updated September 28, 2016) (CEAR Document #547)**
STZ-7.7	Asked about the funding for the ecosystem productivity model and whether the model is objective.	03-Jul-2014, Aboriginal Groups Valued Components Workshop #2	**03-Jul-2014, Workshop:** Explained that the VFPA is working with the University of British Columbia's Fisheries Centre (now the Institute for the Oceans and Fisheries), a leader in ecosystem modelling and the key developer of the EwE approach. Stated that in the environmental assessment application will have all the different assumptions used, all the data sources and why the technical team picked those, for people to critique and give the VFPA feedback on. Stated that the VFPA is trying to be as transparent and open as possible.	**Addressed in Information Request Package 3 Preamble in Support of Responses to IR3-01 to IR3-24:** The VFPA obtained input on selecting the appropriate approach to assessing productivity at Roberts Bank through the Productive Capacity TAG process. The TAG process recommended use of the EwE model, which is well documented in the scientific literature and has been widely used to quantitatively describe marine food webs, fisheries policy exploration (regulatory decisions on managing fisheries), ecosystem-based fisheries management, and a joint B.C.-Canada environmental assessment. The EwE model was developed at the Institute for the Oceans and Fisheries, and more than 400 ecosystem models applying the software have been published. Thirteen of these publications describe marine areas in B.C., six of which are located in the Strait of Georgia. More information on this model can be found at http://www.ecopath.org/.	**Information Requests** Information Request Package 3 Preamble in Support of Responses to IR3-01 to IR3-24 – Roberts Bank Ecosystem Model (CEAR Document #928)

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
				Additional information concerning the VFPA's selection and use of the EwE model in the environmental assessment is available in Information Request Package 3 Preamble in Support of Responses to IR3-01 to IR3-24.	
STZ-7.8	Noted stark disagreement between the Cowichan Nation Alliance and the VFPA about how cumulative effects are assessed and applied to impacts to Rights. Expressed concern with the cumulative effects studies.	11-Dec-2014, Health & Aboriginal Rights Workshop – Cowichan Nation Alliance 29-Aug-2017, Follow Up Program Workshop with Cowichan Nation Alliance, Lyackson First Nation, and Malahat First Nation	**11-Dec-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests, including concerns around cumulative effects, and provided the VFPA's responses. **29-Aug-2017, Workshop:** Committed to provide information from the EIS and information requests related to cumulative effects studies for RBT2. **20-Feb-2018, Email from the VFPA:** The VFPA provided draft meeting notes from the 29-Aug-2017 Follow-up Program Workshop. A post-meeting note was included regarding cumulative effects: *"Section 8.1.9 of the RBT2 EIS describes the cumulative effects assessment methodology for the RBT2 environmental impact assessment. An assessment of future cumulative effects was conducted when an adverse residual effect was predicted to occur to a valued component (VC) due to a Project-related interaction. For an intermediate component (IC), an assessment of future cumulative change was conducted to assess when Project-induced changes to an IC may combine cumulatively with changes caused by other projects and activities that will be carried out. Assessment of future cumulative effects for VCs and future cumulative change for ICs can be found in the following sections of the EIS:* *ICs:* • *Air Quality: Section 9.2.9* • *Noise and Vibration: Section 9.3.10* • *Light: Section 9.4.9* • *Coastal Geomorphology: Section 9.5.9* • *Surficial Geology and Marine Sediment: Section 9.6.9* • *Marine Water Quality: Section 9.7.9* • *Underwater Noise: Section 9.8.8* *Biophysical VCs:* • *Marine Vegetation: Section 11.10* • *Marine Invertebrates: Section 12.10*	**Additional information provided by the VFPA:** The *EIS Guidelines* issued by the CEA Agency do not require a cumulative effects assessment with respect to the ability of Indigenous groups to exercise their asserted or established treaty or Aboriginal rights. **Addressed in EIS Appendix 7.2-B (#27):** The methods used to assess the potential effects of the Project, including mitigation measures, residual effects, and cumulative effects, are described in EIS Section 8.0. The environmental assessment for the Project was developed to meet the requirements specified in the *EIS Guidelines* and is consistent with existing guidance documents, including the "Operational Policy Statement Assessing Cumulative Environmental Effects Under the *Canadian Environmental Assessment Act 2012*" and "Determining Whether a Project is Likely to Cause Significant Adverse Environmental Effects," the "Cumulative Effects Assessment Practitioners' Guide," and the "Guideline for the Selection of Valued Components and Assessment of Potential Effects," among others. Descriptions of existing pre-Project conditions relevant to each VC and IC were developed based on existing information, field studies, data analysis, and modelling. The description of existing conditions considered how ICs and VCs have been already affected by other projects and activities that have been carried out. Expected conditions were also determined where substantial changes are expected to occur to a VC or IC in the future prior to Project construction or operation, such as from changes in regulation or as a result of other projects or activities currently underway. Potential Project-related effects that may persist after the implementation of mitigation measures are called residual effects. The EIS identifies Project-related residual effects and their significance. The determination of significance is specific to each VC and the EIS presents the rationale for the significance thresholds applied. Where measurable residual effects to a VC have been predicted to result from the Project, a cumulative effects assessment was conducted to determine whether Project-related residual effects are likely to interact cumulatively with the effects of other projects and activities. Similarly, where Project-induced changes to an IC were expected, the potential for those changes to combine cumulatively with changes caused by other projects and activities was assessed. Where the Project was predicted to contribute to cumulative effects, additional mitigation measures were considered. The VFPA then determined the significance and likelihood of any adverse residual cumulative effects following the implementation of mitigation measures. Where it was determined that potential adverse effects could occur, technically and economically feasible mitigation measures to avoid, reduce, or offset potential adverse effects to an acceptable level have been proposed. The design and implementation of proposed mitigation	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 8.0 Effects Assessment Methods 8.1 Environmental Assessment Methods 8.1.6 Mitigation Measures 8.1.7 Characterisation of Residual Effects and Context 8.1.8 Determination of Significance of Residual Adverse Effects 8.1.9 Cumulative Effects Assessment ***Updated EIS Guidelines***

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
			• *Marine Fish: Section 13.10* • *Marine Mammals: Section 14.10* • *Coastal Birds: Section 15.11* *Socio-Economic VCs:* • *Marine Commercial Use: Section 21.11* • *Visual Resources: Section 25.10* • *Land and Water Use: Section 26.10* • *Human Health: Section 27.10* • *Cumulative Effects Assessment: Section 28.10* *Information requests related to cumulative effects for RBT2 include:* • *IR #13 – Cumulative Effects Assessment* • *AIR #13 – Cumulative Effects Assessment"*	measures considers input received from regulators, Indigenous groups, local government, and the public. The methods used to assess the potential effects of the Project, including mitigation measures, residual effects and cumulative effects, are described in the EIS. The VFPA has consulted with Indigenous groups regarding Project components and activities, selection of VCs, the potential effects of the Project, proposed mitigation measures, and potential changes to the environment related to the Project. Indigenous groups were also provided draft community profiles and rights and Current Use information for their review and comments. Feedback received was incorporated into the EIS.	
STZ-7.9	Concerned about the use of representative species in the assessment.	03-Jul-2014, Aboriginal Groups Valued Components Workshop #2	**03-Jul-2014, Workshop:** Provided participants with a handout showing ICs, VCs, and species represented by each VC. Discussed how representative species are used in environmental assessments. Explained that for example for the VC marine fish, there are a number of representative focal species and sub-components, more for ease of organisation than anything. For marine fish there are five sub-components, and of those, 13 focal species are covered. Explained why those focal species were selected and some of the studies that supported our selection. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests, including concerns around cumulative effects, and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#25):** ICs, VCs, and VC sub-components are identified in EIS Section 8.0. EIS Section 8.0 describes the overall 3-step VC selection process, including the rationale for focusing the assessment on VC sub-components. The rationale for selection of specific ICs, VCs, and VC sub-components is described in each assessment section. For example, discussion regarding sub-component selection relative to species of importance to Indigenous groups, including eulachon and sturgeon, is captured in EIS Section 13.0. **Addressed in EIS Section 8.0:** Subsequent to VC selection, VC sub-components were identified to further structure and streamline the assessment as appropriate. For example, for biophysical VCs, sub-component species or groups were chosen for the ability to represent other species that are similar in nature, occupy comparable types of habitats, serve similar ecological roles, or could otherwise be affected by the Project in an analogous way. In selecting representative species, or in some cases species groups, consideration was given to species of specific importance to regulatory agencies, Indigenous groups, and the public, as identified by community knowledge and ITK, and during consultation and engagement, and assessment planning. **Addressed in Information Request Package 5 – Response to Information Requests Relating to Representative Species:** Representative species are considered in terms of the biological and ecological similarities they share with other species within the sub-component, and for potential similarities in how the Project may interact with and affect them. In some cases, biological attributes may differ within a sub-component grouping, but their interactions with the Project and mechanisms contributing to potential effects from the Project are considered to be analogous. As a result, the VFPA selected representative species for each sub-component for which sufficient information is known, in order to provide an assessment that considers all potential interactions and Project-related effects. For example, substantial information exists for the southern resident killer whale (the representative species used for toothed marine mammals) and much less so for the transient killer whale. While there are some biological differences between the two, they are considered the same species; both rely on underwater noise for prey detection;	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table 8.0 Effects Assessment Methods **Information Requests** Information Request Package 5 – Response to Information Requests Relating to Represented Species

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
				and potential Project effects and mitigation measures are the same. In this example, it would be both impractical and inefficient to undertake an assessment on both species as the conclusions of the assessment would be the same. Moreover, in selecting representative species, or in some cases species groups, consideration was given to species of specific importance to regulatory agencies, Indigenous groups, and the public, as identified by community knowledge and ITK, and during consultation and engagement, and assessment planning. This approach was taken as it would be impractical to characterise existing conditions and assess effects on every species that may frequent the Roberts Bank area. In this way, the use of VCs, sub-components, or representative species improves the effectiveness and efficiency of assessment by focusing on the key Project interactions.	
STZ-7.10	Stated that the broad drafting of the VCs risks insufficient coverage of environmental components of importance to the Cowichan Nation Alliance. Requested that the following species be listed under the relevant Valued Component heading: i. Marine vegetation: green seaweed ii. Coastal terrestrial vegetation: bull rush, reeds, cranberries, blueberries, camas iii. Marine fish: Coho, Spring, Chum, Pink, Chinook, and Sockeye Salmon, eulachon, herring, cod, halibut, flounder and sturgeon iv. Marine invertebrates: red sea urchin, sea cucumber, and mussels v. Marine mammals: harbour seal vi. Migratory birds: Brant geese, canvasback duck, Common Merganser, and Mallard	09-May-2014, Letter from Cowichan Tribes acting in alliance with the Stz'uminus, Penelakut, Hwlitsum and Halalt communities	**09-May-2014:** Recorded comment for consideration by Project team. **06-Jun-2014 and 03-Jul-2014, Workshops:** Aboriginal Groups Valued Components Workshop #1 and #2 provided an opportunity for Indigenous groups to comment on the VCs.	**Addressed in EIS Volume 3:** i. Marine vegetation: Green seaweed (EIS Section 11.0 has been included as the marine vegetation sub-component macroalgae, which includes *Ulva* spp., as well as other brown algal species (bull kelp, rockweed). ii. Coastal terrestrial vegetation: bull rush, reeds, cranberries, blueberries, camas (EIS Section 11.0). This was considered when selecting marine vegetation sub-components (EIS Section 11.2.1). As the Project is located in the marine environment and Project-related interactions with terrestrial vegetation species are not anticipated, these species were not incorporated into the effects assessment (without an interaction, there is no potential for an effect on these species). iii. Marine fish: coho, spring, chum, pink, Chinook, and sockeye salmon, eulachon, herring, cod, halibut, flounder, and sturgeon (EIS Section 13.0). • All Pacific salmon were considered in the assessment under the sub-component Pacific salmon. Chum and Chinook were selected as representative species for the five salmon species, as they are more estuarine dependent (any predicted effects to chum and Chinook are representative of effects to the other species). Refer to EIS Section 13.2.1 for more information. • Eulachon was assessed through representative forage fish species (see EIS Sections 13.6.2.1 and 13.6.3.3). Eulachon was not selected as a representative species as it is rare within the marine fish LAA based on surveys conducted at Roberts Bank and Sturgeon Bank in past years (EIS Section 13.2). • Pacific herring was included in the assessment as a representative species under the forage fish sub-component. • Lingcod was included in the assessment as a representative species under the reef fish sub-component. Rock cod were assessed through their representation by rockfish, as discussed in EIS Section 13.5.2. • Starry flounder was included in the assessment as a representative species under the flatfish sub-component. Pacific halibut are not typically found in estuarine environments (including the Fraser River estuary) and	**EIS** 11.0 Marine Vegetation 11.2.1 Sub-components 12.0 Marine Invertebrates 13.0 Marine Fish 13.2 Selection of Marine Fish Valued Component 13.2.1 Sub-components 13.5.2 Selection of Marine Fish Valued Component 14.0 Marine Mammals 14.2.1 Sub-components 15.0 Coastal Birds 15.2.1 Sub-components

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
				therefore would not interact with and be adversely affected by the Project. • Sturgeon were assessed through the use of Chinook and chum salmon representative species. Sturgeon was not selected as a representative species as it is also rare within the marine fish LAA. Refer to EIS Section 13.2.1 for more information. iv. Marine invertebrates: red sea urchin, sea cucumber, and mussels (EIS Section 12.0). • Red sea urchin and sea cucumbers were assessed through the use of Dungeness crab representative species. Red sea urchin and sea cucumbers were considered when selecting marine invertebrate sub-components, but were not selected as representative species as their typical habitat is not an estuarine sand-dominated environment like Roberts Bank. As such, Project-related effects to these species are anticipated to be very limited. • Mussels (specifically the bay mussel (*Mystilus trossulus*)) was included in the assessment under the bivalve shellfish sub-component. v. Marine mammals: harbour seal (EIS Section 14.0). • Harbour seal was considered and included in the marine mammal's effects assessment under the seals and sea lions sub-component. vi. Migratory birds: Brant geese, canvasback duck, Common Merganser, and Mallard (EIS Section 15.0). Brant was included in the coastal birds' effects assessment as a representative species of the waterfowl sub-component. American Wigeon represented Mallard, while common merganser and canvasback duck are represented within the diving bird sub-component. These latter two species were not selected as representative species as they are not common at Roberts Bank, nevertheless, any potential effects to these species are assessed through more common species (that have been selected as representative species). Refer to EIS Section 15.2.1 for more information.	
STZ-7.11	Requested more information on the scope and purpose of field studies.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014, Workshop:** Stated that the studies have been undertaken, and will be included in the EIS for review. Each IC and VC section of the EIS contains information on field studies that were undertaken in support of the EIS.	**Additional information provided by the VFPA:** In 2012, the VFPA initiated field, desktop (i.e. literature review), and modelling studies to inform the understanding of existing conditions at Roberts Bank. Building on available information, these studies were designed to address known data gaps, as well as issues and interests of Indigenous groups, stakeholders, and the public, as well as to provide baseline information to assess Project-related effects as part of the environmental assessment. Some Technical Data Reports are appendices to EIS sections, while others are available publicly on the RBT2 website: http://www.robertsbankterminal2.com/environmental-assessment/technical-data-reports/	**RBT2 Project website** http://www.robertsbankterminal2.com/environmental-assessment/technical-data-reports/
STZ-7.12	Stated that scoping is arguably the most important part of EIS preparation and Aboriginal interests must be considered,	15-Jun-2015, Letter to the CEA Agency from Cowichan	**01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous	**Addressed in responses to IR-7.31.15-08 and MSA IR-02.24.16-4:** How ITK was utilised in the EIS and MSA is described in the VFPA's response to IR-7.31.15-08 and MSA IR-02.24.16-4.	**EIS** Appendix 7.2-A Consultation Activities by Aboriginal Group

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
	particular during the selection of Valued Components and defining baseline conditions. Requested a rationale for excluding Cowichan Nation Alliance participation in the TAG process. As described further in Section 7.4, the TAG process focused on four key areas identified by [the VFPA]: 1. Coastal Geomorphology, 2. Productive Capacity, 3. Biofilm and Shorebirds, and 4. Southern Resident Killer Whales. Requested a rationale for how the four key areas represent the breadth of Aboriginal interests on Roberts Bank. Stated that First Nations participated in the Technical Working Group process during the Deltaport Third Berth evaluation and deserve a place at the Technical Tables. Asked which technical gaps exist within this process due to inadequate Aboriginal participation.	Tribes and Stz'uminus First Nation (CEAR Document #242)	issues and interests and provided the VFPA's responses. **13-Oct-2015, Letters from the CEA Agency to Stz'uminus First Nation (CEAR Document #311):** *"The Agency has requested additional information on Aboriginal Traditional Knowledge in its letter of July 31, 2015 to [the VFPA] (page 3, #8). Within that information request the following was requested:* *"Provide a description of where and how Aboriginal traditional knowledge has been used to support the selection of valued components, baseline descriptions, the assessment of effects including the identification of mitigation measures, and in the determination of significance of adverse environmental effects. If Aboriginal traditional knowledge was not used, provide a rationale for why that information was not considered.""* *"This is a comment about the involvement of First Nations in [the VFPA's] TAGs and preparation of the EIS. This is not a completeness issue."* *"There is no requirement in the EIS Guidelines to focus TAG's work on specific topics. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	During the scoping phase of the environmental assessment, specific feedback was sought from Indigenous groups on a list of proposed VCs and sub-components. As described in EIS Appendix 7.2-A, a VC selection and rationale document was sent to Indigenous groups for review and feedback in April 2014. An additional opportunity for input on VC and sub-component selection was provided through participation by Indigenous groups in VC selection workshops held in June and July of 2014. In addition to these specific opportunities to provide feedback on VC and sub-component selection, as engagement activities continued, relevant information provided by Indigenous groups was taken into consideration (as described in EIS Section 7.2). **Addressed in EIS Appendix 7.2-B (#23):** The VFPA established the TAG process in 2012 to engage and consult with leaders in the technical and scientific community to provide guidance on four key topic areas – southern resident killer whales, biofilm and shorebirds, coastal geomorphology, and productive capacity. The TAG Terms of Reference and Summary Reports are available on the Project website: http://www.robertsbankterminal2.com/information-centre/project-documents/. The following Indigenous groups were invited to contribute to the TAG process: • Tsawwassen First Nation; • Musqueam First Nation; • Semiahmoo First Nation; • Tsleil-Waututh Nation; • Stó:lō Nation; and • Stó:lō Tribal Council. The TAG process was also discussed in meetings with Indigenous groups, and summary reports on the TAG process were provided to all Indigenous groups for review and comment. Additional information provided by the VFPA: Summary Reports are also available as appendices to the following IR responses: • Package 2 Preamble - Appendix IR2-A Coastal Geomorphology Technical Advisory Group Summary Report • Preamble in Support of Responses to IR3-01 to IR3-24 - Appendix IR3-A Productive Capacity Technical Advisory Group Summary Report • Appendix IR5-29-B Biofilm & Shorebirds Technical Advisory Group Summary Report • Appendix IR5-29-C Southern Resident Killer Whales Technical Advisory Group Final Report	Appendix 7.2-B Aboriginal Groups Interests and Issues Table 7.3.3.2 Consultation **Information Requests** Response to Information Request #8 (IR-7.31.15-08 of CEAR Document #314) Response to Additional Information Request #4 (MSA IR-02.24.16-4 of CEAR Document #386) Revised Responses to Information Request Package 2 (CEAR Document #961) Responses to Information Request Package 3 (CEAR Document #984) Response to Information Request #5 (IR56-29 of CEAR Doc #1185)
STZ-7.13	Requested information about the process whereby it was determined that a VC was of interest to Aboriginal groups. Asked which VCs were identified by Aboriginal groups.	15-Jun-2015, Letter to the CEA Agency from Cowichan Tribes and Stz'uminus First Nation (CEAR	**13-Oct-2015, Letters from the CEA Agency to Stz'uminus First Nation (CEAR Document #311):** *"The Agency has requested additional information on Aboriginal Traditional Knowledge*	**Addressed in responses to IR-7.31.15-08 and MSA IR-02.24.16-4:** How ITK was utilised in the EIS and MSA, including when it was used to inform VC selection, is described in IR-7.31.15-08 and MSA IR-02.24.16-4.	**EIS** 7.2 Aboriginal Groups Engagement and Consultation Appendix 7.2-A Consultation Activities by Aboriginal Group **Information Requests**

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
	Requested list of specific VCs that were selected based on Community Knowledge and ATK. Stated that candidate VCs of interest to Aboriginal groups were excluded if the following two additional questions were not answered affirmatively: "Does the candidate VC occur near or within the Project Area?" and "Could the Project interact with the candidate VC?" Asked how Community Knowledge and ATK was incorporated to answer these two additional questions.	Document #242)	*in its letter of July 31, 2015 to [the VFPA] (page 3, #8)."* See additional detail above. *"The Agency did not request additional information regarding VC selection since there is already some information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to VC selection to inform its sufficiency review."*	During the scoping phase of the environmental assessment, specific feedback was sought from Indigenous groups on a list of proposed VCs and sub-components. As described in EIS Appendix 7.2-A, a VC selection and rationale document was sent to Indigenous groups for review and feedback in April 2014. An additional opportunity for input on VC and sub-component selection was provided through participation by Indigenous groups in VC selection workshops held in June and July of 2014. In addition to these specific opportunities to provide feedback on VC and sub-component selection, as engagement activities continued, relevant information provided by Indigenous groups was taken into consideration (as described in EIS Section 7.2).	Response to Information Request #8 (IR-7.31.15-08 of CEAR Document #314) Response to Additional Information Request #4 (MSA IR-02.24.16-4 of CEAR Document #386)
STZ-7.14	Requested the threshold criteria which were adopted with respect to determination of significance of residual adverse cumulative effects. Stated that they need to understand what the thresholds as they dictate the classification of "significance."	15-Jun-2015, Letter to the CEA Agency from Cowichan Tribes and Stz'uminus First Nation (CEAR Document #242)	**13-Oct-2015, Letters from the CEA Agency to Stz'uminus First Nation (CEAR Document #311):** *"The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	**Addressed in EIS Section 8.0:** To determine the significance of residual adverse effects, the assessment considered the nature of each residual effect and the context within which it is expected to occur. The existing (or expected) condition of each VC was compared with the future conditions predicted to result from the Project. The anticipated future condition of each VC with the Project was compared to a threshold of significance defined for that specific VC. The threshold of significance is the point beyond which the integrity of the VC may be compromised, and the residual effect is considered to be significant. If the future condition of the VC with the Project does not exceed the defined threshold, the effect is considered to be not significant. If the future condition of the VC with the Project does exceed the defined threshold, the effect is considered to be significant. When defining the threshold of significance, the assessment included consideration of existing standards, guidelines, or objectives that have been established by government through regulation or applicable regional land and resource use management plans or other mechanisms, where available and suitable for determining significance. If no appropriate government-established threshold was available, the significance threshold was defined using the professional judgement of the Project team and current scientific knowledge about the VC. The rationale for the significance threshold used in the assessment and for the determination of significance is provided for each VC.	**EIS** 8.0 Effects Assessment Methods 8.1.8 Determination of Significance of Residual Adverse Effects
STZ-7.15	Asked why cumulative effects on the ability of First Nations to exercise Aboriginal rights was not identified as a VC.	15-Jun-2015, Letter to the CEA Agency from Cowichan Tribes and Stz'uminus First Nation (CEAR Document #242)	**13-Oct-2015, Letter from the CEA Agency to Stz'uminus First Nation (CEAR Document #311):** *"This item was not required by the EIS Guidelines. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review.* *Aboriginal groups are encouraged to describe to the Panel how past projects and the proposed project have/will potentially cumulatively impact First Nation's future ability to exercise asserted or established Aboriginal or Treaty rights.*		

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
			The Agency has requested additional information on cumulative effects in its letter of July 31, 2015 to [the VFPA] (page 8, #13). This information should inform the cumulative environmental effects of the proposed project and may assist in understanding potential cumulative impacts on First Nation's future ability to exercise asserted or established Aboriginal or Treaty rights."		
STZ-7.16	Asked if the cumulative effect of a 6% increase in container vessel traffic will become the tipping-point that results in measurable and undesirable impacts when all project-based vessel traffic increases are taken into consideration located within both B.C. and the State of Washington. Only southern resident killer whales were deemed to be near such a threshold.	13-Jan-2016, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #385)	**12-May-2016, Letter from the CEA Agency to Cowichan Nation Alliance (CEAR Document #398):** *"The Agency requested additional information on the projects used in the cumulative effects assessment in additional information request "#7 Reasonably Foreseeable Projects and Activities".* *In addition, the Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	**Addressed in MSA Section 6.7:** As noted in MSA Section 6.7, each assessment section in MSA Sections 7.0, 8.0, and 9.0 includes an assessment of potential additional future cumulative interactions between the residual effects anticipated for the VC (or residual changes for an IC), if any, and effects associated with additional marine shipping activity in the marine shipping area in 2030 related to reasonably foreseeable projects and activities. Projected future marine shipping traffic volumes are provided in MSA Table 4-7. These traffic volumes are associated with certain and reasonably foreseeable projects and activities listed in MSA Appendix 6-A. The significance determination for any residual cumulative effects is made using the same significance threshold as defined for the assessment of residual effects. Potential interactions with future certain or reasonably foreseeable marine-based projects are limited to increases in vessel traffic associated with those projects. The MSA concludes that no adverse cumulative effects are anticipated, with the exception of potential effects to southern resident killer whales. Consistent with the conclusions reached in the EIS, the MSA concludes that southern resident killer whales have already been significantly adversely affected by past projects and activities; therefore, cumulative effects are expected to remain significant. Further information concerning how significance criteria was utilised in the MSA is further discussed in MSA IR-02.24.16-7.	**MSA** 6.7 Cumulative Effects Assessment Appendix 6-A Certain and Reasonably Foreseeable Projects and Associated Activities Considered in the Marine Shipping Cumulative Effects Assessments 7.0 Physical Environment Effects Assessments 8.0 Marine Biophysical Environment Effects Assessments 9.0 Human Environment Effects Assessments **Information Requests** Response to Additional Information Request #7 (MSA IR-02.24.16-7 of CEAR Document #386)
STZ-7.17	Noted that identified rockfish predators include dolphins and porpoises, pinnipeds, southern resident killer whales, bald eagles, gulls and terns, juvenile and adult salmon, dogfish, large demersal fish, lingcod, rockfish, skate, and starry flounder. Requested a more accurate list. Asked why human withdrawals (i.e., fishing) were excluded.	15-Jun-2015, Letter to the CEA Agency from Cowichan Tribes and Stz'uminus First Nation (CEAR Document #242)	**01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **13-Oct-2015, Letter from the CEA Agency to Stz'uminus First Nation (CEAR Document #311):** *"The Agency did not request additional information for this item since there is already some information provided in the EIS in Section 16: Ongoing productivity of Commercial, Recreational and Aboriginal Fisheries Effects Assessment. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	**Addressed in EIS Appendix 7.2-B (#101):** The Roberts Bank ecosystem model is described in the EIS. The model incorporated predator-prey relationships (biotic factors) and environmental factors within the marine environment, and does not incorporate anthropogenic influences such as fishing. Since changes are determined by comparing productivity in the future with the Project, to the future without the Project, the level of human influence is deemed to be the same with and without the Project, and humans are not included in the food web.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table

Stz'uminus First Nation

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-7.18	Concerned that information can be manipulated in the assessment to minimise the appearance of impacts to certain species. For example: • Assessments average things out over populations and a period of time, and underrepresent the effect. • Species will have different baseline biomass depending on the time of the year.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014, Workshop:** Stated that results have not been averaged, and that the team fully understands a lot of species are there temporarily. Explained that this presentation is a high level summary and more detail and specificity will be provided in the EIS. For context, many birds are there for short periods of time. Even though they are there in large numbers for a few weeks, the biomass their presence amounts to over the course of a year is small, which is the timeframe used for the model; the model incorporates seasonal information.	**Additional information provided by the VFPA:** As is noted in the VFPA's response to preliminary questions from DFO and NRC in 2015, question 2.17 Time Steps (2.2.6), annual averages are used to include both spatial and temporal variation in biomass estimates for Roberts Bank. This allows comparisons across highly seasonal and endemic groups. Annual averages are a standard metric for ecological questions and are necessary when conducting an ecosystem level assessment (Harvey 2013, Mackinson and Daskalov 2008, and Preikshot 2013). Understanding that there is variability within any estimate, sensitivity analyses were conducted to examine model performance with a range of input biomasses, centred on the initial value (see question 2.7 (Use of Confidence Limits in RB Model) for more information on this) (CEAR Document #547).	**CEAR Document #547 from the VFPA to the Review Panel Re: Answers to Preliminary Technical Questions Submitted During the Completeness Phase from DFO, NRC And Environment and Climate Change Canada, Concerning the Ecosystem Modelling to Support the RBT2 Environmental Review**

Stz'uminus First Nation

Table 8: Engagement and Consultation

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-8.1	Stated that Cowichan Nation Alliance has yet to receive sufficient information regarding the framework that will guide Crown consultation to address potential impacts on Aboriginal and Treaty rights, and that will ensure the Crown discharges its constitutional duties prior to making any decisions about the Project. Recommended that Canada work with Aboriginal groups to develop a detailed consultation plan that includes a process and forum for groups to address issues arising from potential impacts to Aboriginal and Treaty rights from the Project.	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"The Crown sent letters to Cowichan Tribes, Stz'uminus First Nation, Penelakut First Nation, Halalt First Nation on January 7, 2014 with a proposed Consultation Workplan and invited comments or questions from the First Nations about the Crown's consultation process and proposed approach for discussing and addressing issues arising from potential impacts to Aboriginal and Treaty rights from the Project. We welcome a discussion on the proposed Consultation Workplan with any of the First Nations. To date, we have not received any feedback on the proposal."*		
STZ-8.2	Stated that the Review Panel clearly does not have a mandate to discharge all of the Crown's consultation obligations toward Aboriginal groups, as evidenced by section 3.4 of Draft ToR: the Review Panel is prohibited from deciding constitutional issues that engage Aboriginal rights including (a) the validity of potential or established Aboriginal or Treaty rights asserted by an Aboriginal group or the strength of such claims; (b) the scope of the Crown's duty to consult an Aboriginal group; (c) whether the Crown has met its duty to consult or accommodate in respect of rights recognized and affirmed by section 35; (d) whether the Project would be an infringement of potential or established Aboriginal or Treaty rights; and (e) any matter of Treaty interpretation (historic and modern). While the Review Panel will receive information about any potential adverse impacts of the Project on potential or established Aboriginal or Treaty rights and related interests, and may recommend mitigation measures to avoid or minimize those impacts, the scope of this mandate does not involve an ongoing dialogue with Aboriginal groups as is demonstrated by the prohibited issues identified above. The Review Panel has no authority to render conclusions regarding the extent to which the Project might infringe	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"Noted. The Terms of Reference has been amended to provide additional clarity about the role of the Review Panel and of the federal Crown in Section 3.7 which now reads* "Through these Terms of Reference, the Review Panel is given the mandate to collect information on behalf of the Crown as outlined in Section 3.9 to 3.11. The federal government maintains the duty to consult throughout the environmental assessment process and will be responsible for the items detailed in section 3.8, where necessary.""		

Stz'uminus First Nation

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
	Aboriginal or Treaty rights and does not have a mandate to consider accommodation measures beyond mitigation measures. Accordingly, the Crown must provide another forum for these critical issues to be addressed.				
STZ-8.3	Requested more information regarding how the noted constitutional issues will be decided, and at what stage of the process. Asked if, for example, the Crown will engage in consultation regarding accommodation measures other than Project mitigation measures during the Project review, or following the Review Panel's issuance of its report.	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"The Crown will request Aboriginal groups identify any outstanding impacts to potential or established Aboriginal or Treaty rights once the Review Panel's report has been made public and the Crown will consult as appropriate with Aboriginal groups on proposed measures for addressing outstanding impacts.* *Additional information on the integration of Aboriginal consultation into the environmental assessment (EA) process was provided to the Cowichan Nation Alliance with federal officials on November 27, 2014, and is available online in the "Aboriginal Consultation and EA Handout" http://www.ceaa-acee.gc.ca/050/documents/p80054/100180E.pdf and in the "Review Panel and Aboriginal Consultation Process Diagrams Handout" http://www.ceaa-acee.gc.ca/050/documents/p80054/100179E.pdf"*		
STZ-8.4	Emphasised the Crown's legal obligation to provide a clear and transparent outline of how Crown consultation will be undertaken. It is essential that a reasonable amount of time be provided for this process, and in light of the very brief prescribed timeline under which the Project review must proceed, it is essential that Crown consultation commence at an early stage. Stated that the Crown must recognise that the simple fact that the *CEAA 2012* prescribes that the Minister render a decision on the Project within 24 months from the day on which the environmental assessment was referred to the Review Panel (with the possibility of an additional three-month extension) cannot operate to terminate consultation where substantive issues remain to be discussed between the parties. Stated that it is difficult to imagine that the time set aside for post Review Panel report activities will be sufficient to undertake meaningful Crown- Aboriginal consultation.	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"The Crown intends for consultation to be ongoing throughout the entire EA process, and it will be integrated into the EA to the extent possible. We have heard key concerns from members of the Cowichan Nation Alliance and will consider them going forward.* *Additional information on the EA and consultation process is contained in the consultation work plan and handouts referenced in the response above. Issues of concern to Aboriginal groups that are outside the EA process, and any potential outstanding issues identified after the Review Panel report, should be identified and discussed with the Agency.* *Timelines for the federal government's administration of the EA are a legislated requirement under CEAA 2012. However the Agency strives to facilitate and accommodate the participation of Aboriginal groups whenever possible within these legislated timelines.* *Consultation is an ongoing dialogue between the Crown and Aboriginal groups, and should the Project be allowed to proceed subject to conditions in an EA decision statement, consultation with potentially impacted Aboriginal groups would carry on into the permitting phase and beyond depending on what, if any, issues remained outstanding at the time of the EA decision."*		
STZ-8.5	Commented that participation funding offered by the VFPA is insufficient. Requested further funding. Requested funding to support Follow-up Program discussions	12-Nov-14, Cowichan Nation Alliance EIS Workshop #2	**Cowichan Nation Alliance:** 09-Jan-2014: Offered funding for group Traditional Use study. 24-Apr-2014: Accepted funding for group Traditional Use study. **Stz'uminus First Nation:**	**Addressed in EIS Appendix 7.2-B (#19):** The VFPA has provided or offered funding support to ensure the ongoing participation of Indigenous groups involved in the Project's consultation processes. Additional agreements were also initiated to support the	**EIS** 7.0 Engagement and Consultation

Stz'uminus First Nation

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
		28-Aug-2014, Meeting with Cowichan Nation Alliance 29-Aug-2017, Follow Up Program Workshop with Cowichan Nation Alliance, Lyackson First Nation and Malahat First Nation	06-Jan-2014: Offered funding for participation in the consultation program. 20-May-2014: Accepted funding for participation in the consultation program. 22-Aug-2014: Offered funding for fall 2014 consultation activities. 03-Oct-2014: Accepted funding for fall 2014 consultation activities. 11-May-2015: Offered funding for participation in Project-related consultation activities including Marine Shipping study. 15-May-2015: Accepted funding for participation in Project-related consultation activities including Marine Shipping study. 07-Mar-2016: Offered funding to support ongoing involvement in consultation activities. 21-Apr-2016: Accepted funding to support ongoing involvement in consultation activities. 24-Oct-2017: Offered additional funding for participation in consultation activities for the RBT2 Project. 30-Oct-2017: Accepted additional funding for participation in consultation activities for the RBT2 Project.	development of studies regarding the Current Use. As a result of these engagement and consultation activities, Indigenous groups have provided traditional use information relating to the Project area. VFPA participation funding agreements have been negotiated between the VFPA and Indigenous groups, either individually or through associations representing the Indigenous groups. The VFPA has provided participation funding to 12 Indigenous groups or associations representing these groups: Tsawwassen First Nation; Musqueam First Nation; Semiahmoo First Nation; Tsleil-Waututh Nation; Cowichan Tribes; Penelakut Tribe; Halalt First Nation; Stz'uminus First Nation; Lake Cowichan First Nation; Lyackson First Nation; Metis Nation British Columbia; and Hwlitsum.	7.2 Aboriginal Engagement and Consultation Appendix 7.2-A Consultation Activities by Aboriginal Group Appendix 7.2-B Aboriginal Groups Interests and Issues Table
STZ-8.6	Stated that at the 2014 workshop the VFPA committed to providing responses to questions. Concerned that all questions are not being responded to. Referred to the difficulty of finding the answers to questions raised today from tens of thousands of pages of materials in the Environmental Impact Statement.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2 11-Dec-2014, Health & Aboriginal Rights Workshop – Cowichan Nation Alliance	**12-Nov-2014, Workshop:** Reiterated that the purpose of the meeting is to present the information available so far, and to get feedback. Acknowledged that not all of the questions posed today will be able to be immediately answered, but that they are being noted so as to be addressed and responded to. Referred to Appendix 7.2-B which will list all concerns raised, provide a response, and describe where to find additional information in the EIS. **11-Dec-2014, Workshop:** Responses to questions that have not yet been responded to will be included in the EIS, once assessment information has been finalised. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **06-May-2015, RBT2 EIS Orientation Workshop:** In response to this concern, the VFPA provided an EIS orientation presentation in order to provide an overview of the EIS and provide an opportunity for questions about the structure and organisation of the EIS. **19-Apr-2016, Letter from the VFPA to Stz'uminus First Nation:** Provided the notes from the following workshops: • 06-Jun-14 Aboriginal Groups Valued Components Workshop #1; • 03-Jul-14 Aboriginal Groups Valued Components Workshop #2; • 07-Oct-14 Aboriginal Groups Workshop #1; • 08-Oct-14 Aboriginal Groups Workshop #2; • 22-Oct-14 Cowichan Nation Alliance Workshop #1; • 28-Oct-14 Aboriginal Groups Workshop #3; • 29-Oct-14 Aboriginal Groups Workshop #4; and • 12-Nov-14 Cowichan Nation Alliance Workshop #2.	**Addressed in EIS Appendix 7.2-B:** All issues raised by Stz'uminus First Nation and responses provided by the VFPA can be found in EIS Appendix 7.2-B, including references to the specific sections in the EIS. **Additional information provided by the VFPA:** IR10-01 provides responses to all comments and concerns raised by all members of the Cowichan Nation Alliance regarding the Project and marine shipping from October 2012 up to December 31, 2017.	**EIS** Appendix 7.2-B Aboriginal Groups Issues and Interests Table **Information Requests** Response to Sufficiency Information Request #1 (IR10-01)

Stz'uminus First Nation

Table 9: Environmental Assessment and Permitting Process

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-9.1	Asked if it would be a harmonised process with the Province.	05-Mar-2013, Meeting with Cowichan Nation Alliance	**05-Mar-2013, Meeting:** Noted that the process has yet to be determined. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#8):** On November 5, 2014, the B.C. Environmental Assessment Office (EAO) confirmed the Project is reviewable under Part 8 of the Reviewable Projects Regulation, B.C. *Environmental Assessment Act*. On December 19, 2014, the B.C. Minister of Environment issued an order under s. 14 of the Act establishing the Province's procedures and methods for conducting the environmental assessment for the Project. The Minister ordered that the scope of the Project is as defined by the CEA Agency in the *EIS Guidelines*; the scope of the assessment must include factors established by the federal Minister and potential adverse environmental, economic, social, heritage, and health effects, including cumulative effects, and practicable means to mitigate such potential adverse environmental effects, and potential adverse effects on Indigenous groups; the EAO will principally rely on the environmental assessment to be conducted by the federal review panel and on consultation conducted by the CEA Agency with Indigenous groups, whose interests are potentially affected by the Project; and the EAO must make a recommendation to the Minister within 30 days of receiving notice of the decision from the federal Minister. The information presented in the EIS is intended to satisfy both federal and provincial environmental assessment requirements. More information regarding the federal environmental assessment for the Project can be found on the CEA Agency website at www.ceaa-acee.gc.ca, Reference Number: 80054. More information regarding the provincial environmental assessment for the Project can be found on the EAO's Project Information Centre (e-PIC) website at http://a100.gov.bc.ca/appsdata/epic/html/deploy/epic_project_home_410.html	**EIS** 6.0 Environmental Assessment and Permitting Process 6.2 Provincial Involvement and Process Appendix 7.2-B Aboriginal Groups Interests and Issues Table
STZ-9.2	Concerned that the EIS meets DFO standards not First Nation standards.	03-Jul-2014, Aboriginal Groups Valued Components Workshop #2	**03-Jul-2014:** Acknowledged the concern and stated that the Project team is trying to understand other perspectives and wants to make sure that we understand what the effects are to fisheries.	**Addressed in EIS Section 1.0:** The environmental assessment for the Project was developed to meet the requirements specified in the *EIS Guidelines* prepared by the CEA Agency. Indigenous groups have the opportunity to review the EIS and in that context, raise this comment to the CEA Agency and other agencies as appropriate.	**EIS** 1.1 Purpose of the Environmental Impact Statement
STZ-9.3	Noted that the draft Panel Terms of Reference is inconsistent with its reference to "Project". Stated that there are references to "project" and "designated Project". Recommended that all references to the proposed ... project be referred to as the "Project".	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"Your comment has been incorporated."*		
STZ-9.4	Stated that the draft Terms of Reference (ToR) should direct the Review Panel to explicitly assess potential Project impacts on Aboriginal and Treaty rights and culture. We note that the list of factors as set out at section 2.1 provides that the Review Panel must account for the "environmental	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"The Terms of Reference provide direction to the Review Panel regarding its role and mandate in conducting the EA. In* Part 3- Mandate of the Panel *in the Terms of Reference, direction has been provided to the*		

Stz'uminus First Nation

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
	effects" of the Project, of which term is defined at section 5(1) of the *CEAA 2012* to include effects to Aboriginal peoples and their use of lands and resources for traditional purposes; however, in light of the significance of potential impacts to Aboriginal and Treaty rights from the Project, a more direct reference in the list of factors is warranted.		*Review Panel on collecting information on behalf of the Crown as it relates to potential impacts of the project to potential or established Aboriginal or Treaty rights."*		
STZ-9.5	Stated that the draft ToR fails to provide explicit requirements and guidance for assessing socio-economic impacts in relation to Aboriginal people. Noted that the list of factors provides that the Review Panel must account for the "environmental effects" of the Project, which is defined at section 5(1) of the *CEAA 2012* to include health and socio- economic conditions; however we submit that the Review Panel would benefit from clear guidance on this issue.	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"The Agency is currently considering guidance on this topic."*		
STZ-9.6	Stated that it is essential that the Review Panel only recommend mitigation measures that are capable of achieving their stated purposes, and capable of demonstrating measurable success. Accordingly, Cowichan Nation Alliance recommended language that requires the Review Panel to put forward only those recommendations that are capable of demonstrating success in mitigating any significant adverse environmental effects. Recommended amendments to section 2.1 the draft ToR to address this concern.	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"Section 2.1 provides direction directly from CEAA 2012 and as mentioned above, the legislation provides clarity about what is meant by mitigation.* *The information related to the success of past project mitigation measures should be included in the EIS as discussed above.* *Your comment on possible environmental effects or impacts to potential or established Aboriginal or Treaty rights has been considered and language has been added to section 3.9 as it relates to the Review Panel's mandate in relation to Aboriginal consultation."*		
STZ-9.7	Stated that the scope of factors to be considered in the environmental assessment should not be limited by the content of the EIS guidelines. A review panel should give the requisite authority and discretion to decide for themselves the proper scope of the factors that they are considering, as this will fall under their expertise.	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"The purpose of the EIS Guidelines is for the proponent to identify the information requirements for the preparation of the EIS. The EIS Guidelines specify the nature, scope and extent of the information required for the EIS. Note that the EIS Guidelines set out the minimum information requirements – it is the proponent's responsibility to provide any additional information as required by the*		

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
	Recommended amendments to section 2.3 of the draft ToR to address this concern.		*Agency or the Review Panel, once it has been established, for the assessment of the environmental effects of the Project.* *Under CEAA 2012, the scope of the factors to be taken into account in the environmental assessment by the Review Panel are those in section 19(1)* a) *to* i)*. The Minister may require that any other matter relevant to the EA be taken into account by the Review Panel under section 19 (1)* j)*."*		
STZ-9.8	Stated that the Review Panel should not be limited to considering information provided solely by the participants – government agencies and departments may also have valuable information to contribute. Recommended amendments to Section 3.5 of the draft ToR to address this concern.	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"Your comment has been considered and Section 3.5 has been amended to direct that the "Review Panel shall accept as part of its record and review:" Federal authorities and government are already considered participants in the Review Panel process and henceforth covered by this Section."*		
STZ-9.9	Stated that Panel members should have knowledge or experience relevant to the anticipated impacts of the Project on Aboriginal and Treaty rights. Recommended amendments to section 4.1 of the draft ToR to address this concern.	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"Cowichan Nation Alliance members are welcome to submit potential panel candidates to the Agency. Panel Members must be unbiased and free from conflict of interest relative to the Project and have knowledge or experience relevant to the anticipated environmental effects of the project. Please provide suggested names and CVs to [provided contact information]."*		
STZ-9.10	Stated that it is critical that those parties that provide the Panel Members with support in a procedural, technical, administrative or advisory manner be unbiased and free from any conflict of interest relative to the Project and, where applicable, have knowledge or experience relevant to the anticipated environmental effects and impacts of the Project. Requested addition to the end of section 4.5: The Secretariat will be unbiased and free from conflict of interest relative to the Project.	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"Your proposed change has been made."*		
STZ-9.11	Requested addition to the end of section 4.18:	22-Sep-2014, Letter to the CEA Agency from	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):**		

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
	Any federal authority that assists the Review Panel will be unbiased and free from conflict of interest relative to the Project and will have knowledge or experience relevant to the anticipated environmental effects and impacts of the Project.	Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	*"Federal experts participate in environmental assessments in accordance with the mandate and areas of responsibility of their departments. Public servants are guided in their work and professional conduct by the Values and Ethics Code for the Public Service."*		
STZ-9.12	Stated that it is possible the Review Panel will not be capable of fulfilling its mandate and submit its report to the Minister within 14 months. Recommended that section 4.13 expressly confirm that the Review Panel must ultimately take the time that it requires to properly and completely discharge it mandate subject to the CEAA 2012, which allows the Minister to modify the statutory limits imposed on a review panel (CEAA 2012, subsection 38 (4)). Recommended amendments to section 4.13 of the draft ToR to address this concern.	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"CEAA 2012 has legislated timelines for the completion of an EA by Review Panel. The Review Panel must fulfill its mandate and provide a report to the Minister within the timelines set out in the legislation and as directed in the Terms of Reference."*		
STZ-9.13	Stated that the Review Panel should be required to give more than 30 days' notice of tis public hearing, as many participants must prepare and reschedule other commitments in order to participate. Accordingly, notice of a minimum of 90 days should be required. Stated that the timing and location of the public hearing is of critical importance to our communities; we require an opportunity to comment on the draft document setting out the schedule and location of public hearing prior to finalisation by the Review Panel. Recommended amendments to section 4.22 of the draft ToR to address this concern.	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"The Terms of Reference provides a minimum timeframe for the notice of the start of public hearings.* *The Review Panel is responsible for developing procedures for the conduct of the public hearing, including timing, location, format and other logistics. The Panel may, at its discretion, make draft hearing procedures available for comment.* *If members of the Cowichan Nation Alliance have suggestions on the timing or notification required for public hearings, they may provide that information to the Review Panel once it is established."*		
STZ-9.14	Stated that the draft ToR should direct the Review Panel to explicitly include their identification of potential impacts on Aboriginal and Treaty rights and culture in the report. Noted that the list of required coverage in the Review Panel's report includes an identification of	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"The Review Panel has been directed to collect and summarize information provided to it by Review Panel participants about any potential impacts on potential or established Aboriginal or Treaty rights in its report (section 3.10).*		

Stz'uminus First Nation

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
	those conclusions that relate to the environmental effects defined in section 5 of the CEAA 2012, which includes effects to aboriginal peoples and their use of lands and resources for traditional purposes; however, in light of the significance of potential impacts to Aboriginal and Treaty rights from the Project, a more direct reference to the list of required coverage for the report is warranted. Recommended amendments to section 4.27 of the draft ToR to address this concern.		*The Minister of the Environment has requested the Review Panel provide its conclusions and recommendations in relation to any environmental effects of the Project on Aboriginal people as set out in section 5 of CEAA 2012 as it is responsible for conducting the EA on the designated project.* *The Crown will maintain the duty to consult throughout the EA process and will conduct an assessment of what the potential project impacts are to the exercise of potential or established Aboriginal or Treaty rights. The Crown has already communicated the preliminary depth of consultation assessment letters dated January 7th, 2014 as referenced in the first response in this table.* *The Crown will communicate a revised depth of consultation assessment once the Review Panel has issued its report and is willing to discuss this assessment with Cowichan Nation Alliance members at this time. Cowichan Nation Alliance members are encouraged to raise any potential environmental effects, and/or impacts of the Project on potential or established Aboriginal or Treaty rights to the Review Panel to ensure the Crown has a robust understanding of your concerns at the point that the Review Panel issues its report."*		
STZ-9.15	Stated that section 4.28 obliges the Review Panel to include in its report "information it has received with respect to the justifiability of those significant adverse environmental effects". If the report is to recognise arguments that seek to justify significant adverse effects, the report must, as a matter of fairness and completeness, recognise arguments that such effects are not justified. Otherwise, the Minister will receive a biased report. Recommended amendments to section 4.28 of the draft ToR to address this concern.	22-Sep-2014, Letter to the CEA Agency from Cowichan Tribes on behalf of Cowichan Nation Alliance (CEAR Document #126)	**17-Apr-2015, Letter from the CEA Agency to Cowichan Tribes (CEAR Document #278):** *"Please see the additional clarity on justification related to likely significant adverse environmental effects added in Section 3.5 which states* "In accordance with sections 47 and 52 of CEAA 2012, if the Minister decides that the project is likely to cause significant adverse environmental effects, the Minister will refer the matter to the Governor in Council (Cabinet) who must decide whether those environmental effects are justified in the circumstances." *The Review Panel will not make the determination on whether likely significant adverse environmental effects may be justified, but if, taking into account the implementation of any mitigation measures, the Review Panel concludes that the project is likely to cause significant adverse environmental effects, the Panel may include in its report information that it has received with respect to whether those significant adverse environmental effects are justified in the circumstances."*

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-10.1	Asked if the lessons learned from eelgrass transplants that took place as part of Deltaport Third Berth have been taken into account for RBT2. Interested in and request information about the follow-up monitoring work that took place as part of Deltaport Third Berth.	22-Oct-2014, Cowichan Nation Alliance EIS Workshop #1	**22-Oct-2014, Workshop:** Responded that the VFPA recently hosted a workshop that brought together eelgrass experts from the west coast to share knowledge and experience. Noted that prior to 1986 there were a lot of challenges, but since then transplants have had a success rate of over 90%. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests, including concerns around cumulative effects, and provided the VFPA's responses. **29-Aug-2017, Follow Up Program Workshop with Cowichan Nation Alliance, Lyackson First Nation and Malahat First Nation:** The VFPA met with members of the Cowichan Nation Alliance to discuss the Follow-up Program and lessons learned from DP3.	**Addressed in EIS Appendix 7.2-B (#201):** Onsite eelgrass habitat creation is proposed through transplanting in an area approximating 3 ha. Based on the review of previous habitat creation programs (e.g., DP3), eelgrass transplants are considered to be an effective means of increasing productivity of marine vegetation. The VFPA will implement a Follow-up Program, which will include monitoring to confirm that all offsetting measures meet intended objectives and function as designed. Monitoring will include methods and success measures to confirm that offsetting measures have been effective. The *Fisheries Act* Authorization will require that functional objectives are met.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 17.0 Mitigation for Marine Biophysical Valued Components 17.3.2 Offsetting Potential Effects, Offsetting Framework 17.6 Mitigation for Marine Biophysical Valued Components, Monitoring and Reporting
STZ-10.2	Stated that no Aboriginal involvement with the Scientific Advisory Committee (SAC) and monitoring was a failure to consult with Aboriginal communities for the Deltaport Third Berth Project. Noted the SAC would be a good opportunity to have Aboriginal Traditional Knowledge included and to have First Nations input on the selection of committee members. Added "we would like engagement in the governance of the monitoring program."	29-Aug-2017, Follow Up Program Workshop with Cowichan Nation Alliance, Lyackson First Nation and Malahat First Nation	**29-Aug-2017, Workshop:** Noted input on governance for the Follow-up Program and stated that it will be considered in the planning for the RBT2 Follow-up Program governance structure for further discussion in future Follow-up Program meetings.	**Addressed response to in IR10-11:** The VFPA's response to IR10-11, as requested by the Review Panel, describes how Indigenous groups will be involved in the development, implementation, and management of the RBT2 Follow-up Program.	**Information Requests** Response to Sufficiency Information Request #11 (IR10-11)
STZ-10.3	Noted they never agreed with the VFPA assessment on level of impact and expect the impacts to be larger. Expressed concern with how the assessment was conducted by the VFPA's consultants. Stated that they want to see a third party environmental monitor involved in Follow-up Program implementation that is not involved in the original findings.	29-Aug-2017, Follow-up Program Workshop with Cowichan Nation Alliance, Lyackson First Nation and Malahat First Nation	**29-Aug-2017, Workshop:** The VFPA met with members of the Cowichan Nation Alliance to discuss the Follow-up Program and lessons learned from DP3. The VFPA sought input into the Program through asking the following questions at the workshop: • What is important to you (Cowichan Nation Alliance) and your community?;	**Additional information provided by the VFPA:** As a result of extensive studies and assessment, the VFPA is confident potential adverse effects can be fully or partially avoided or reduced through Project design and the implementation of environmental management programs. Where Project-related effects cannot be fully avoided or reduced, offsetting measures, such as the creation and enhancement of habitat, will be applied. **Addressed in EIS Section 33.5:** Similar to the Adaptive Management Strategy for DP3 as described in EIS Section 33.5, the VFPA is committed to developing and implementing a Follow-up Program for the Project. The purpose of the	**EIS** 33.5 Follow-up Program

Stz'uminus First Nation

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
	Suggested the monitoring program be separated from the VFPA jurisdiction		• What elements would you (Cowichan Nation Alliance) like to see monitored?; and • How would you (Cowichan Nation Alliance) like to be involved moving forward? Noted comments on monitoring and stated that they will be considered in Follow-up Program planning.	Follow-up Program is to verify the accuracy of residual effect predictions made in the EIS, and determine the effectiveness of any measures taken to mitigate the adverse environmental effects of the Project. To ensure the program's elements adequately reflect conditions of Project approvals, final designs, and construction or operation approaches, as well as public, Indigenous group, and regulator feedback received during the review of the EIS, the VFPA will lead the development of the Follow-up Program after the submission of the EIS. The Follow-up Program will include: • An evaluation of the adequacy of existing data to provide a benchmark against which to test Project-related effects; • A monitoring design drawing on the measurable parameters identified to be field-tested; • A methodological approach for using field-collected data to measure and verify the accuracy of the effects predicted in the EIS; • A reporting framework that defines frequency of reporting, distribution, and feedback mechanisms; and • Details of the VFPA's approach to adaptive management for the Project through construction and operation. The Follow-up Program will be developed in consultation with federal agencies, including the CEA Agency, DFO, and ECCC. Complete drafts of the RBT2 Follow-up Program will be made available prior to the start of field measurements to ensure parties consulted on the program and approving agencies have an opportunity to evaluate and approve the program. Feedback from Indigenous groups regarding the draft program will be sought through the VFPA's ongoing engagement initiatives.

Table 11: Human Health – Valued Component

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-11.1	Concerned about the determination that the Project is not expected to result in detectable effects on human health.	11-Dec-2014, Health & Aboriginal Rights Workshop - Cowichan Nation Alliance	**11-Dec-2014, Workshop:** Recorded comment for consideration by Project team. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#149):** The following are highlights of the human health assessment: • Seven potential mechanisms for human health effects were assessed: air emissions, noise and vibration, shellfish contamination, stress and annoyance, employment and income, food security, and health inequity. • Potential Project-related effects on human health are expected to be fully or partially mitigated through the implementation of environmental management plans and additional mitigation measures. • The Project is not expected to result in any significant adverse residual effects on human health. • The Project is not expected to result in measurable incremental residual cumulative effects to human health. With mitigation, all potential Project-related effects are expected to be negligible (not measurable), with the exception of residual effects on human health related to exposure to air emissions during construction, and exposure to noise during construction and operation. These effects are predicted to be not significant. A rationale for the determination is provided in EIS Section 27.0.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 8.0 Effects Assessment Methods 27.0 Human Health 27.6 Future Conditions with the Project – Potential Project-Related Effects 27.7 Mitigation Measures 27.8 Characterisation of Residual Effects and Context 27.9 Determination of Significance of Residual Adverse Effects

Table 12: Labour Market – Valued Component

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-12.1	Asked if the Project is expected to have a negative impact on any other types of employment.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014, Workshop:** Responded that the VFPA looked at labour market balance as an indicator, and conducted analyses to consider what the effect of the Project's employment and procurement would be, in relation to the availability of workers for other industries. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Section 19.0 Labour Market.	**Addressed in EIS Section 19.0:** The Project is expected to result in the following positive effects on the labour market in Metro Vancouver: • During the 5.5 year construction phase: o 4,150 person-years of direct employment, worth $494 million in wages; and o 9,724 person-years of total direct, indirect, and induced employment, worth approximately $824 million in wages. • During operation: o 835 person-years of annual direct employment connected to terminal operations, worth approximately $138 million in wages annually; o 1,412 person-years of annual total direct, indirect, and induced employment, worth $169 million in wages annually; o A slight lowering of the unemployment rate in Metro Vancouver; o A positive effect on the participation rate; and o A small boost to median incomes in Delta and Metro Vancouver. Training opportunities associated with construction and operation are anticipated to generate positive effects for the Project's direct workforce. Positive changes in employment and labour income are anticipated for the Indigenous population in Metro Vancouver during Project construction and operation. The Project is not expected to result in measurable adverse residual effects to the labour market.	**EIS** 19.0 Labour Market

Table 13: Light – Intermediate Component

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-13.1	Concerned that the light study did not consider the night sky with cloud cover as this increases the light effects over the water. Concerned about how the locations for monitoring light effects were selected, with specific reference to Galiano Island and Valdes Island.	22-Oct-2014, Cowichan Nation Alliance EIS Workshop #1	**22-Oct-2014, Workshop:** Responded that the assessment teams for visual resources and light are different. The team carrying out the light assessment work (at night) took a subset of the points of reception (PORs) from the visual resources (day) assessment, because there is less variation expected from point to point. Stated that for both the day and night assessments, PORs were concentrated in areas in closer proximity to the Project site. The POR on Valdes was added later through consultation. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#47):** Measurements of sky glow depend on the visibility of the stars, and were taken on nights with no or low cloud cover, where possible. The rationale for the assessment methods is included in EIS Section 9.4 and the technical report. The rationale for selection of the PORs is included in EIS Section 9.4. The light assessment included a POR on Galiano Island and on Valdes island. The measurements taken from, and predictions made for, these PORs are intended to be representative of surrounding areas.	**EIS** 9.0 Physical Setting 9.4 Light 9.4.2 Assessment Purpose and Approach 9.4.5 Methods Appendix 9.4-A Roberts Bank Terminal 2 Light Assessment Study, Study Methods Appendix 7.2-B Aboriginal Groups Interests and Issues Table
STZ-13.2	Asked if RBT2 would be subject to, or exempt from, Delta bylaws around light, and if not, whether the VFPA would be willing to meet or match their requirements anyway.	22-Oct-2014, Cowichan Nation Alliance EIS Workshop #1	**22-Oct-2014, Workshop:** Recorded comment for consideration by the Project team. Post meeting note shared with Cowichan Nation Alliance in draft meeting notes: There are not any standards or bylaws for light such as there are for noise, for example. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#99 and #45):** A process is underway to change the current outdoor lighting fixtures at the Deltaport Terminal to light-emitting diodes (LEDs). LEDs are more directional and easier to control in terms of where light is focused. It is anticipated that the change to LEDs will reduce both light trespass and sky glow from the Deltaport Terminal, provided good lighting design practices are followed (specifically, the use of full cut-off light fixtures to limit up-light and only lighting areas that are required to be lit). The lighting on one crane at Deltaport has been fully replaced with LED lights, offering a point of comparison with the older lights. **Addressed in EIS Section 33.0:** The Light Management Plans for construction and operation phases will be developed prior to the respective phases. The Light Management Plans will describe measures to reduce excess lighting and sky glow, including: • Orienting lights downwards and away from residential and marine areas; • Using shielding to minimise light trespass; • Controlling light levels and limiting light use to areas where activities are occurring; • Where possible, using fixtures that emit light at wavelengths shown to minimise disorienting effects to birds; • During construction, ensuring dredge lighting system shields light from spilling outside the basic working footprint of the dredge; and • During operation, establishing a centralised lighting control system to select lighting where required. Feedback on applicable environmental management plan sub-plans will be solicited from Indigenous groups potentially affected by the Project.	**EIS** 9.0 Physical Setting 9.4 Light 9.4.4 Relevant Guidelines Appendix 9.4-A Roberts Bank Terminal 2 Light Assessment Study Appendix 7.2-B Aboriginal Groups Interests and Issues Table 33.0 Environmental Management Program

Table 14: Marine Commercial Use – Valued Component

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-14.1	Concerned that the Project could negatively impact fishermen and their livelihoods.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014, Workshop:** Presented information on the preliminary assessment of potential Project effects and cumulative effects on Commercial, Recreational, Aboriginal (CRA) Fisheries and any proposed mitigation, as well as receive feedback on the draft findings and proposed mitigation. The presentation includes: executive summary, sub-components, indicators, assessment boundaries, the local and regional assessment areas, information sources, an overview of each of the fisheries (CRA), existing conditions for Pacific Salmon, Groundfish, Forage Fish, and Shellfish, expected conditions at Project commencement, potential Project-related effects, proposed mitigation measures, anticipated residual effects, the preliminary determination of significance, and anticipated cumulative effects. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#117):** Marine commercial use, or the use of marine waters and resources to generate revenue, has been identified as an important economic factor in local and regional communities, and for Indigenous groups. The marine commercial use assessment included four sub-components: • Seafood harvesting; • Marine fish harvesting; • Guided sport fishing; and • Marine-based tourism. Potential effects on marine commercial use include displacement of commercial crab harvesting during construction and operation, resulting in a potential change of harvesting area, total harvest, and revenue, due to the Project footprint and the proposed expansion of the area closed to commercial crabbing. The VFPA will work with DFO to engage commercial crab harvesters to identify and implement feasible mitigation measures; and will implement construction and operation environmental management plans related to construction phase communication, construction monitoring, and crab salvages effects from displacement of commercial crab harvesting during construction and operations. The Project is anticipated to result in a negligible effect to marine fish harvesting, guided sport fishing, and marine-based tourism. These negligible effects are related to changes in area, access, resource availability, and harvesting revenues. The Project is expected to result in a residual effect of changes to seafood harvesting area, harvest, and revenue. The residual effect is determined to be not significant, as Dungeness crab are known to move substantial distances to baited traps, and harvest activity can be moved to another open area. Other planned or reasonably foreseeable projects and activities would also displace crab harvesting, and this effect would combine with that of the Project to result in an incremental cumulative effect on commercial crab fishing. This adverse incremental cumulative effect is determined to be not significant.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 12.0 Marine Invertebrates 16.0 Ongoing Productivity of Commercial, Recreational, and Aboriginal Fisheries 21.0 Marine Commercial Use 21.6 Future Conditions with the Project – Potential Project-related Effects 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes 32.2.6 Future Conditions With the Project - Potential Project-related Effects

Table 15: Marine Fish – Valued Component

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-15.1	Concerned that the Project will affect migrating salmon that return from the South to the Fraser River through Canoe Passage. Concerned about mitigation for natural migration patterns that are in the Project area and the impacts to salmon being made that we do not understand yet along with other animal's natural migration.	03-Jul-2014, Aboriginal Groups Valued Components Workshop #2 22-Oct-2014, Cowichan Nation Alliance EIS Workshop #1	**03-Jul-2014, Workshop:** Responded that the Regional Study Area has been extended to Hope, which will capture a large portion of that migration and that is actually where the DFO sub-areas stop. Stated that a real effort was made to capture some, if not all, of the migration. Stated that sockeye hold more in the North arm and South arm, but that there are species of Chinook and chum that hold around Canoe Passage, so that area is being included. Canoe Passage is a fairly small distributary of the Fraser but there is still holding there. Sockeye in particular are coming out and heading north, with the exception of the Harrison Lake stock, which DFO thinks might be migrating south. **22-Oct-2014, Workshop:** Responded that the options for onsite habitat mitigation do consider fish passage. The primary intent is to soften the shoreline to make it more amenable to salmonid use. Stated that juvenile salmon use eelgrass beds and tidal marsh habitat. Stated that the mitigation measures primarily consider juvenile salmon outmigration and rearing. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#78):** Field studies, air photo review, and modelling were undertaken during the coastal geomorphology assessment at Roberts Bank, including Canoe Passage. Changes are anticipated around the terminal and within the intertidal zone shoreward of the terminal. The potential effects of these changes on marine fish are considered in the EIS. An assessment was undertaken to determine the effects of the Project on the productivity of marine fish, including Pacific salmon. The assessment of marine fish, as well as marine vegetation and invertebrates upon which fish depend, consider seasonal influences, and potential Project-related changes on these influences. Terminal footprint-related changes to coastal process such as currents and freshwater-marine water mixing near and shoreward of the terminal are anticipated. Project-related changes in salinity and turbidity are discussed with respect to marine water quality. A discussion of the potential effects of these changes on marine fish, including different fish life stages, is presented in the marine fish assessment. **Addressed in EIS Section 13.6.3.1:** The potential effect on the migration behaviour of juvenile salmon from terminal placement and causeway widening was assessed qualitatively. Two effects mechanisms—changes in the light environment and changes in habitat availability—were considered to have the potential to influence migration behaviour of juvenile salmon and result in a minor decrease of juvenile salmon productivity pre-mitigation. With implementation of mitigation measures, including adherence to juvenile salmon fisheries-sensitive window, implementation of a light management plan, as well as offsetting in the form of onsite native eelgrass transplants and reconstructed tidal marsh habitats north of the widened causeway, migration-related changes in juvenile salmon productivity were assessed as negligible. **Addressed in responses to IR5-18 and IR5-22:** Further discussions about terminal placement's potential effects on the migratory behaviour of juvenile salmon is available in the VFPA's responses to IR5-18 and IR5-22.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 9.0 Physical Setting 9.5 Coastal Geomorphology 9.5.8 Future Conditions with the Project 9.7 Marine Water Quality 9.7.8 Future Conditions with the Project 13.0 Marine Fish 13.6 Future Conditions with the Project 13.6.3 Potential Effect - Changes in Productivity Table 13-6 Desktop and Field Studies Related to Marine Fish to Support the Assessment Table 13-10 Summary of Roberts Bank Ecosystem Model Productivity Results for Marine Fish **Information Requests** Response to Sufficiency Information Request #18 (IR5-18 of CEAR Document #1153) Response to Sufficiency Information Request #22 (IR5-22 of CEAR Document #1153)
STZ-15.2	Stated that sockeye salmon have not been assessed in the EIS and is an information gap. Stated that the Cowichan Nation Alliance is not satisfied with the explanation provided as to why sockeye is excluded from the assessment. Stated that field studies were conducted at the wrong time of the year.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2 11-Dec-2014, Health & Aboriginal Rights Workshop – Cowichan Nation Alliance 29-Aug-2017, Follow Up	**12-Nov-2014, Workshop:** Responded that the VCs were defined based on the findings of the fieldwork. Referred to trawls being done in the area to determine what species are present in the area; different species can occur in the area, but Chinook and chum have more of a presence. Responded that the VFPA understands the importance of the species (sockeye) and more details specific to sockeye can be provided. **11-Dec-2014, Workshop:**	**Addressed in EIS Appendix 7.2-B (#107):** Sockeye salmon was not selected as a representative species within the Pacific salmon sub-component, as studies indicate that juvenile sockeye salmon do not use the Roberts Bank area in high abundance, relative to chum and Chinook salmon (which have been selected as representative species in the assessment). Since chum and Chinook are the most estuarine-dependent species of salmon, the potential for Project-related interactions with these species is greatest. Results of the assessment based on these two species represent a more conservative approach, given the life histories and habitat use of chum and Chinook. Therefore, potential Project-related effects on sockeye salmon are considered	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 9.0 Physical Setting 9.5 Coastal Geomorphology 9.5.8 Future Conditions with the Project 9.7 Marine Water Quality 9.7.8 Future Conditions with the Project

Stz'uminus First Nation

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
	Concerned that there will be negative impacts on sockeye as a result of the Project. Stressed the importance of sockeye to the Cowichan Nation Alliance. Requested for peer review of the work pertaining to sockeye. Reiterated their concerns regarding the impact of the Project on migrating fish and disagreement that the VPFA consultants did not find evidence of sockeye salmon in the local assessment area.	Program Workshop with Cowichan Nation Alliance, Lyackson First Nation and Malahat First Nation	Responded that the VFPA thought more information about how sockeye had been considered had been provided to the Cowichan Nation Alliance, and apologised if they have not yet received anything. The EIS will describe more fully how salmon have been assessed. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **29-Aug-2017, Workshop:** Noted concerns regarding fish, and will include this as ongoing topic for further discussion on representative species and ways to address concerns raised.	within the assessment through the assessment on the sub-component Pacific salmon, as represented by chum and Chinook. **Additional information provided by the VFPA:** Minor decreases in productivity are anticipated during the construction and operation phases for all marine fish sub-components, with the exceptions of negligible changes in productivity for certain species, including adult Chinook and chum salmon (representative species for sockeye and other Pacific salmon species) and lingcod, and an increase in productivity for shiner perch during the operation phase. Productivity decreases can be partially mitigated through the implementation of environmental management plans and the creation of habitat. Residual effects are anticipated for flatfish and forage fish as a result of permanent loss of subtidal sand habitat associated with the terminal footprint and disturbance from underwater noise. The assessment concludes there are no significant adverse effects from the Project, as marine fish productivity or long-term integrity would not be compromised. The Project is not expected to result in measurable incremental adverse cumulative effects to marine fish. Sockeye salmon are considered in the assessment of marine commercial use as the primary species of salmon sought in the assessment area. The economic component of sockeye fishing is addressed in EIS Section 21.0. A field sampling program for salmon was conducted at Roberts Bank in 2012 and 2013. While it is possible that 2012 to 2013 seasonal surveying for the Project did not capture all salmon species present at Roberts Bank, historical survey data add to the weight of evidence, suggesting a realistic representation of species composition and abundance at Roberts Bank. **Addressed in responses to IR5-15 and AIR-12.04.15-09:** In its response to IR5-15, the VFPA specifically discusses existing conditions related to sockeye salmon and describes the status and management practices associated with the species. Rationale as to how sockeye salmon were assessed via use of Chinook and chum as representative species, as well as similarities between species as they pertain to existing conditions (e.g., life history and habitat requirements), the mechanisms through which the Project may affect sockeye, as well as effectiveness of mitigation, are presented in the VFPA's response to AIR-12.04.15-09, including Appendix AIR9-A Table 2; and in the VFPA's response to IR5-15. **Addressed in EIS Section 13.3:** The marine fish LAA encompasses an area of approximately 5,416 ha. In determining LAA boundaries, consideration was given to the nature and characteristics of marine fish, and potential exposure of marine fish to various Project influences (e.g., total suspended solids (TSS), sedimentation, and underwater sound levels). Also taken into account were social and cultural considerations, such as community knowledge and ITK, and current land and resource use by Indigenous groups and others. The RAA, which covers an area of approximately 52,456 ha, was established to provide a regional context for the assessment of Project-related effects. The RAA was also established to encompass the area within which the residual effects of the Project on marine fish may	13.0 Marine Fish 13.2 Selection of Marine Fish Valued Component 13.3.1 Spatial Boundaries 13.4.1 Information Sources, Desktop and Field Studies 13.5.1 Existing Conditions, Pacific Salmon 13.6 Future Conditions with the Project Table 13-6 Desktop and Field Studies Related to Marine Fish to Support the Assessment Table 13-10 Summary of Roberts Bank Ecosystem Model Productivity Results for Marine Fish 13.6.3 Potential Effect - Changes in Productivity **Information Requests** Response to Additional Information Request #09 (AIR-12.04.15-09 of CEAR Document #388) Response to Sufficiency Information Request #15 (IR5-15 of CEAR Document #1078)

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
				combine with the effects of other projects and activities to potentially result in a cumulative effect. Marine and freshwater RAA boundaries were determined based on DFO Pacific Fisheries Management Area limits (see EIS Figure 12-3).	
STZ-15.3	Stated that the EIS should consider salmon pooling at the mouth of the Fraser River and investigate Project-related impacts on sockeye salmon in this area. Stated that fishermen report that Canoe Pass is an important holding area for sockeye.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014, Workshop:** Recorded comment for consideration by Project team. Referred to trawls being done in the area to determine what species are present in the area; different species can occur in the area, but chinook and chum have more of a presence. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Section 13.0:** While there is evidence that adult sockeye pass through the estuary annually en route to the Fraser River to spawn, available information indicates that most stocks enter the Fraser River with little or no delay (i.e., perhaps one day); hence, any potential interaction between the Project and migrating or passing individual adult sockeye salmon would be limited to approximately several days per year. A potential exception is a portion of the late-run timing group, which typically holds in the outer estuary for several weeks prior to starting upriver migration; however, since 1995, large segments of the late-run sockeye have ceased their holding behaviour and entered the Fraser River three to six weeks earlier than historically observed. As noted in EIS Section 13.2.1, there is no scientific evidence that waters at or near Roberts Bank represent holding areas for adult sockeye. **Addressed in response to IR5-15:** In its response to IR5-15, the VFPA specifically discusses existing conditions related to sockeye and describes the status and management practices associated with the species. The response also further assesses potential effects of the Project on sockeye directly. As further described in the response to IR5-15, based on existing literature, there is no formally defined holding area within the Fraser River estuary for returning adult sockeye. It appears that the brackish layer or plume within which adult sockeye may hold can extend as far north as Gibsons Landing, as far west and south as the Gulf Islands (from Gabriola Island near Nanaimo to Saturna Island at Boundary Passage), and as far east at Point Roberts area. However, since 1995, sockeye holding behaviour appears to have ceased.	**EIS** 13.0 Marine Fish **Information Requests** Response to Sufficiency Information Request #15 (IR5-15 of CEAR Document #1078)
STZ-15.4	Asked why people have not been included as one of the species that eats chum salmon in the food web example (slides 12-13, Marine Fish Presentation at 2014 Cowichan Nation Alliance Workshop #2).	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014:** Responded that the approach undertaken seeks to understand the ecosystem from a natural perspective, and human interactions are addressed in a different way. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#101):** The Roberts Bank ecosystem model is described in the EIS. The model incorporated predator-prey relationships (biotic factors) and environmental factors within the marine environment, and does not incorporate anthropogenic influences such as fishing. Since changes are determined by comparing productivity in the future with the Project, to the future without the Project, the level of human influence is deemed to be the same with and without the Project, and humans are not included in the food web. However, the existing conditions for species included in the model are reflective of existing harvesting levels by humans; therefore, human interaction within the model is implicit. **Addressed in response to IR3-09:** Dungeness crab fishing at Roberts Bank was investigated using the Roberts Bank ecosystem model in the VFPA's response to IR3-09. Salmon harvesting was not considered, because salmon harvesting occurs over large geographic areas, with only a small proportion of the salmon catch coming from areas in the periphery of or adjacent to Roberts Bank. As such, salmon fishing was considered unlikely to influence model results. Results from the Roberts Bank ecosystem model re-run showed that when Dungeness crab fishing was	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 10.0 Biophysical Setting 10.3 Overview of Assessing Ecosystem Productivity Appendix 10.3-A Roberts Bank Ecopath with Ecosim and Ecospace Model Parameter Estimates Appendix 10.3-B Roberts Bank Ecosystem Model Development and Key Run Appendix 10.3-C Roberts Bank Spatial Ecosystem Model Sensitivity Analysis

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
				considered, results were generally the same when compared to those described in the EIS.	Appendix 10-D Roberts Bank Spatial Ecosystem Model Sensitivity Analysis **Information Requests** Response to Sufficiency Information Request #09 (IR3-09 of CEAR Document #984)
STZ-15.5	Concerned that a spill could travel into mouth of Fraser River and impact migratory salmon species.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014, Workshop:** Recorded comment for consideration by Project team. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses.	**Addressed in Appendix 7.2-B (#185):** The Project is not located on the Fraser River and no Project-related effects are predicted on the Fraser River.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 30.0 Potential Accidents or Malfunctions Appendix 30-A Marine Vessel Incidence Prediction Inputs to the Quantitative Risk Assessment Appendix B - Tables
STZ-15.6	Asked whether fish are being redirected away from Canoe Pass because of ships and whether that impact will increase with RBT2.	01-Nov-2013, Meeting with Cowichan Nation Alliance	**01-Nov-2013, Meeting:** Responded that potential effects on marine fish migration behaviour from changes in the light environment and changes in habitat availability are assessed in the EIS. With mitigation, including implementation of a light management plan, and onsite offsetting in the form of eelgrass transplants and tidal marsh creation, changes in productivity of marine fish associated with these rearing habitats is assessed as negligible **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Section 8.1 on Marine Fish.	**Additional information provided by the VFPA:** There is no known evidence that existing shipping activity is affecting movement patterns of fish at Roberts Bank. In MSA Section 8.1, potential effects of underwater noise were considered to be negligible because noise generated by Project-associated marine vessel activity and future cumulative shipping activities would not exceed injury thresholds for fish species or the Pacific salmon species behavioural threshold. Further, while noise-induced behavioural changes are possible for Pacific herring, potential effects would be localised to within 20 m of a container ship and of short duration (as the ship passes by) and are therefore not anticipated to affect the integrity of populations within the LAA. **Further information provided by the VFPA:** **07-Jan-2014, Letter from the VFPA to Penelakut Tribe:** A review of historical and recent air photos, in addition to modelling of sediment deposition at Roberts Bank (including Canoe Passage) is underway. Historic Canoe Passage discharge channel locations and sediment distribution (e.g., bar formation or build-up of sand) will be documented to assess natural variation pre- and post-terminal construction, and potential changes as a result of the proposed terminal configuration will be assessed. Fish and fish habitat suitability studies are currently underway to assess current fish distribution and abundance, and potential changes in fish presence as a result of the proposed Project will be assessed. Potential changes resulting from the Project during both construction and operations phases will be included in the assessment.	**MSA** 8.1 Marine Fish

Stz'uminus First Nation

Table 16: Marine Invertebrates – Valued Component

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-16.1	Concerned about effects on crabs, particularly in relation to black material observed in crabs harvested in the area. Crab harvesting in the RBT2 Project area results in black (coal polluted crabs), which are not edible. Asked how the VFPA can remediate lands first to deal with coal.	01-Nov-2013, Meeting with Cowichan Nation Alliance 12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**01-Nov-2013, Meeting:** Responded that crabs are part of the baselines studies and the VFPA is looking at current conditions of the baseline studies. **12-Nov-2014, Workshop:** Referred to the black crab study being carried out separately from the environmental assessment. Two black crab samples have been collected, and are currently waiting to be tested. The VFPA will be able to provide an update once that has happened. Tsawwassen First Nation collected the crab samples for this study. **07-Aug-2014, Email from the VFPA to Stz'uminus First Nation:** Provided information on a study that the VFPA is undertaking related to black material observed in Dungeness crabs previously harvested from the Fraser River estuary. This black material has been noticed by Tsawwassen and Musqueam First Nation crabbers in DFO Fisheries Management Areas 28 and 29 and as such we are working with these communities in the collection of crabs for testing. Provided details on the purpose, methodology, study area, and timeframe. **09-Jul-2015, Email from the VFPA to Stz'uminus First Nation:** Followed up to previous communications and the Dungeness Crab field study notification of August 2014. Attached a letter and memorandum regarding the studies undertaken by Hemmera in response to reports from Indigenous groups to the VFPA regarding blackening of Dungeness crab and concerns related to potential contamination. The memo included a summary of findings. The results of both studies were the same: • There is no evidence of coal contamination, based on the results of sensitive tissue chemistry analysis testing for PAHs, metals, and trace elements; • Consumption risks are acceptably low and pose no risk to human health; and • The underlying cause of the blackened shells is determined to be shell disease (a common condition due to bacterial infection of existing lesions/damage in the crab shells). **12-Apr-2018, Letter from the VFPA to Stz'uminus First Nation:** Stated that since concerns were raised, the Project team has conducted further work on these topics to	**Addressed in EIS Section 27.0 and EIS Appendix 27-C:** Addresses potential effects of contaminant-related consumption risks of Dungeness crab, where contaminant analysis of crab tissue and the completion of a human health risk assessment was completed to support the development of the RBT2 environmental assessment. The leg muscle tissue did not contain detectable PAH concentrations, in spite of the use of sensitive laboratory analytical methods. Only arsenic was present in concentrations of potential concern and, consequently, was carried forward in a quantitative human health risk assessment; it was concluded that arsenic-associated health risks from the consumption of Dungeness crab tissue are acceptably low. A second study paralleled the above in terms of methods and analysis, but involved collaboration with Indigenous groups to provide samples of crabs as well microscopic examination of the tissue structures (i.e., histologic) of blackened areas. Again, results yielded no evidence of crab contamination related to coal dust, based on sensitive tissue chemistry analysis testing for PAHs, metals, and trace elements. Results of microscopic examination point to localised physical damage of the exoskeleton and the bacterial shell disease as the underlying cause of blackening. **Addressed in EIS Appendix 7.2-B (#74):** Potential Project-related effects on Dungeness crabs are described in the EIS. An Edible Shellfish Study was undertaken to quantify bivalve shellfish and Dungeness crab soft tissue contaminant concentrations. The results of this study are provided in the EIS in the marine invertebrates and human health sections. In late 2014, samples of crab were collected by Indigenous crab harvesters concerned about contamination, and the VFPA has submitted these for tissue testing for various substances of concern, including PAHs, metals, and fungus. Preliminary observational results indicate that the causes of black colouration of crabs is consistent with shell disease, and not likely related to contamination from coal dust (EIS Appendix 27-C, Section 4.76). The detailed results of laboratory tests will be shared with Indigenous groups when available.	**EIS** 12.0 Marine Invertebrates 12.4.1 Desktop and Field Studies Table 12-4 Marine Invertebrates Studies to Support the Assessment 12.5.3 Existing Conditions, Dungeness Crabs 12.6.2 Future Conditions with the Project, Negligible Effects 27.0 Human Health 27.6.4 Potential Effect # 3 – Adverse Health Effects due to Stress and Annoyance - Perceived Contamination Appendix 27-C Shellfish Harvesting Potential and Contaminant-related Consumption Risks at Roberts Bank **Information Requests** Response to Sufficiency Information Request #33 (IR4-33 of CEAR Document #1078) Response to Sufficiency Information Request #34 (IR4-34 of CEAR Document #946) **Memorandum Re: Summary Report – Roberts Bank Dungeness Crab Health Studies**

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
			respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the following documents review: • IR4-33 - Crab Hepatopancreas Additional Study Summary; and • IR4-34 - Black Crab Additional Studies Summary. Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.	**Addressed in responses to IR4-33 and IR4-34:** Further information concerning the VFPA's investigations into 'blackened' crabs is provided in the response to IR4-34. In summary, black lesions were observed on four of the five crabs collected by Indigenous harvesters. The black lesions were concluded to be consistent with chitinolytic shell disease, generically referred to as 'shell disease', a condition common to crab and other crustaceans. This disease is caused by a bacterial or fungal infection of an area where the outer layer of the shell has been previously damaged. Shell disease has not been linked to contamination. The disease is not specific to the Roberts Bank area and is present across the Pacific Northwest, including Alaska and B.C. and in Atlantic Canada. In its response to IR4-33, the VFPA provided results of the study. In summary: A crab hepatopancreas study was conducted at Roberts Bank to determine the concentrations of contaminants of concern in crab hepatopancreas in the LAA. In June 2017, Dungeness crab were collected from five traps placed at each of the three study locations (15 traps total). Twelve adult male crabs were harvested from each of the three sites (36 crab total). Samples were submitted under chain of custody to analytical laboratories accredited by the Canadian Association for Laboratory Accreditation (CALA) for the analysis requested. The analysis was completed in August 2017. Collectively, the results of a statistical comparison across sites indicate that the average concentrations of PCBs, coal indicator elements, arsenic compounds, and PAHs measured in hepatopancreas from crab collected from the RBT2 and ITP sites are not statistically higher than those measured in crab from the Canoe Passage reference site. This suggests that existing sediment and water quality in and around the existing terminal and proposed RBT2 terminal are not contributing to contaminant concentrations in crab hepatopancreas that are higher than levels found in crab hepatopancreas from the Canoe Passage reference site. **Further information provided by the VFPA:** **07-Jan-2014, Letter from the VFPA to Penelakut Tribe:** The proposed Project is being designed to exclusively handle containers. There will not be an increase in coal shipments as a result of the Project. The VFPA has undertaken shellfish	

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
				studies in the Roberts Bank area to assess contamination, and proposes to study crab tissues to assess whether the black material is coal dust, a fungus, or other substance.	
STZ-16.2	Requested more information on sea pens. Asked what is known about the impact and role of orange sea pens in the area. Asked what the per cent decrease in productivity is expected to be. Asked if the orange sea pen test transplant area has been determined yet to be either successful or unsuccessful. Concerned with the impact of a loss of sea pens on habitat and other species.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014, Workshop:** Stated that sea pens are known to exist in the area; however, from a scientific and ecological perspective, they are poorly understood. The first studies were done in 2002-2003, and more field studies were more recently undertaken in 2011 using an underwater remote vehicle. Additional recent studies have included people going underwater to count sea pens, to map their distribution, and to identify other species associated with them. One study sought to understand them better in the context of water flows and sediments and other studies looked at transplanting sea pens. If the transplant was not viable or unreliable, the effects would be characterised in a worst-case scenario. In this current status of the assessment, it is anticipated that there will be a moderate impact on the orange sea pens in the area if transplanting is unsuccessful. **07-Feb-2018, Email from the VFPA to Stz'uminus First Nation:** "Starting in 2014, the Project team conducted a pilot study to test a method for transplanting orange sea pens, which involved the transplant of 1,200 orange sea pens to three sites within the LAA for the Project. Please find attached a report titled *Orange Sea Pen Transplant Pilot and Monitoring Program*. The results of the study show that the pilot sea pen transplant was successful, with stable densities and evidence of recruitment at two of the three transplant sites. This report will be submitted to the Review Panel shortly with the VFPA's response to IR5-05."	**Addressed in EIS Section 12.0:** As noted in EIS Section 12.0, the VFPA stated that the proposed Project would result in a moderate reduction in orange sea pen productivity, and that the level of confidence in this assessment was considered to be moderate. **Addressed in response to IR-7.31.15-24:** The VFPA's response to IR-7.31.15-24 presents the inter-relations between orange sea pens and other marine species and the predicted effects to other marine species from the Project-related loss of orange sea pen habitat. **Addressed in response to IR5-05:** The VFPA's response to IR5-05 provides the Orange Sea Pen Transplant Pilot and Monitoring Program report (Appendix IR5-05-A). In summary, the pilot sea pen transplant was successful. Stable densities, and evidence of recruitment, at two of the three transplant sites demonstrate that not only can environmental conditions successfully be used to predict habitat suitability for orange sea pens across a larger study area, but also attests to the ecological viability of transplantation as a potential mitigation method. **Addressed in response to IR5-06:** The VFPA's response to IR5-06 discusses the confidence in the effect rating for orange sea pens. In summary, the moderate confidence ranking was rooted in four main points (each of which are described below): • The success of the orange sea pen pilot transplant and monitoring program (see IR5-05); • Remaining orange sea pen productivity with the Project (before mitigation) is considerable (45%) such that the population will persist at Roberts Bank; • Reproductive and larval biological characteristics of orange sea pens, which confer a high ability to replenish stocks; and • Coral transplants are common and successful elsewhere. **Addressed in response to IR5-07:** The VFPA's response to IR5-07 provides an assessment of the potential ecological effects on other components of the environment such as marine invertebrates and marine fish resulting from a decrease in the orange sea pen population	**EIS** 12.0 Marine Invertebrates **Information Requests** Response to Information Request #24 (IR-7.31.15-24 of CEAR Document #314) Response to Sufficiency Information Request #05 (IR5-05 of CEAR Document #1145) Response to Sufficiency Information Request #06 (IR5-06 of CEAR Document #1145) Response to Sufficiency Information Request #07 (IR5-07 of CEAR Document #1145)

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
				due to the proposed Project activities. As noted in the response to IR5-07, the conclusion of no significant effects to marine invertebrates and fish remain unchanged.	
STZ-16.3	Referred to the food webs showing biomass in the future with and without the Project (slides 17-18 of Marine Invertebrates presentation at Cowichan Nation Alliance Workshop #2), and the bubbles changing in size. Requested the exact number of anticipated change for each of the species.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014, Workshop:** Recorded comment for consideration. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included information on the biophysical setting in Section 10.0.	**Addressed in EIS Section 10.0:** The VFPA used an ecosystem-based approach to assess Project-related effects to the productivity of marine biophysical VCs. Modelling of ecosystem productivity was one of several tools used to inform effects assessments. Productivity is a measure of the amount of plant and animal biological material (or biomass) produced within an area over a given amount of time. A predator-prey food web for the Roberts Bank ecosystem was developed to represent the linkages and interactions between marine vegetation, invertebrates, fish, mammals, and coastal bird species that influence the productivity of the ecosystem. The model calculates productivity changes to 58 functional groups to represent the complex interactions of this ecosystem; productivity changes to each of these groups calculated by the model are presented in EIS Appendix 10-C. The results are presented as changes to biomass in the groups, not species' abundance (number of individuals). The model was also used to predict the productivity of proposed on-site habitat that would be created to offset expected Project-related effects on the productivity of marine biophysical VCs.	**EIS** 10.0 Biophysical Setting Appendix 10-C Roberts Bank Ecosystem Model Development and Key Run
STZ-16.4	Concerned with the potential for RBT2 to constrain crabbing areas. Stated that fishing will be confined to a smaller area and there is concern regarding crowding. Stated that their use of the Roberts Bank area has increased recently because crabs in proximity to Penelakut are contaminated by the Crofton Mill. Stated that they rely on crab taken from the RBT2 area to support its food, social and ceremonial fishery and its traditional way of life.	17-Jun-2015, Meeting with Cowichan Nation Alliance	**17-Jun-2015, Meeting:** Recorded comment for consideration by Project team. **28-Jul-2016, Issues Workshop – Island Nations:** The VFPA hosted an issues workshop where concerns raised about project impacts to crab were discussed along with proposed mitigation measures. Explained that the EIS section for current use/rights considers the navigational closure area. FSC harvesters can access this closure area to crab without floats; commercial and other harvesters cannot. That closure area would be expanded to accommodate the new terminal and would increase in size. The idea would be that VFPA would work with DFO to continue the practice to only allow FSC crabbing within that area. We also have identified other consultation mechanisms to continue engagement with Aboriginal groups regarding monitoring/follow up programs regarding resources relied upon by Aboriginal groups. We have	**Addressed in EIS Appendix 7.2-B (#117):** Marine commercial use, or the use of marine waters and resources to generate revenue, has been identified as an important economic factor in local and regional communities, and for Indigenous groups. The marine commercial use assessment included four sub-components: • Seafood harvesting; • Marine fish harvesting; • Guided sport fishing; and • Marine-based tourism. Potential effects on marine commercial use include displacement of commercial crab harvesting during construction and operation, resulting in a potential change of harvesting area, total harvest, and revenue, due to the Project footprint and the proposed expansion of the area closed to commercial crabbing. The VFPA will work with DFO to engage commercial crab harvesters to identify and implement feasible mitigation measures, and will	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 12.0 Marine Invertebrates 16.0 Ongoing Productivity of Commercial, Recreational, and Aboriginal Fisheries 21.0 Marine Commercial Use 21.6 Future Conditions with the Project – Potential Project-related Effects 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Land and Resources for Traditional Purposes 32.2.6 Future Conditions With the Project - Potential Project-Related Effects

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
			identified the opportunity for future VFPA-Aboriginal group collaboration. **12-Apr-2018, Letter from the VFPA to Stz'uminus First Nation:** Stated that since your concerns were raised, the Project team has conducted further work on these topics to respond to information requests from the Review Panel, to better understand potential effects and suggested mitigation, and to gain deeper understanding of the viewpoints of Indigenous groups and stakeholders. Provided the RBT2 Crab Mitigation Summary Overview, which detailed the following: • Mitigation measures to avoid or reduce effects to crab as outlined in the EIS; and • Additional crab harvesting related mitigation measure suggestions under review. Stated that the VFPA is interested in hearing views regarding options to mitigate potential effects to crabs and crabbing in the Project area.	implement construction and operation environmental management plans related to construction phase communication, construction monitoring, and crab salvages effects from displacement of commercial crab harvesting during construction and operations. The Project is anticipated to result in a negligible effect to marine fish harvesting, guided sport fishing, and marine-based tourism. These negligible effects are related to changes in area, access, resource availability, and harvesting revenues. The Project is expected to result in a residual effect of changes to seafood harvesting area, harvest, and revenue. The residual effect is determined to be not significant, as Dungeness crab are known to move substantial distances to baited traps, and harvest activity can be moved to another open area. Other planned or reasonably foreseeable projects and activities would also displace crab harvesting, and this effect would combine with that of the Project to result in an incremental cumulative effect on commercial crab fishing. This adverse incremental cumulative effect is determined to be not significant. **Addressed in response to IR10-07:** The VFPA's response to IR10-07, as requested by the Review Panel, further discusses potential economic implications of any permanent or temporary displacement related to the navigational closure.	**Information Requests** Response to Sufficiency Information Request #07 (IR10-07)
STZ-16.5	Requested specific information which explains how ATK was utilised in subcomponent selection – pertaining to the marine invertebrates' effects assessment.	15-Jun-2015, Letter to the CEA Agency from Cowichan Tribes and Stz'uminus First Nation (CEAR Document #242)	**13-Oct-2015, Letter from the CEA Agency to Stz'uminus First Nation (CEAR Document #311):** *"The Agency has requested additional information on Aboriginal Traditional Knowledge its letter of July 31, 2015 to [the VFPA] (page 3, #8)."*	**Addressed in responses to IR-7.31.15-08 and MSA IR-02.24.16-4:** How ITK was utilised in the EIS and MSA is described in the VFPA's responses to IR-7.31.15-08 and MSA IR-02.24.16-4. In the case of marine invertebrates, sub-component selection was informed by other types of Indigenous information, but relevant ITK was not available.	**Information Requests** Response to Information Request #8 (IR-7.31.15-08 of CEAR Document #314) Response to Additional Information Request #4 (MSA IR-02.24.16-4 of CEAR Document #386)
STZ-16.6	Stated that the characterisation of existing conditions is reflective of the year 2013, when marine invertebrate studies were completed in the local assessment area. The selection of 2013 as a baseline is arbitrary. Asked how the EIS conclusions would change with an earlier baseline.	15-Jun-2015, Letter to the CEA Agency from Cowichan Tribes and Stz'uminus First Nation (CEAR Document #242)	**13-Oct-2015, Letter from the CEA Agency to Stz'uminus First Nation (CEAR Document #311):** *"The Agency has requested additional information on this item in its letter of July 31, 2015 to [the VFPA] (page 7, #13)."*	**Addressed in response to AIR-12.04.15-13:** In the EIS, the existing conditions (at around the time of EIS writing) (baseline) reflect the conditions of the environment as modified by past development. Further discussion of how the VFPA considered the effects of past, present, and future projects is provided in completeness-phase AIR-12.04.15-13, including in that response's schedules focused on applicable VCs.	**Information Requests** Response to Additional Information Request #13 (AIR-12.04.15-13 of CEAR Document #388)

Table 18: Marine Shipping Addendum

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-18.1	Concerned with cumulative effects to Aboriginal rights associated with marine shipping. Stated that increases in shipping will result in "death by a thousand cuts". Concerned that the draft Current Use Summary does not include effects from malfunctions or accidents, as well as cumulative environmental effects.	17-Jun-2015, Meeting with Cowichan Nation Alliance 09-Sep-2015, Letter to the VFPA from Cowichan Tribes on behalf of Cowichan Nation Alliance	**17-Jun-2015, Meeting:** Recorded comment for follow-up. **02-Oct-2015, Letter from the VFPA to Cowichan Tribes cc: Stz'uminus First Nation, Halalt First Nation, Penelakut Tribe:** Explained that the document shared by the VFPA on July 27, 2015 included a draft summary of CNA's current use in the marine shipping study area, and therefore did not include accidents and malfunctions or potential effects. Noted that these topics will be addressed in the Report to be submitted to the Canadian Environmental Assessment Agency ("CEAA") in the fall of 2015. **09-Nov-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the MSA for the proposed Project, which included its assessment of cumulative effects in MSA Section 6.0.	**Addressed in MSA Appendix 5-B (#23):** The approach to the cumulative effects assessment is provided in MSA Section 6.0. Each IC and VC assessment section considers cumulative changes and cumulative effects to which the Project contributes. This entails consideration of residual effects of routine marine shipping associated with the Project, if any such effects are predicted, in combination with effects of other projects and activities that have been or will be carried out. MSA Section 9.5 describes how Current Use activities have been affected by other projects and activities that have been carried out. As residual effects to Current Use as a result of marine shipping associated with the Project are not predicted, an assessment of future cumulative effects was not carried out. Taking a precautionary approach, the assessment of potential impacts to Indigenous groups' ability to exercise asserted or established Aboriginal and treaty rights as a result of Project-associated shipping was based on the assumption that traditional use presently occurring in the marine shipping area (i.e., Current Use) is an expression of the exercise of Aboriginal or treaty rights. Where traditional use was not identified as occurring at present within the marine shipping area, but similar use was identified as practiced in the past in the marine shipping area, asserted as an Aboriginal right, or protected under treaty, this use was assumed to be potentially exercisable as an Aboriginal or treaty right, and subject to potential impacts as a result of Project-associated shipping in much the same way as potential effects on Current Use. Considering the conclusions of the Current Use assessment, marine shipping associated with the Project is expected to result in a minor incremental adverse impact on the ability of Indigenous groups to exercise Aboriginal or treaty rights within the marine shipping a without mitigation. This minor impact is expected because of the potential overlap of asserted or established rights-based activities with the incremental increase in Project-associated container ship pass-bys. Suggested mitigation includes development of a marine shipping activities communication plan and consultation with affected Indigenous groups concerning the outbound international shipping lane location. These mitigation measures for addressing potential incremental effects on Current Use are expected to also be effective at addressing the	**MSA** Appendix 5-B Aboriginal Issues and Interests 6.0 Effects Assessment Approach 6.7 Cumulative Effects Assessment 7.1 through 9.4 (All IC and VC assessments) 9.5 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
				potential incremental impact to the exercise of Aboriginal and treaty rights. No additional mitigation measures have therefore been suggested for the potential incremental impact to the exercise of Aboriginal and treaty rights.	
STZ-18.2	Stated that Canada, B.C., Parks and First Nations are working to establish the National Marine Conservation Initiative in the Gulf Islands. Concerned with impacts from shipping to this initiative and conservation areas.	17-Jun-2015, Meeting with Cowichan Nation Alliance	**17-Jun-2015, Meeting:** Recorded comment for consideration by Project team. **02-Oct-2015, Letter from the VFPA to Cowichan Tribes cc: Stz'uminus First Nation, Halalt First Nation, Penelakut Tribe:** Stated that potential effects will be addressed in the MSA, which will be submitted to the CEA Agency. **09-Nov-2015, Letter from the VFPA to Stz'uminus First Nation**: Provided a copy of the MSA for the proposed Project, which included MSA Appendix 5-B listing all the issues and interests raised by Indigenous groups and the VFPA's response.	**Addressed in MSA Appendix 5-B (#26):** The conservation areas within the marine shipping area are described in MSA Section 2.1.2 and shown on MSA Figure 2-2. The extent to which potential effects of marine shipping associated with the Project are predicted to occur within conservation areas is addressed within each relevant IC or VC section.	**MSA** 2.0 Geographic Setting 2.1.2 Species at Risk and Conservation Areas Figure 2-2 Conservation Areas in and near the Marine Shipping Area Appendix 5-B Aboriginal Issues and Interests
STZ-18.3	Concerned with the impacts of marine shipping to short fishing openings.	17-Jun-2015, Meeting with Cowichan Nation Alliance	**17-Jun-2015, Meeting:** Recorded comment for consideration by Project team. Noted that the VFPA is not involved in setting the regulations for Aboriginal fisheries. **02-Oct-2015, Letter from the VFPA to Cowichan Tribes cc: Stz'uminus First Nation, Halalt First Nation, Penelakut Tribe:** Stated that potential effects will be addressed in the MSA, which will be submitted to the CEA Agency. **09-Nov-2015, Letter from the VFPA to Stz'uminus First Nation**: Provided a copy of the MSA for the proposed Project, which included MSA Appendix 5-B listing all the issues and interests raised by Indigenous groups and the VFPA's response.	**Addressed in MSA Section 9.2:** Potential effects of vessel transit from Project-associated shipping on commercial fish and seafood harvesting marine area displacement, access, fish and seafood availability, and gear damage or loss would not be measurable from existing conditions and are therefore considered to be negligible. Potential consequential effects on harvest and associated revenues of commercial fishing and seafood enterprises are also considered to be negligible. When all lines of evidence are considered, the effect of vessel transit on commercial fishing and seafood harvesting is considered to be negligible.	**MSA** 9.2 Marine Commercial Use 9.2.5.1 Negligible Effects

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-19.1	Concerned with the potential effects of the Project on eelgrass habitat for crabs and other species.	22-Oct-2014, Cowichan Nation Alliance EIS Workshop #1	**22-Oct-2014, Workshop:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses. **28-Jul-2016, Workshop:** Explained that the EIS predicted a negligible effect on eelgrass overall. There is a negligible effect which is offset through transplants. The placement of the terminal will also create a wave shadow causing more optimal conditions for eelgrass growth. We don't believe there will be eelgrass mediated effects to crabs.	**Addressed in EIS Appendix 7.2-B (#68):** Potential effects on eelgrass habitat, as well as on crabs and other species that use eelgrass habitat, are described in the EIS. Eelgrass beds are highly productive habitats in the Roberts Bank ecosystem, serving numerous critical functions, such as food, shelter, and rearing habitat for numerous species. Eelgrass is a sub-component of the marine vegetation assessment. The assessment concludes that changes in productivity of eelgrass are predicted to be negligible (i.e., not measurable or detectable). Increases in productivity of eelgrass are anticipated with the implementation of standard management practices and environmental management plans, and the creation of onsite habitat. Approximately three hectares of native eelgrass will be established through transplants in the inter-causeway area.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 11.0 Marine Vegetation 11.6.3 Potential Effect – Changes in Productivity 11.7.2 Reduction and Off-setting Measures 12.0 Marine Invertebrates 12.6.3 Potential Effect – Changes in Productivity 12.7.2 Mitigation #1 for Direct Mortality
STZ-19.2	Concerned with the conclusions of significance for biofilm including for the cumulative effects assessment. Asked about the certainty of confidence modelling and whether it is possible to see the results from an independent third party review on the marine vegetation effects assessment.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014, Workshop:** Responded that the confidence for biofilm is relatively high. Studies were not limited to modelling; the Roberts Bank ecosystem model is not being relied upon for the confidence prediction. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses **24-Apr-2017, Email from the VFPA to Stz'uminus First Nation**: The VFPA is conducting a study in April and May 2017 to assess the spatial and temporal variability of biofilm community composition at Roberts Bank. Biofilm is a thin (~2 mm), dense layer of predominantly organic substances (e.g., diatoms, bacteria, and organic detritus) found on the surface of shallow freshwater, marine, and estuarine sediments. Biofilm is known to form an important component of the western sandpiper diet at Roberts Bank during the northward migration. This study, in conjunction with past biofilm studies conducted in 2012, 2013, 2014, and 2016, will strengthen the existing understanding of biofilm community dynamics at Roberts Bank, and may inform future monitoring programs at Roberts Bank.	**Addressed in EIS Appendix 7.2-B (#63):** In January 2014, the federal Minister of Environment referred the Project for an environmental assessment by an independent review panel. The entire EIS, including the marine vegetation assessment, will be subject to an independent review. The scope and methods of the marine vegetation study are presented in EIS Section 11.0. The assessment of marine vegetation focused on eelgrass, intertidal marsh, macroalgae, biomat, and biofilm. Studies were informed by engagement with the Shorebirds-Biofilm TAG and regulatory agencies. The LAA included Roberts Bank, and the RAA included Roberts Bank, Roberts Bank North, the lower Fraser River, Canoe Passage, and Boundary Bay. Existing conditions were characterised for representative species for each of eelgrass, intertidal marsh, macroalgae, biomat, and biofilm. Existing conditions for marine vegetation are influenced by previous developments, including the development of the Roberts Bank and BC Ferries terminals, the dynamic natural environment, and species that forage on marine vegetation. Overall, net productivity of marine vegetation is expected to increase with the Project, without mitigation, and would be further increased with the implementation of environmental management plans and the creation of habitat. The overall productivity increase is due to sheltering of the intertidal zone shoreward of the terminal, which would optimise physical conditions for marine vegetation. During Project construction and operation, changes in productivity of eelgrass, biofilm, and biomat are predicted to be negligible (i.e., not measurable or detectable), while increases in productivity of intertidal marsh is expected. Productivity of rockweed, a macroalgae, is predicted to decrease during construction and operation. This decrease can	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 11.0 Marine Vegetation **Information Requests** Response to Sufficiency Information Request #4 (IR8-04 of CEAR Document #1110)

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
				be mitigated through the creation of onsite subtidal rock reef habitat. The Project is expected to temporarily influence community composition of biofilm during freshet from terminal footprint-related changes in salinity but is expected to return to existing conditions outside of the annual freshet period. The assessment concludes that there are no significant adverse residual effects from the Project to marine vegetation, as it will continue to maintain its existing ecological functions. The Project is not expected to result in any incremental cumulative effects to marine vegetation. **Additional information provided by the VFPA:** The VFPA's response to IR8-04 presents the results of studies undertaken in 2017 related to biofilm dynamics. The studies' results complement the findings of the EIS and add to the overall understanding of biofilm science. In summary, the results align with the following conclusions in the EIS, specifically that: • Ongoing salinity monitoring continues to show that under existing conditions there is large variation in salinity across Roberts Bank due to variable Fraser River flow and tidal mixing; • Biofilm is abundant across the existing salinity gradient, found in both freshwater- and marine-influenced locations; and • The Project will not affect the availability or quality of food available to migrating western sandpipers.	
STZ-19.3	Asked for clarification on the statement that biomat and biofilm are relatively new to science. Asked if there could be other things that the biologists are not aware of.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014, Workshop:** Stated that biofilm is relatively new to science in that it was first discovered at Roberts Bank in 2003, in association with work being undertaken for the DP3 project. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses **24-Apr-2017, Email from the VFPA to Stz'uminus First Nation:** The VFPA is conducting a study in April and May 2017 to assess the spatial and temporal variability of biofilm community composition at Roberts Bank. Biofilm is a thin (~2 mm), dense layer of predominantly organic substances (e.g., diatoms, bacteria, and organic detritus) found on the surface of shallow freshwater, marine, and estuarine sediments. Biofilm is known to form an important component of the western sandpiper diet at Roberts Bank during the northward migration. This study, in conjunction with past biofilm studies conducted in 2012, 2013, 2014, and 2016, will strengthen the existing understanding of biofilm	**Addressed in EIS Section 11.0 and EIS Appendix 7.2-B (#65):** Biofilm, a thin dense layer of microscopic photosynthetic algae and bacteria, sediment, and organic matter, is found within the upper intertidal zone and is an important food source for invertebrates, fish, and bird species (including migratory western sandpiper and dunlin). Biomat is described as microbial mat, which can take different forms and be composed of a variety of single and multi-cellular organisms, which for the purposes of the marine vegetation effects assessment, is defined as blue-green algae and associated diatoms. Biomat, located in the upper intertidal area of Roberts Bank, is a primary producer and is likely consumed by higher trophic levels. **Additional information provided by the VFPA:** The VFPA's response to IR8-04 presents the results of studies undertaken in 2017 related to biofilm dynamics. The studies' results complement the findings of the EIS and add to the overall understanding of biofilm science. In summary, the results align with the following conclusions in the EIS, specifically that: • Ongoing salinity monitoring continues to show that under existing conditions there is large variation in salinity across Roberts Bank due to variable Fraser River flow and tidal mixing;	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 11.0 Marine Vegetation 11.5.4 Existing Conditions, Biomat 11.5.5 Existing Conditions, Biofilm 11.6. Future Conditions with the Project 11.6.4 Potential Effect – Changes in Biofilm Assemblage Composition 15.0 Coastal Birds 15.7.2 Potential Effect – Changes in Productivity **Information Requests** Response to Sufficiency Information Request #4 (IR8-04 of CEAR Document #1110)

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
			community dynamics at Roberts Bank, and may inform future monitoring programs at Roberts Bank.	• Biofilm is abundant across the existing salinity gradient, found in both freshwater- and marine-influenced locations; and • The Project will not affect the availability or quality of food available to migrating western sandpipers.	
STZ-19.4	Concerned about the role of offsetting within the determination of residual effects. Requested more information related to habitat offsetting.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014, Workshop:** Stated that the potential effect would be site-specific to RBT2. This presentation does not discuss any offsetting work that the VFPA would consider in conjunction with the Project. This assessment looks at whether there are any potential effects, and considers how they could be avoided or mitigated. If they cannot be avoided or mitigated and there is a residual effect that is when offsetting would be considered. The VFPA is undertaking an extensive program for offsetting. For marine vegetation, there are two potential Project-related effects. The first is decreased productivity, for which mitigation measures (including offsetting) are anticipated to result in there being no residual effects. The VFPA referred to slide 17 (of Marine Vegetation presentation, Cowichan Nation Alliance Workshop #2), which is a table of the marine vegetation sub-component species and their expected difference in productivity between future conditions without the Project and future conditions with the Project. There is an onsite habitat mitigation program, where work would be expected to be conducted right at and near the terminal. It is anticipated that work will be successful. Some measures may be able to be done in advance, and we will know whether or not they are successful. There is also a commitment to monitor. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's responses	**Addressed in EIS Appendix 7.2-B (#28):** Project-related effects on marine biophysical VCs that cannot be fully mitigated through avoidance or reduction or other mitigation measures will be addressed through offsetting. Offsetting proposed for this Project is focused on the creation and enhancement of biophysical habitats that currently support species of the Roberts Bank ecosystem. The concepts proposed are consistent with current legislation and policy and are based on well-established techniques that have been successfully implemented at Roberts Bank, elsewhere in B.C., and in the Pacific Northwest. The EIS includes a description of onsite habitat concepts to offset potential decreases in productivity, including the identification of beneficial habitat types for each of the VC sub-components, and representative species and groups where applicable. **Addressed in EIS Appendix 7.2-B (#198):** Onsite habitat is intended to soften the perimeter of the Project's shoreline to be more ecologically representative of the existing estuary, to create similar habitat to those that will be affected by the Project, and to create habitat that generally enhances the productivity of the Roberts Bank ecosystem. The five habitat types considered for onsite offsetting include: • Intertidal marsh: Important for shoreline stabilisation, gas and nutrient regulation, contaminant filtering, and nutrient supply, as well as providing structural habitat used for shelter and food by organisms. Some of the species that use intertidal marsh habitat at Roberts Bank include bivalve shellfish, Dungeness crabs, juvenile Chinook salmon, shiner perch, sand lance, and waterfowl. Approximately 15 ha of intertidal marsh is proposed along the widened causeway and in the S-bend of the new terminal. • Sandy gravel beach: Provides spawning area for forage fish, including surf smelt, Pacific herring, and sand lance. Two sandy gravel beaches, totalling approximately 4.5 ha, are proposed along the widened causeway. The beaches are intended to provide attachment-type habitat and substrate suitable for marine vegetation and invertebrates, and to benefit some of their predators (e.g., juvenile Chinook salmon, waterfowl, and American wigeon). • Mudflat: Plays a role in dissipating wave energy and supports large numbers of birds and fish. Mudflats also support biofilm, an important component of the food web in estuarine and coastal ecosystems. Approximately 4.5 ha of mudflats is proposed along the widened causeway and in the S-Bend of the new terminal. Biofilm,	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 17.0 Mitigation for Marine Biophysical Valued Components 17.3 Offsetting Potential Effects 17.3.2 Offsetting Potential Effects, Offsetting Framework

Stz'uminus First Nation

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
				invertebrates, waterfowl, and shorebirds will benefit from this habitat. • Subtidal rock reefs: Support rockfish populations and assist in meeting fisheries management objectives to alleviate historic declines of regional populations. The creation of approximately two hectares of reef habitat will benefit macroalgae vegetation, and provide refuge, feeding, and spawning habitat for invertebrates, fish, and birds. • Eelgrass: Eelgrass beds are highly productive habitats in the Roberts Bank ecosystem, serving numerous critical functions, such as food, shelter, and rearing habitat for numerous species. Approximately three hectares of native eelgrass will be established through transplants in the inter-causeway area. The onsite habitat concepts presented in EIS Section 17.0 have been presented to Indigenous groups, the community, stakeholders, and the public in open houses and small group meetings that took place in the fall of 2014. The feedback received from Indigenous groups has been considered in the finalisation of the EIS.	
STZ-19.5	Concerned that the assessment excludes marine vegetation that is culturally important to Cowichan Nation Alliance and could be impacted by the Project. Requested that 'coastal terrestrial vegetation' be identified as a distinct Valued Component.	09-May-2014, Letter from Cowichan Tribes acting in alliance with the Stz'uminus, Penelakut, Hwlitsum and Halalt communities	**09-May-2014:** Recorded comment for consideration by the Project team. **06-Jun-2014 and 03-Jul-2014, Workshops:** The VFPA hosted two workshops for Indigenous groups on the VCs providing them with an opportunity to comment on the proposed VCs. For coastal terrestrial vegetation, there is no interaction with the Project and the terrestrial environment, either directly or indirectly, due to the marine-based nature of the Project, and therefore no effects are anticipated.	**Addressed in EIS Section 8.0:** The process for selecting VCs is described in EIS Section 8.0. Rationale for not selecting terrestrial vegetation as a VC is provided in EIS Appendix 8-A. Terrestrial vegetation on the Roberts Bank causeway to the track tie-in location (a less than 1 ha area with in the British Columbia Rail (BCR) right-of-way) is characteristic of highly disturbed sites. Terrestrial vegetation of ecological value does not occur proximal to the Project. Additionally, the Project area does not contain any wetlands above the high water level. Wetlands below high water level are included in the marine vegetation VC.	**EIS** 8.0 Effects Assessment Methods Appendix 8-A Valued Component Selection Rationale Table 8-A2 Rationales for Candidate Component Exclusion Decisions and Other Considerations

Stz'uminus First Nation

Table 20: Mitigation for Marine Biophysical Valued Components (including Onsite Habitat Concepts)

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-20.1	Asked what the rationale is for including fish refugia in the caisson design.	01-Nov-2013, Meeting with Cowichan Nation Alliance	**01-Nov-2013, Meeting:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Section 13.0 Marine Fish.	**Addressed in EIS Sections 4.0 and 13.0:** A mitigation opportunity for marine fish during operation of the terminal includes provision of refuge habitat in the caissons. To increase the availability and connectivity of refuge habitat for marine fish, and to provide a diversity of potential food sources, design options for the caisson face have been considered (EIS Section 4.0) and are described further in EIS Section 13.7.1.3. **Additional information provided by the VFPA:** **07-Jan-2014, Letter from the VFPA to Penelakut Tribe:** The upper portions of the caissons are not filled with ballast rock, only water. In previous projects, such as DP3, a decision was made to provide an opening into every 2nd or 3rd caisson to allow fish and marine creatures to seek refuge inside this water filled area of the caisson. This fish refugia concept was carried over in the design for the proposed Project. It is an accepted DFO habitat development concept.	**EIS** 4.0 Project Description 13.0 Marine Fish 13.7.1.3 Caisson Fish Habitat
STZ-20.2	Asked what the mortality rate during crab salvage efforts would be during molting season.	28-Jul-2016, Issues Workshop – Island Nations	**28-Jul-2016, Workshop:** Stated that mortality related to construction activities has not been quantified. Assumptions would have to be made around density, which could be done; the VFPA is hoping that the mitigation will be good enough in that crabs will be trapped and removed from the construction area, and timing windows would be respected to reduce mortality.	**Addressed in response to IR5-04:** The VFPA's response to IR5-04 discusses the planned approach for crab salvage during the construction of RBT2. Salvages are planned for all Project activities that have the potential to cause direct mortality to legal-sized male and gravid female Dungeness crabs. A list and schedule of proposed Project activities is provided in Table IR5-04-1; the activities for which Dungeness crab mortality or injury may occur are indicated, and for those activities that may cause mortality or injury, plans for salvages are also indicated.	**Information Requests** Response to Sufficiency Information Request #4 (IR5-04 of CEAR Document #1209)

Stz'uminus First Nation

Table 21: Noise and Vibration – Intermediate Component

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information

STZ-21.1	Concerned about potential noise effects from shunting to wildlife and humans.
	Stated that members are affected and interrupted by the shunting.
	Asked if the numbers (of noise events) presented are an expected average over a 24-hour period.
		22-Oct-2014, Cowichan Nation Alliance EIS Workshop #1	**22-Oct-2014, Workshop:**
			Recorded comment for consideration by Project team.
			01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:
			Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.
			19-Apr-2016, Letter from the VFPA to Stz'uminus First Nation:
			Shared meeting notes from the 22-Oct-2014 workshop, which included the following post-meeting note: Stated that the number of noise events is predicted on a per-hour basis.
				Addressed in EIS Appendix 7.2-B (#43):
				The potential changes in noise and vibration that may be caused by the Project, and the potential effects of those changes on biophysical VCs and human health are considered in the EIS. Mitigation measures to address noise-related effects are also described in the EIS.
				The noise and vibration assessment examined potential changes in noise and vibration as a result of the Project. The results of the noise and vibration assessment were used in the assessments of coastal birds, marine commercial use, outdoor recreation, human health, and Current Use.
				The assessment considered the potential changes in noise and vibration that may result from the Project and the potential cumulative changes in noise and vibration that are likely to result from the Project in combination with other certain and reasonably foreseeable projects and activities, including incremental marine vessel traffic.
				The assessment considers noise and vibration from trains, as a source contributing to existing conditions, as well as a potential Project-related source of noise and vibration and a potential source of cumulative change in noise and vibration.
				Mitigation measures related to noise are included in the human health assessment (EIS Section 27.9.2).
				The assessment considered Project-related sources of noise and vibration, including construction equipment, container ships at berth, container handling activities, and movement of trains and trucks on the terminal and causeway. The assessment focused on continuous noise, low frequency noise, transient and impulsive noise, and ground-borne vibration.
				The assessment concluded that:
				• Project-related changes in annual average noise levels in communities near the Project are expected to be minor and, for the most part, not perceptible.
				• The Project, in combination with other certain and reasonably foreseeable projects and activities, is expected to result in minimal incremental cumulative changes to noise in areas close to road and rail corridors.
				• Some changes in noise conditions that could be perceptible include:
				  ○ Increased noise during periods of peak construction activity.
				  ○ The number of intermittent noises during operation would increase, but the noise levels would be the same or lower than from the existing Roberts Bank terminals.
				  ○ Increased noise in marine areas is expected to be perceptible close to the terminal.
				  ○ The construction and operation of the marine terminal and causeway is not expected to result in perceptible increases in levels of ground-borne vibration.
				Suggested mitigations were considered in the development of proposed mitigation for Project-related changes in noise. Noise Management Plans would be developed for construction and operation phases and would integrate with the VFPA's existing noise monitoring programs.
				Mitigation of construction-related noise would include:
				• Scheduling of higher-noise generating activities during weekdays, and during the daytime;
				• Shutdown of equipment and vehicles when not in use;
				• Utilisation of equipment that produces less noise; and

				• Awareness and training for construction crews. Mitigation for operation-related noise would include: • Optimised tonality of equipment alarms to limit audibility on shore while meeting safety requirements; • Operator awareness and training; and • Regular maintenance of equipment (e.g., lubrication of pulleys and other moving parts, replacement of deteriorated exhaust mufflers, maintaining efficiencies of engines through servicing).	
STZ-21.2	Noted that Penelakut has a village site at the north end of Galiano Island at Porlier Pass. Asked if studies were done on the west side of Porlier Pass and the Gulf Island passages.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014, Workshop:** Referred to the work carried out by acoustician that determined the areas identified in the slide is where noise is expected to go. Stated that sound does not necessarily travel with currents. Rather, it bounces off of surfaces. There is likely to be noise in that area, but not Project noise, which is what the slides are referring to. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in EIS Appendix 7.2-B (#44):** The spatial boundaries for the noise and vibration assessment, and the rationale for their selection, is included in EIS Section 9.3. The marine study area includes all marine areas within 10 km of the proposed terminal, including areas at the mouth of the Fraser River and Canoe Passage, north of the northern tip of Westham Island. The spatial boundaries for the noise and vibration assessment, and the rationale for their selection, is included in EIS Section 9.3.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 9.0 Physical Setting 9.3 Noise and Vibration

Table 22: Port Operations

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-22.1	Asked where ships currently re-fuel in the VFPA's jurisdiction.	01-Nov-2013, Meeting with Cowichan Nation Alliance	**01-Nov-2013, Meeting:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS Section 4.4.2.1 Container Ship Manoeuvres.	**Addressed in EIS Section 4.4.2.1:** Facilities to support bunkering of ships do not exist at Roberts Bank, nor does the Project include any facilities to support bunkering. Container ships usually bunker at one of their home ports. **Further information provided by the VFPA:** **07-Jan-2014, Letter from the VFPA to Penelakut Tribe:** Container ships cannot re-fuel at Roberts Bank. Container ships are on a tight schedule and will arrange to pick up fuel at a location where they will be at berth for a longer time (home port) and where fuel is less expensive, usually in Asia. Vessels within the VFPA's jurisdiction that need to re-fuel will typically take on fuel in Burrard Inlet, alongside at berth or at one of the designated anchorages in the inlet. The fuel is delivered to the vessels by barge, either from the Stanovan Marine Terminal (Chevron) in Burnaby or the Shellburn Marine Terminal (Shell Canada), also in Burnaby. Tugs used to guide the container ships during arrival and departure, bunker at the Chevron marine fuelling station in Burrard inlet.	**EIS** 4.4.2.1 Container Ship Manoeuvres
STZ-22.2	Concerned about traffic and increased use of anchorages around the Gulf Islands. Concerned about increased number of large ships anchoring in Cowichan Tribes territory. Stated that increased shipping traffic from the proposed Project would likely increase the frequency of these freighters anchoring in Cowichan Bay. Concerned with sewage effluent and ships moored and anchored south of Penelakut and north of Thetis Island. Stated that ships are dumping effluent and it is impacting their beaches. Stated that they are there for two weeks and does not know why they would not be in the Fraser River.	17-Jun-2014, Technical Working Group Meeting #4 09-Sep-2015, Letter to the VFPA from Cowichan Tribes on behalf of the Cowichan Nation Alliance 18-April-2017, Chief & Council Meeting – Cowichan Nation Alliance 07-Nov-2017, Cowichan Nation Alliance Meeting with Federal Agencies	**17-Jun-2014, Meeting:** Recorded comment for consideration by Project team. **02-Oct-2015, Letter from the VFPA to Cowichan Tribes cc: Stz'uminus First Nation, Halalt First Nation, Penelakut Tribe:** Referred Cowichan Nation Alliance to Section 3.3.2 of the Marine Shipping Overview document sent to Cowichan Nation Alliance on May 26, 2015: There are no plans, or foreseen terminal operating requirements, for off-terminal anchoring of container ships waiting for a berth at the new RBT2 marine terminal. Container ships operate on a scheduled service, usually between Asia and the west coast, and adjust their speeds as required to arrive at the terminal within their assigned arrival window; thus, anchorage is not a normal requirement. Exception to this could occur in the event of an extreme storm event in the Pacific Ocean, resulting in a refuge anchorage requirement for safety reasons or to accommodate unexpected ship-specific maintenance personnel, or operation issues that may arise. Container ship anchorages for	**Addressed in EIS Appendix 7.2-B:** The scope of the Project, as defined in the *EIS Guidelines* issued by the CEA Agency, includes vessel movements within VFPA jurisdiction, including approach, berthing, unberthing, and departure from the terminal. The assessment does not include the anchoring of ships in the Gulf Island area. The MSA includes an assessment of the impacts of Project-associated marine shipping outside the VFPA's jurisdiction. For questions regarding island anchorages, please contact the CEO of the Pacific Pilotage Authority at [email address]. **Addressed in MSA Appendix 5-B (#3):** Anchorage is discussed in MSA Section 4.0. Container ships operate on a scheduled service, and adjust their speeds as required to arrive at the terminal within their assigned arrival window; thus, anchorage is not a normal requirement and there are no plans or requirements for off-terminal anchoring of container ships waiting for a berth at the new RBT2 marine terminal. Exceptions to this could occur in the event of an extreme storm event in the Pacific, resulting in refuge anchorage requirement for safety reasons, or to accommodate unexpected ship-specific maintenance, personnel, or operation issues that may arise. The assessment of marine shipping associated with the	**EIS** 4.4.2.1 Container Ship Manoeuvres Appendix 7.2-B Aboriginal Groups Interests and Issues Table **MSA** 4.0 Activity Description 4.2.2.2 Anchorage Appendix 5-B Aboriginal Issues and Interests **Information Requests** Response to Sufficiency Information Request #01 (IR5-01 of CEAR Document #1078) **TC IR-07 of CEAR Document #982 from Transport Canada to the Review Panel re: Response to Information Requests issued by the Review Panel on May 10, 2017**

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
			Deltaport Terminal in 2012 and 2013 were rare, with a frequency range of three to four per year out of an approximate annual total of 270 ship calls to Deltaport Terminal in each of those years. The same frequency can be assumed for marine shipping associated with RBT2, resulting in approximately three to four unforeseen container ship anchorages per year. As defined in the *EIS Guidelines*, issued by the CEA Agency, the scope of the Project includes marine transportation within the VFPA's jurisdiction. Ship traffic through the Gulf Islands is outside of the scope of the Project. The MSA includes an assessment of potential effects associated with marine shipping outside the VFPA's jurisdiction. The spatial boundaries are included in the noise and vibration (EIS Section 9.3) and underwater noise (EIS Section 9.8) assessments. Project-related changes to noise and vibration, both above water and underwater, are not expected to extend from the Project area into this area. The appropriate authority for comments related to island anchorages is the Pacific Pilotage Authority (contact information provided). **18-April-2017, Meeting:** Recorded comment for consideration. **07-Nov-2017, Meeting:** Cowichan Nation Alliance met with federal agencies, including the CEA Agency, Transport Canada, ECCC, Health Canada, DFO, NRC, and the Canadian Coast Guard. Transport Canada committed to connect Cowichan Nation Alliance with a representative of Transport Canada to discuss anchorage concerns further. **16-Nov-2017, Email from the CEA Agency to Cowichan Tribes:** Provided draft meeting notes from the 07-Nov-2017 meeting, which included a link to IR5-01 that discusses aspects of anchorage outside of the VFPA's jurisdiction and TC IR-07.	Project is based on a routine vessel transit scenario. Because anchorage only occurs in rare circumstances, anchorage is not assessed as an activity related to marine shipping associated with the Project. **Additional information provided in response to IR5-01:** The VFPA's response to IR5-01 generally discusses aspects of anchorage outside of the VFPA's jurisdiction. Notably, it references detailed information regarding anchorages in Transport Canada's response to Panel information request TC IR-07 from Transport Canada to the Review Panel. Transport Canada's response to information request TC IR-07 tabulates detailed information regarding anchorages and minimum, mean, and maximum number of days in Appendix D (Pacific Pilotage Authority Anchorage Usage Data 2012 – 2016 for the Pacific Pilotage Authority Marine Shipping Area). As shown in these tables, a total of 124 anchorages occurred between 2012 and 2016 for container vessels destined for VFPA jurisdiction, and the mean number of anchorage days was 2.69, with a minimum of 0.05 days and a maximum of 83.64 days. **Additional information provided by the VFPA:** Information regarding an interim protocol for the use of Southern B.C. Anchorages can be found on Transport Canada's website. The following text is an excerpt from the *Interim Protocol for the Use of Southern B.C. Anchorages webpage*: An interim protocol for the use of Southern B.C. anchorages has been developed by Transport Canada in collaboration with the Chamber of Shipping of BC, the Shipping Federation of Canada, the Pacific Pilotage Authority, the VFPA, and the Port of Nanaimo (working group members). It also takes into account comments provided to Transport Canada by coastal communities about the impact of increased use of anchorages in their surrounding waters. Drafts of the interim protocol were also shared with coastal communities and Indigenous groups. Under the protocol, the VFPA assigns anchorages as equitably as possible, subject to individual anchorage size restrictions, using their computerised queueing system, which takes into account the dimensions of the vessel and specific anchorage usage over the previous 30 days. The objective of this approach is to balance the usage, so that no single anchorage is in constant use, and that that there is an equitable rotation of use through all suitable anchorages. Noise and Lights: All vessels, while at anchor, should minimise noise levels and light usage in consideration of local residents. The following guidelines apply:	**Interim Protocol for the Use of Southern B.C. Anchorages. Available at:** **https://www.tc.gc.ca/en/services/marine/ports-harbours/interim-protocol-use-southern-bc-anchorages.html**

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
				Noise: • Generator usage should be reduced to the minimum required generator(s) to operate essential services and systems; • External doors and hatches to machinery spaces must be kept closed as often as possible; • Use of power tools and chipping hammers must be kept to a minimum and is not permitted on deck on weekends, nor between 1900 and 0700 hours on weekdays. Lights: • While the vessel is to be lit in compliance with the Collision Regulations, deck lights must be kept to a minimum; and • Lighting used to illuminate. Concerns with any of the specifics related to the responsibilities of ships at anchor (e.g., noise, light) within the protocol, can be reported to the VFPA Operations Centre. The VFPA Operations Centre will relay the complaints to the vessel agent with a copy to the Chamber of Shipping of BC, the Shipping Federation of Canada, and Transport Canada with the request to follow up with the vessel. The Interim Protocol is a temporary and voluntary measure that addresses some of the concerns Canada and the Port have heard in recent years. The Oceans Protection Plan, National Anchorage Framework will be undertaking the studies and consultation necessary to develop principles that determine the location and management practices for anchorages outside of ports in the future. In 2017, Transport Canada announced the Oceans Protection Plan's Anchorages initiative. The Anchorages Initiative will engage governments, marine industry, Indigenous groups, community organisations, and stakeholders to: • Develop a process to identify potential anchorage locations; • Analyse and respond to environmental, economic, cultural, safety and security concerns now and over the long-term; • Draft a "best practices at anchor" manual; and • Propose oversight/management options for anchorage locations outside the port authority's boundaries. The comprehensive review will use an evidence-based approach, and includes hearing feedback on issues from Indigenous groups, coastal communities, other levels of governments, and industry. Results and lessons learned from the Interim Protocol will help inform the national Anchorages Initiative.	

Stz'uminus First Nation

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-22.3	Related concerns regarding: • Pollution impacts from anchoring ships to shellfish; • Ships not following proper bilge water regulations; • Invasive species of clams being introduced and varnish clams disappearing; and • Invasive species of mussels (blue) being introduced to Penelakut territory.	17-Jun-2014, Technical Working Group Meeting #4	**17-Jun-2014, Meeting:** There are regulations currently in place that prevent the discharge of bilge water in VFPA jurisdiction. Similarly, vessels that enter VFPA jurisdiction are not permitted to release raw sewage effluent. If required, untreated sewage can be discharged at least 12 miles (19.3 km) from shore with the ship moving faster than 4 knots. If sewage is comminuted (i.e., blended or pulverised), discharges can take place 3 miles (4.8 km) from shore. For ships equipped with approved treatment plants there are also limits to the permissible coliform counts	**Addressed in EIS Section 13.6.2.1:** Potential operation-phase changes from wastewater (sewage) and stormwater discharges, and discharges from ships (bilge water and ballast water) are not expected to affect marine vegetation due to the distant location of discharges into subtidal waters, the incorporation of management and treatment measures described in EIS Section 4.2.1, and the implementation of regulatory requirements and guidelines (refer to EIS Section 9.7.8 for more information). **Addressed in EIS Appendix 7.2-B (#100):** The VFPA was the first port in North America to prohibit in-port ballast water exchange without prior mid-ocean exchange, a practice which became the basis of government requirements now enforced by Transport Canada. To prevent the invasion of foreign species into local waters, international regulations, through the IMO, are managed by Transport Canada. All commercial deep sea vessels are required to carry out a ballast water exchange prior to entering Canadian waters. This is done outside the exclusive economic zone of 200 nautical miles and in water deeper than 2,000 m. By requiring vessels to complete this ballast 'flush' well outside Canadian waters, the aim is to prevent any foreign organisms from entering into the local ecosystem. The U.S.A. has similar requirements, and vessels arriving from the Puget Sound area need to forward the completed U.S. forms to Canadian authorities prior to entry into Canadian waters. Import containers are generally not opened at the terminal. Canada Border Services Agency inspects the contents of a percentage of import containers off-terminal in Richmond, and in the future will be done at the facility on Tsawwassen First Nation land currently being developed. All ships use rat guards on their mooring lines to ensure that rats and other rodents do not crawl up or down the mooring lines between the ship and the wharf. The VFPA is a part of the B.C. *Spartina* Working Group, which maps, tests eradication methods, and supports the removal of invasive English cordgrass from the Fraser River estuary.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 9.7 Marine Water Quality 9.7.8 Future Conditions with the Project 13.0 Marine Fish 13.6.2.1 Changes in Water Quality

Table 23: Potential Accidents or Malfunctions

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-23.1	Asked who is responsible for the cost of clean-up in the event of a spill and who is responsible for compensation of lost food sources for First Nations people. Stated that the VFPA should be held accountable, not just the shipper. Asked how the VFPA is bolstering WCMRC capacity to respond. Asked whether the VFPA contributes to WCMRC. Asked if Canada's compensation regime for impacts from a major container vessel casualty from its containers, debris, and/or wreckage fully compensate for natural resource damages, as well as to Cowichan Nation Alliance subsistence (non-commercial) and traditional fisheries. If yes, what are these compensation avenues?	07-Oct-2014, Aboriginal Groups Workshop #1 22-Oct-2014, Cowichan Nation Alliance EIS Workshop #1 13-Jan-2016, Letter to the CEA Agency from Cowichan Tribe on behalf of Cowichan Nation Alliance (CEAR Document #385)	**07-Oct-2014, Workshop:** Explained that with WCMRC, each vessel (i.e. the shipping company), the terminal operator (the company responsible for the loading and unloading of ships), and the company responsible for constructing the project in the first place, must have a formal agreement with WCMRC, and pay into the fund/service, and then WCMRC responds to the spills. **22-Oct-2014, Workshop:** Stated that the framework of responsibility is based on the polluter pays principle. Each vessel, the terminal operator (the company responsible for the loading and unloading of ships), and the company responsible for constructing the project, must have a formal agreement with Western Canada Marine Response Corporation (WCMRC), and pay into the fund/service, and then WCMRC responds to the spills. Stated that the VFPA would be responsible for the safe access and transit to or from the site, and implementing changes to navigation patterns to keep people clear of a potential spill. Increased traffic and risk of collision is considered in the assessment. The review panel will need to consider the VFPA's role in such an incident. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response. **12-May-2016, Letter from the CEA Agency to Cowichan Nation Alliance (CEAR Document #398):** *The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review.*	**Addressed in EIS Appendix 7.2-B (#207):** The EIS describes the parties who would be notified and assume responsibility as On Scene Commander for spill clean-up in the event of a marine spill within VFPA jurisdiction, including Roberts Bank. These parties include the Canadian Coast Guard and the WCMRC. The VFPA's role following a spill would be to maintain situational awareness and coordinate the incident response. **Addressed in EIS Appendix 7.2-B (#208):** Generally, the owner of the vessel from which the spill originates is responsible, in accordance with the *Marine Liability Act*. There is more information on liability on Transport Canada's website, which explains liability and compensation for oil spill clean-up and damages, including funds available for clean-up: http://www.tc.gc.ca/eng/marinesafety/menu-4100.htm#m. Additional sources information on funds available for clean-up are available at the following link: http://www.tc.gc.ca/eng/marinesafety/oep-ers-regime-funds-1119.htm **Additional information provided by the VFPA:** The *Canada Shipping Act (2001)* is Transport Canada's regulatory framework surrounding marine pollution and its enforcement. In the case of a report of pollution in the water, including oil or fuel spills, Canada operates under the National Spill Response Protocol, which specifies that the Canadian Coast Guard is responsible for ensuring the clean-up of ship sourced spills of oil and other pollutants. While the VFPA is not the lead agency when it comes to spill response, it provides assistance often in the form of working with first responders and other agencies, providing information on a situation through the 24/7 operations centre, security cameras, patrol boats, and drone. As per a 2009 letter of understanding, the VFPA can be called upon by the Coast Guard to conduct an initial inspection in response to a pollution report in our federal jurisdiction. On the west coast, the Canadian Coast Guard contracts spill clean-up to WCMRC. This is also the agency that ships or terminal operators are required to call if they discover they have been the source of a spill.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 30.0 Potential Accidents or Malfunctions 30.3.3 Port Metro Vancouver Practices and Procedures Appendix 30-A Marine Vessel Incidence Prediction Inputs to the Quantitative Risk Assessment
STZ-23.2	Concerned that the assessment for accidents and malfunctions should consider extreme weather events, not only ideal/normal weather patterns.	22-Oct-2014, Cowichan Nation Alliance EIS Workshop #1	**22-Oct-2014, Workshop:** Responded that the VFPA is taking a conservative and worst-case scenario approach, so weather extremes are considered. The worst weather condition might also be overlaid with the timing of something such as spawning season, for the purposes of the assessment. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:**	**Addressed in EIS Appendix 7.2-B (#213):** A description of how local conditions and natural hazards, such as severe or extreme weather conditions and weather-related events, could adversely affect the Project, and how these in turn, could affect the environment, is presented in EIS Section 31.0. Project design and management measures capable of mitigating the effects of extreme weather conditions on the Project also will effectively address any potential effects associated with ideal/normal weather patterns. As described in EIS Section 9.1, climate is recognised as one of the primary drivers in shaping the Roberts Bank ecosystem. The influence of weather patterns typical for	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 9.0 Physical Setting 9.1 Climate, Coastal Conditions, and

			Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	south coast B.C. and Roberts Bank are considered as an aspect of the Project's physical setting in existing conditions, expected conditions, and future conditions in the assessment of Project-related effects on the ICs and VCs.	Geotechnical Considerations 31.0 Effects of the Environment on the Project 31.2.1 Extreme Weather and Weather-related Events
STZ-23.3	Requested a list of hazardous materials/dangerous goods that are shipped in containers. Asked if there has been an assessment done on which hazardous materials are currently being handled in the Port.	22-Oct-2014, Cowichan Nation Alliance EIS Workshop #1	**22-Oct-2014, Workshop:** Responded the Port has records and statistics on the contents of containers Noted that more information on the contents of containers would be provided in the EIS. Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in MSA Appendix 5-B (#109):** The potential for an accident involving a spilled container, and hazardous contents of containers, is addressed in MSA Section 10.0. Details on the types of hazardous materials shipped in containers are provided in EIS Appendix 30-A (Table G-3 in Appendix G). Regulations for securing containers, and for the transport of dangerous goods, are set by the IMO http://www.imo.org/en/About/Conventions/ListOfConventions/Pages/International-Convention-for-the-Safety-of-Life-at-Sea-(SOLAS),-1974.aspx. The International Maritime Dangerous Goods Code is the international code that establishes where dangerous goods should be loaded on a ship. Some should be loaded below deck, others should be loaded on deck, some dangerous goods need to be separated by certain distances from other types of goods, and some dangerous goods need to be segregated in different holds from other goods. The implementation of the Code is mandatory under the International Convention for the Safety of Life at Sea (SOLAS) and the International Convention for the Prevention of Pollution from Ships (MARPOL 73/78).	**EIS** Appendix 30-A Marine Vessel Incidence Prediction Inputs to the Quantitative Risk Assessment **MSA** 10.0 Potential Accidents or Malfunctions
STZ-23.4	Asked if shipping of hydrocarbons in containers has been included in the assessment, as hydrocarbons are being increasingly shipped by rail, resulting in incidents. Asked if there is an increase in the movement of coal contemplated in the Project.	22-Oct-2014, Cowichan Nation Alliance EIS Workshop #1	**22-Oct-2014, Workshop:** Responded that there have not been plans or projections for a change in the distribution of contents of containers. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in EIS Appendix 7.2-B (#6):** The proposed Project is a container terminal and does not include any coal-related elements. There are no plans to modify the Project to handle bulk oil or coal.	**EIS** 4.0 Project Description Appendix 7.2-B Aboriginal Groups Interests and Issues Table
STZ-23.5	Concerned about the increased tanker traffic including oil spills, spill response, vessel safety, invasive species and cumulative effects.	01-Nov-2013, Meeting with Cowichan Nation Alliance	**01-Nov-2013, Meeting:** Recorded comment for consideration by the Project team. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests, including concerns around cumulative effects, and provided the VFPA's responses.	**Addressed in EIS Appendix 7.2-B (#204):** Potential spills of deleterious materials (e.g., hydrocarbons) and their environmental effects are discussed in the EIS. Plausible worst-case scenarios involving a marine vessel, motor vehicle, and train accident, each assumed to result in a spill of deleterious materials, are assessed. The regulatory management framework, standard practices, and Project-specific measures to reduce the risk of accidents or malfunctions, including spills, as well as the emergency response and mitigation measures to be implemented in the event of a spill are described. Three worst-case scenarios involving hydrocarbon spills were assessed: a container ship impact incident at the terminal, a tanker truck accident on Roberts Bank Way North, and a yard locomotive derailment on the widened causeway. The assessment determined that a ship impact scenario involving a marine spill of heavy fuel oil at the terminal would result in adverse residual effects to all marine biophysical VCs, as well as marine commercial use, outdoor recreation, and land and water use. While the residual effects on southern resident killer whales, coastal birds, and Current Use were	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 30.0 Potential Accidents or Malfunctions Appendix 30-A Marine Vessel Incidence Prediction Inputs to the Quantitative Risk Assessment

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
				considered significant, due to the extremely low probability of such a scenario, all residual effects were considered unlikely. Since the diesel spill in each of the land-based scenarios would occur away from the marine environment, no potential interactions with marine biophysical VCs were identified. Further, no residual adverse effects were identified with respect to socio-economic VCs, including services and infrastructure and human health. As with any activity, the potential for unplanned incidents during Project construction and operation exists. The VFPA, its tenants, contractors, operators, and intermodal partners are committed to continue to improve port-wide operational practices and procedures to ensure the safety of workers and the public, and protection of the environment. The composition and number of hazardous goods containers handled at Deltaport Terminal in 2012 was reviewed during the development of the Quantitative Risk Assessment (see Table B-4 (Appendix B) of EIS Appendix 30-A). The estimated probability and potential consequences of a range of accidents or malfunctions, including spills of deleterious materials from ships during Project construction and operation, are described in the EIS. **Further information provided by the VFPA:** **07-Jan-2014, Letter from the VFPA:** The proposed Project is being designed to exclusively handle containers. There will be no additional tankers as a result of the Project. The proposed Project will undergo a thorough and independent environmental assessment, which will include a component that will look at potential cumulative effects and potential for spills.	
STZ-23.6	Concerned that bunker fuel or cargo spill would be distributed by ocean currents - not just in shipping lanes.	09-Sep-2015, Letter to the VFPA from Cowichan Tribes on behalf of Cowichan Nation Alliance	**02-Oct-2015, Letter from the VFPA to Cowichan Tribes cc: Stz'uminus First Nation, Halalt First Nation, Penelakut Tribe:** The document shared by the VFPA on July 27, 2015 included a draft summary of Cowichan Nation Alliance's Current Use in the marine shipping study area, and therefore did not include accidents and malfunctions or potential effects. These topics will be addressed in the report to be submitted to the CEA Agency in the fall of 2015. For more information regarding factors considered in the assessment of effects of marine shipping associated with the Project, please see the Marine Shipping Overview document shared with Cowichan Nation Alliance on May 26, 2015, or the *Updated EIS Guidelines*, issued by the CEA Agency on April 17, 2015.	**Addressed in MSA Appendix 5-B (#104):** The assessment of potential accidents or malfunctions (MSA Section 10.0), considers the effects of a plausible worst-case spill scenario on the environment. The plausible worst-case scenario assessed is a powered grounding of a container ship resulting in a release of heavy fuel oil. The location of the plausible worst-case spill scenario is in Boundary Passage near the south end of South Pender Island. MSA Section 10.0 includes a description of the applicable mitigation for a plausible worst-case spill scenario. **Addressed in MSA Section 10.0:** The assessment for the plausible worst-case spill scenario concluded that, with the exception of human health, measurable residual adverse effects are predicted for all VCs. In all cases, the identified residual adverse effects of a spill are unlikely to occur, because of the very low probability of an accident or malfunction that could result in a spill. With the exceptions of residual effects on marine mammals (southern resident killer whale), marine commercial use (guided sport fishing and marine-based tourism sub-components), outdoor recreation, archaeological and heritage resources, and Current Use, adverse residual effects were considered not significant. A serious residual adverse impact on the ability of Indigenous groups to exercise Aboriginal and treaty rights in areas overlapping or near the hypothetical spill area would be expected in the event of such a spill.	**MSA** Appendix 5-B Aboriginal Issues and Interests 10.0 Potential Accidents or Malfunctions 10.3.3 Identification of Plausible Worst-case Accident or Malfunction Scenarios 10.4 Mitigation
STZ-23.7	Concerned with the safety of those participating in Tribal Journeys.	17-Jun-2015, Meeting with Cowichan Nation Alliance	**02-Oct-2015, Letter from the VFPA to Cowichan Tribes cc: Stz'uminus First Nation, Halalt First Nation, Penelakut Tribe:** Stated that potential effects will be addressed in the MSA, which will be submitted to the CEA Agency.	**Addressed in EIS Appendix 7.2-B (#206):** A quantitative risk assessment of potential accidents and malfunctions related to marine vessel traffic, including the risk of a collision between a container ship and small craft (i.e., fishing and recreational vessels), was undertaken and is described in EIS Section 30.0, as well as EIS Appendix 30-A. Data collected by DFO between 2008 and 2012 for vessels in DFO sub-areas encompassing Canadian and U.S. waters transited by ships bound for Roberts Bank was reviewed. These data indicated that daily fishing vessel numbers in the area are	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 30.0 Potential Accident and Malfunctions 30.4.4 Vessel Collision

Stz'uminus First Nation

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-23.10	Asked if there will be planning and collaboration by Transport Canada with the Cowichan Nation Alliance on potential places of refuge within our Traditional Territory Stated that if yes, what are Transport Canada's intentions and approaches?	13-Jan-2016, Letter to the CEA Agency from Cowichan Tribe on behalf of Cowichan Nation Alliance (CEAR Document #385)	**12-May-2016, Letter from the CEA Agency to Cowichan Nation Alliance (CEAR Document #398):** *"The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	**Additional information provided by the VFPA:** Transport Canada's response to information request TC IR-07 discusses planning and collaboration in the development of new places of refuge. In its response, Transport Canada notes it "recently led a review and update of the Pacific regional POR [place of refuge] plan. The plan provides guidance in regional POR planning and decision-making for federal, provincial, First Nations, municipal and non- government partners, and includes a more comprehensive and cooperative mechanism for risk assessment and decision-making. As the federal government retains responsibility for marine shipping, if the urgency of the situation requires immediate action, Transport Canada and Canadian Coast Guard will initiate action under the *Canada Shipping Act, 2001* and engage with other partners (e.g., Province of BC, Public Safety Canada, Parks Canada, Environment and Climate Change Canada, First Nations, municipalities) as soon as possible thereafter using the plan, including the Incident Command System and Unified Command. Under the Oceans Protection Plan, places of refuge engagement will be expanded to the rest of the Pacific coast to enhance the plan with new sub-regional annexes, including for the South Coast, summarising the navigation criteria, in balance with the environmental, socio-economic and cultural values of First Nations and local communities that may be exposed to some risk from a POR decision. These new annexes will modify and/or update current pre-surveyed places of refuge, from the existing regional plan dated 2009. It should be noted that "pre-surveyed" doesn't mean "pre-designated". Actual assignment of a place of refuge anchorage is undertaken in accordance with this plan, using a cooperative risk assessment and decision-making process whenever time and operational imperatives allow. Engagement with other First Nations and coastal communities will ensure these annexes are developed in a balanced and fully informed manner."	**TC IR-07 (CEAR Document #982) from Transport Canada to the Review Panel re: Response to Information Requests issued by the Review Panel on May 10, 2017**
STZ-23.11	Asked if there are regions and periods whereby sea conditions for daylight oil spill and/or container-debris response are not safe or ineffective within our Traditional Territory. If yes, what would be the frequency of limiting factors such as: waves, wind, fog, currents, etc. within the marine study area?	13-Jan-2016, Letter to the CEA Agency from Cowichan Tribe on behalf of Cowichan Nation Alliance (CEAR Document #385)	**12-May-2016, Letter from the CEA Agency to Cowichan Nation Alliance (CEAR Document #398):** *"The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	**Additional information provided by the VFPA:** Transport Canada is the federal lead in regulating marine shipping in Canada, and other federal departments such as the Canadian Coast Guard, ECCC, DFO, and NRC have key roles that enhance marine safety and security, influence marine shipping activities, and help protect the marine environment. Transport Canada's response to the Review Panel's April 4, 2018 Information Requests provides a whole-of-government overview of activities undertaken by the Government of Canada related to spill management.	**Transport Canada Response to the Review Panel's April 4, 2018 Information Requests (CEAR Document #1204)**
STZ-23.12	As a precautionary approach are current and future environmental impact assessments for vessel casualty scenarios and associated means for mitigation to be based on worst-case analysis rather than relying on statistical analysis to render consequences and preparedness lower as "credible" or "plausible" worst-case scenarios? For	13-Jan-2016, Letter to the CEA Agency from Cowichan Tribe on behalf of Cowichan Nation Alliance (CEAR Document #385)	**12-May-2016, Letter from the CEA Agency to Cowichan Nation Alliance (CEAR Document #398):** *"The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	**Additional information provided by the VFPA:** The methods used to assess the potential accidents and malfunctions are consistent with the *EIS Guidelines* issued by the CEA Agency. **Additional information provided by the VFPA:** Transport Canada is the federal lead in regulating marine shipping in Canada, and other federal departments such as the Canadian Coast Guard, ECCC, DFO, and NRC have key roles that enhance marine safety and security, influence marine shipping activities, and help protect the marine environment. Transport Canada's response to the Review Panel's April 4, 2018 Information Requests provides a whole-of-government overview of activities undertaken by the Government of Canada related to spill management.	***Updated EIS Guidelines*** **Transport Canada Response to the Review Panel's April 4, 2018 Information Requests (CEAR Document #1204)**

	risk determination and emergency preparedness purposes, what direction does Transport Canada provide to the shipping industry and for federal impact assessments in defining the nature, scale and scope of major vessel casualty's consequences?				
STZ-23.13	Asked if heavy fuel oils (bunker) used by the project's container vessels - if spilled in BC's marine temperate waters - submerge (over wash) and/or sink anywhere within the marine study area? If yes, then what is the current capability within industry and government with regards to having specialized equipment and trained personnel to realistically track and recover such oil? How is this specialized equipment and operations evaluated by regulatory agencies?	13-Jan-2016, Letter to the CEA Agency from Cowichan Tribe on behalf of Cowichan Nation Alliance (CEAR Document #385)	**12-May-2016, Letter from the CEA Agency to Cowichan Nation Alliance (CEAR Document #398):** *"The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	**Addressed in MSA Section 10.4:** MSA Appendix 10-B provides qualitative evaluations of the physical fate and transport of potential spills. The evaluation focuses on the Boundary Passage region where the probability of an accident or malfunction and associated spill to the marine environment is greater and the environmental consequence likely higher. The identified residual adverse environmental effects are unlikely to occur, because of the very low probability of the accident scenarios. MSA Section 10.4 discusses existing emergency response mechanisms and arrangements with Response Organisations within the spatial extent of marine shipping associated with the Project. MSA Section 10.4.4.1 specifically discusses the capabilities of WCMRC, the Response Organisation within the marine shipping area. WCMRC maintains a team of full-time and part-time employees, and trains on average 150 to 200 marine contractors and fishers in spill response each year. In addition to formal training, WCMRC conducts a program of equipment deployment and desktop exercises over the three-year certification cycle. WCMRC meets the equipment requirements for certified Response Organisations by maintaining the following: • A dedicated fleet of specialised oil spill response vessels, with a combined skimming capacity of 468 tonnes/hour; • More than 35,500 m of boom; • The capacity to clean-up 1,500 m of shoreline/day; • 8,100 tonnes of primary storage capacity; • Four sweep systems for on-water oil collection; • Incident Command Post kits containing all the materials and equipment required to establish and operate a complete Incident Command Post. Three of these kits are currently stored in trailers ready to be mobilised in Burnaby, Duncan, and Prince Rupert, B.C.; • A communications network that includes fixed and portable repeaters and a mobile communications vehicle for supporting remote operations; • Equipment or Office warehouses in Burnaby, Duncan, and Prince Rupert; and • Equipment caches in Haida Gwaii, Kitimat, Shearwater, Port Hardy, Campbell River, Sunshine Coast, Port Alberni, Nanaimo, Deltaport, Fraser River, and Esquimalt.	**MSA** 10.4 Mitigation Measures 10.4.4.1 Western Canada Marine Response Corporation Capabilities Appendix 10-B Marine Fate of Shipping Spill-type Accidents
STZ-23.14	Asked if there will be a requirement to heat recovered heavy bunker fuels in BC's temperate waters in order to facilitate its transfer from recovery vessels to transport barges then to land for disposal? If yes, then what is the current capability in industry and government with regards to having	13-Jan-2016, Letter to the CEA Agency from Cowichan Tribe on behalf of Cowichan Nation Alliance (CEAR Document #385)	**12-May-2016, Letter from the CEA Agency to Cowichan Nation Alliance (CEAR Document #398):** *"The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	**Additional information provided by the VFPA:** Transport Canada is the federal lead in regulating marine shipping in Canada, and other federal departments such as the Canadian Coast Guard, ECCC, DFO, and NRC have key roles that enhance marine safety and security, influence marine shipping activities, and help protect the marine environment. Transport Canada's response to the Review Panel's April 4, 2018 Information Requests provides a whole-of-government overview of activities undertaken by the Government of Canada related to spill management.	**Transport Canada Response to the Review Panel's April 4, 2018 Information Requests (CEAR Document #1204)**

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
	specialized equipment and trained personnel to heat and transfer highly viscous, weathered bunker oil? If present, how is this specialized equipment and operations evaluated by regulatory agencies?				
STZ-23.15	Asked if ambient-temperature water flushing and deluge systems commonly used for sediment-type shore treatment be singularly effective for weathered heavy fuel oil (bunker) stranded on shore? If not effective, will these water-systems require augmenting by heated water or shore-washing agents? For container-debris is there a systematic process to field assess shoreline impacts and then to identify mitigation measures (i.e., clean-up tactics) -such as modelled after the well-established Shoreline Clean-up Assessment Techniques (SCAT) for stranded oil? If yes, where is this guideline and who has been trained?	13-Jan-2016, Letter to the CEA Agency from Cowichan Tribe on behalf of Cowichan Nation Alliance (CEAR Document #385)	**12-May-2016, Letter from the CEA Agency to Cowichan Nation Alliance (CEAR Document #398):** *"The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	**Additional information provided by the VFPA:** Transport Canada is the federal lead in regulating marine shipping in Canada, and other federal departments such as the Canadian Coast Guard, ECCC, DFO, and NRC have key roles that enhance marine safety and security, influence marine shipping activities, and help protect the marine environment. Transport Canada's response to the Review Panel's April 4, 2018 Information Requests provides a whole-of-government overview of activities undertaken by the Government of Canada related to spill management. **Addressed in response to IR11-12:** The VFPA's response to IR11-12, as requested by the Review Panel, will provide information concerning Geographic Response Plans (GRP) mapping for shorelines adjacent to and down-current from potential marine accidents and malfunctions associated with the proposed Project.	**Transport Canada Response to the Review Panel's April 4, 2018 Information Requests (CEAR Document #1204)** **Information Requests** Response to Sufficiency Information Request #12 (IR11-12)
STZ-23.16	As a container-debris generally results in a wide-range of types and amounts of HNS (e.g., hazardous materials/dangerous goods), asked who will provide this specialized services for both on-shore and on-water recovery, and who will manage this mitigation measure.	13-Jan-2016, Letter to the CEA Agency from Cowichan Tribe on behalf of Cowichan Nation Alliance (CEAR Document #385)	**12-May-2016, Letter from the CEA Agency to Cowichan Nation Alliance (CEAR Document #398):** *"The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	**Additional information provided by the VFPA:** Transport Canada is the federal lead in regulating marine shipping in Canada, and other federal departments such as the Canadian Coast Guard, ECCC, DFO, and NRC have key roles that enhance marine safety and security, influence marine shipping activities, and help protect the marine environment. Stz'uminus First Nation

Table 24: Potential or Established Aboriginal and Treaty Rights and Related Interests, including Current Use of Lands and Resources for Traditional Purposes

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-24.1	Concerned that the description of Cowichan Nation Alliance's members' historical village (Tl'uqtinus) and use of the area is inaccurate and not respectful. Stated that Cowichan Nation Alliance will review the information and identify information gaps. Provided a list of recommended revisions to EIS Section 32.0.	11-Dec-2014, Health & Aboriginal Rights Workshop – Cowichan Nation Alliance 15-Jan-2015, Letter from the Cowichan Nation Alliance	**11-Dec-2014, Workshop:** Stated that the information presented is an excerpt from the Kennedy (2014) report. Stated that the information could be made clearer. Requested additional clarification in writing from the Cowichan Nation Alliance. **25-Mar-2015, Letter from the VFPA to the Cowichan Nation Alliance:** Responded to the Cowichan Nation Alliance's requested revisions and demonstrated how they had been considered in the draft.	**Addressed in EIS Appendix 7.2-B (#178):** The VFPA provided draft summaries of past and current use and community information within EIS Section 32.0 for review by each Indigenous group and comments received were incorporated. EIS Section 32.1.1.5 presents Stz'uminus First Nation's community profile information. EIS Section 32.2.4.5 presents information in relation to Tl'uqtinus. **Additional information provided by the VFPA:** On April 24, 2014, the VFPA and Cowichan Nation Alliance, which at that time consisted of Cowichan Tribes, Penelakut Tribes, Halalt First Nation, Stz'uminus First Nation, and Hwlitsum, signed a funding agreement to support a RBT2-specific use study. On July 11, 2014, the VFPA provided Stz'uminus First Nation with a draft of the Community Profile Extract for the opportunity to review and provide comments. On October 16, 2014, the Cowichan Nation Alliance provided the VFPA with a report titled *Port Metro Vancouver: Roberts Bank Terminal 2: Cowichan Nation Alliance Current and Planned Use.* The VFPA met the Cowichan Nation Alliance on December 11, 2014 to provide information regarding the assessment of potential Project effects and cumulative effects on Aboriginal and Treaty Rights and Related Interests and Current Use of Lands and Resources for Traditional Purposes; and to identify any additional information to inform the assessment. The presentation and discussion included content regarding the proposed methodology for this assessment, the VFPA's understanding of existing conditions, based on the information provided by the Cowichan Nation Alliance, and preliminary conclusions of the assessment. On December 9, 2014, the VFPA provided the Stz'uminus First Nation with an advance draft of the existing conditions section for "Potential or Established Aboriginal and Treaty Rights and Related Interests, and including current use of lands and resources for traditional purposes" of the EIS. The VFPA requested that Stz'uminus First Nation confirm the accuracy of the information presented and identify any sensitive information that should be removed from the final EIS. Comments on the draft sections were received from the Cowichan Nation Alliance on January 15, 2015.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes 32.1.1.5 Stz'uminus First Nation 32.2.4.5 Cowichan Nation Alliance (Cowichan Tribes, Halalt First Nation, Penelakut Tribe, Stz'uminus First Nation)

Stz'uminus First Nation

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
				On March 25, 2015, the VFPA provided the Cowichan Nation Alliance with a table outlining all Cowichan Nation Alliance's comments on the draft sections, responses to each comment from the VFPA, and a description of subsequent changes made to the sections in the EIS.	
STZ-24.2	Stated that the VFPA is always stating that the Project will have no impacts and is not interested in mitigating effects.	11-Dec-2014, Health & Aboriginal Rights Workshop - Cowichan Nation Alliance	**11-Dec-2014, Workshop:** Stated that the VFPA is open to hearing suggestions for mitigation measures.	**Addressed in EIS Appendix 7.2-B (#5):** The EIS considers clear, enforceable measures that are technically and economically feasible that would mitigate any adverse effects of the Project, as required by the *EIS Guidelines*. The approach to considering mitigation measures for adverse effects is described in EIS Section 8.0. The proposed approach for mitigation to address Project-related effects to marine biophysical VCs is described in EIS Section 17.0. **Addressed in EIS Appendix 7.2-B (#197):** The VFPA has adopted the use of the following mitigation hierarchy to address Project effects: 1. Avoidance, such as through Project placement and design, and adherence to fisheries-sensitive windows; 2. Reduction, such as through the implementation of standard management practices and Environmental Management Plans; and 3. Offsetting, which involves the creation and enhancement of biophysical habitats that support species of the Roberts Bank ecosystem. Marine sub-components or representative species that undergo decreases in productivity will be offset to the extent feasible using onsite offsetting.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 8.0 Effects Assessment Methods 8.1.6 Mitigation Measures 17.0 Mitigation for Marine Biophysical Valued Components 17.1 Avoiding Potential Effects 17.2 Reducing Potential Effects 17.3.2 Offsetting Framework 17.5 Mitigation Summary for Potential Marine Biophysical Valued Component Productivity Losses
STZ-24.3	Concerned that the timing and funding offered by the VFPA to support a TUS study was inadequate. Stated that the VFPA was not provided with the whole breadth of information related to current use, given the timeline and funding provided.	11-Dec-2014, Health & Aboriginal Rights Workshop - Cowichan Nation Alliance	**11-Dec-2014, Workshop:** Explained that if the Current Use study had not been provided to the VFPA, the authors would have been relying on other sources of information, and there may not have been any content in the Current Use report. Stated that there is a lot of value to what is provided by Indigenous groups. If there are major concerns with the way information is being presented in terms of conclusions or content, the VFPA invites Cowichan Nation Alliance to comment.	**Addressed in EIS Appendix 7.2-B (#175):** The VFPA provided funding to the specified Indigenous groups to support consultation. Additionally, the VFPA provided funding to support completion of traditional use studies to these Indigenous groups and all groups provided a traditional use study. Further information, provided during fall 2014 consultation and in writing, has been incorporated into the EIS. The VFPA will continue to consult with appropriate Indigenous groups and there will be further opportunities to provide information through the CEA Agency process.	**EIS** 7.0 Engagement and Consultation Appendix 7.2-B Aboriginal Groups Interests and Issues Table 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes
STZ-24.4	Concerned that current use assessment precludes an assessment of future use. Stated that commercial harvesting, government regulations and legislations have made participation in commercial fishing challenging.	11-Dec-2014, Health & Aboriginal Rights Workshop – Cowichan Nation Alliance	**11-Dec-2014, Workshop:** Stated that the rights portion (EIS Section 32.0) of the assessment incorporates past use as well as interest in future use.	**Addressed in EIS Appendix 7.2-B (#174):** The methods used to assess the potential effects of the Project on Current Use are consistent with existing federal guidance, including the *EIS Guidelines* issued by the CEA Agency.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including

Stz'uminus First Nation

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
	Stated that Cowichan Nation Alliance plans to be fishing in the Project area in the future. Stated that the Cowichan Nation Alliance will supply information about how they see future use fitting into the assessment.		**01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS Section 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes.	The rationale for the determination of negligible residual effects to Current Use is included in the EIS. Information sources used in EIS Section 32.0 are listed in EIS Section 32.2.3, with Project-specific studies appearing in EIS Section 32.2.3.1. A full list of references cited appears in EIS Section 32.4. **Addressed in response to IR10-26:** The VFPA's response to IR10-26, as requested by the Review Panel, discusses potential effects of the proposed Project on the reasonably foreseeable future Current Use activities that have been identified by Indigenous groups.	Current Use of Lands and Resources for Traditional Purposes 32.2 Current Use of Lands and Resources for Traditional Purposes 32.2.3 Information Sources 32.2.3.1 Project-Specific Studies. 32.3 Potential Adverse Impacts on Aboriginal and Treaty Rights and Related Interests Analysis 32.4 Existing Conditions ***Updated EIS Guidelines*** **Information Requests** Response to Sufficiency Information Request #26 (IR10-26)
STZ-24.5	Concerned that Draft Report of Current Use does not include cumulative effects.	09-Sep-2015, Letter to the VFPA from Cowichan Tribes on behalf of Cowichan Nation Alliance	**02-Oct-2015, Letter from the VFPA to Cowichan Tribes cc: Stz'uminus First Nation, Halalt First Nation, Penelakut Tribe:** *"The document shared by the VFPA on July 27, 2015 included a draft summary of [Cowichan First Nation's] current use in the marine shipping study area, and therefore did not include accidents and malfunctions or potential effects. These topics will be addressed in the Report to be submitted to the [CEA Agency] in the fall of 2015. For more information regarding factors considered in the assessment of effects of marine shipping associated with the Project, please see the Marine Shipping Overview document shared with [Cowichan First Nation] on May 26, 2015, or the updated EIS guidelines, issued by [the CEA Agency] on April 17, 2015."*	**Addressed in MSA Appendix 5-B (#23):** The approach to the cumulative effects assessment is provided in MSA Section 6.0. Each IC and VC assessment section considers cumulative changes and cumulative effects to which the Project contributes. This entails consideration of residual effects of routine marine shipping associated with the Project, if any such effects are predicted, in combination with effects of other projects and activities that have been or will be carried out. MSA Section 9.5 describes how Current Use activities have been affected by other projects and activities that have been carried out. As residual effects to Current Use as a result of marine shipping associated with the Project are not predicted, an assessment of future cumulative effects was not carried out.	**MSA** Appendix 5-B Aboriginal Issues and Interests 6.0 Effects Assessment Approach 6.7 Cumulative Effects Assessment 7.1 through 9.4 (All IC and VC assessments) 9.5 Current Use of Lands and Resources for Traditional Purposes, and Aboriginal and Treaty Rights
STZ-24.6	Concerned that the Draft Report of Current Use does not include effects from malfunctions or accidents.	09-Sep-2015, Letter to the VFPA from Cowichan Tribes on behalf of Cowichan Nation Alliance	**02-Oct-2015, Letter from the VFPA to Cowichan Tribes cc: Stz'uminus First Nation, Halalt First Nation, Penelakut Tribe:** *"The document shared by the VFPA on July 27, 2015 included a draft summary of [Cowichan First Nation's] current use in the marine shipping study area, and therefore did not include accidents and malfunctions or potential effects. These topics will be addressed in the Report to be submitted to the [CEA Agency] in the fall of 2015. For more information regarding factors considered in the assessment of effects of marine shipping associated with the Project, please see the Marine Shipping Overview document shared with [Cowichan First Nation] on May 26, 2015, or the updated EIS guidelines, issued by [the CEA Agency] on April 17, 2015."*	**Addressed in MSA Appendix 5-B (#87):** MSA Section 10.0 includes consideration of a collision scenario between a container ship and a smaller vessel such as a fishing vessel. Potential effects of such an event are assessed for VCs marine commercial use, outdoor recreation, human health, and Current Use. MSA Section 9.5 considers the risk of collision and perceptions of safety. MSA Section 10.0 considers plausible worst-case spill scenarios. **Addressed in MSA Section 10.0:** MSA Section 10.5.13 assesses the potential effects on Current Use and potential impacts on the ability to exercise asserted or established Aboriginal and treaty rights resulting from accidents or malfunctions arising from marine shipping associated with the Project.	**MSA** Appendix 5-B Aboriginal Issues and Interests 9.5 Current Use of Lands and Resources for Traditional Purposes and Aboriginal and Treaty Rights 9.5.4 Existing Conditions 9.5.5.1 Negligible Effects of Vessel Transit on Current Use 9.5.5.2 Potential Effects of Vessel Transit on Current Use 10.0 Potential Accidents or Malfunctions 10.5.9 Human Health 10.5.10 Marine Commercial Use

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
				The assessment for the plausible worst-case spill scenario concluded that, with the exception of human health, measurable residual adverse effects are predicted for all VCs. In all cases, the identified residual adverse effects of a spill are unlikely to occur, because of the very low probability of an accident or malfunction that could result in a spill. With the exceptions of residual effects on marine mammals (southern resident killer whale), marine commercial use (guided sport fishing and marine-based tourism sub-components), outdoor recreation, archaeological and heritage resources, and Current Use, adverse residual effects were considered not significant. A serious residual adverse impact on the ability of Indigenous groups to exercise Aboriginal and treaty rights in areas overlapping or near the hypothetical spill area would be expected in the event of such a spill. The plausible worst-case collision scenario has the potential to result in measurable residual adverse effects on human health, marine commercial use, outdoor recreation, Current Use, and asserted or established Aboriginal and treaty rights. In all cases, the identified residual adverse effects of a collision are unlikely to occur, because of the very low probability of collision. The assessment concluded that residual adverse effects are expected to be not significant for marine commercial use and outdoor recreation, but significant for human health. For Current Use, the residual effect could range from not significant to significant, depending on the capacity of the affected Indigenous group to continue to undertake Current Use. In the event of a collision between a vessel engaged in traditional use activities and a container ship, a minor to serious adverse residual impact on the ability of the affected Indigenous group to exercise Aboriginal and treaty rights associated with those activities would be expected. The identified residual adverse effects of a collision are unlikely to occur, because of the very low probability of collision.	10.5.11 Outdoor Recreation 10.5.13 Current Use of Lands and Resources for Traditional Purposes and Aboriginal and Treaty Rights
STZ-24.7	Concerned that Draft Report of Current Use emphasizes Cowichan activities in the international shipping lanes only.	09-Sep-2015, Letter to the VFPA from Cowichan Tribes on behalf of Cowichan Nation Alliance	**02-Oct-2015, Letter from the VFPA to Cowichan Tribes cc: Stz'uminus First Nation, Halalt First Nation, Penelakut Tribe:** *"Your letter additionally includes an expression of concern related to the VFPA's definition of the [marine shipping area]. The [marine shipping area] is defined to include activities that take place between the 12 nautical mile limit of Canada's territorial sea to the limit of the VFPA's care and control. The [marine shipping area] is defined more broadly than the international shipping lane, and is*	**Addressed in MSA Section 9.5:** The spatial boundaries for the assessment are summarised in MSA Table 9.5-1 and shown in MSA Figure 9.5-1 through MSA Figure 9.5-11. The LAA for each Indigenous group was selected to conservatively define the area within which Project-associated shipping has the potential to affect the Current Use activities of that Indigenous group. The RAA for each Indigenous group was established to provide a regional context for that Indigenous group	**MSA** 9.5 Current Use of Lands and Resources for Traditional Purposes and Aboriginal and Treaty Rights

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
			intended to include areas that could potentially be impacted by marine shipping associated with RBT2. It includes the trans-boundary inland marine waters in this area, as well as numerous islands and islets belonging to either the Gulf Islands or San Juan Islands."	for the assessment of effects from Project-associated shipping.	
STZ-24.8	Stated that the EIS identifies "Outdoor Recreation" and "Labour Market" as "Valued Components", saying "Valued components are the focus of the environmental assessment for the purposes of evaluating Project-related effects". But the EIS classifies "Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of Lands and Resources for Traditional Purposes" as an "Other effects assessment" undertaken "in addition to the assessment of intermediate and valued components". Explain the rationale for this distinction: Why is the Protection of Aboriginal Rights not a Valued Component?	15-Jun-2015, Letter to the CEA Agency from Cowichan Tribes and Stz'uminus First Nation (CEAR Document #242)	**13-Oct-2015, Letters from the CEA Agency to Stz'uminus First Nation (CEAR Document #311):** *"This appears to be an item better addressed to [the VFPA] given that they have determined how to determine and characterize valued components. The Agency did not request additional information for this item since there is already some information provided in the EIS. The Panel will determine whether it requires additional information or clarification with respect to this information to inform its sufficiency review."*	**Addressed in EIS Section 32.1:** Section 32.1 of the EIS explains that the assessment of the current use of lands and resources for traditional purposes (Current Use) is subject to different requirements in the EIS Guidelines than the assessment of potential impacts on the exercise of asserted or determined Aboriginal and treaty rights (pp. 32-1 to 32-2). **Additional information provided by the VFPA:** The identification of a component as a "Valued Component" (VC) is based on the definition of environmental effects in Section 5 of CEAA 2012, not on whether a component is valued. The distinction between the assessment of environmental effects defined under Section 5 of CEAA 2012 versus the assessment of potential impacts to Aboriginal and treaty rights comes down to statutory versus common law requirements, which are reflected in the structure of the EIS Guidelines. Section 5 of CEAA 2012 identifies factors for which environmental effects must be assessed under that statute, including under subsection 5(1)(c), which relates to the effects of a change to the environment on Aboriginal people. If residual effects to these factors are identified, the significance of these residual effects must be determined, and cumulative effects assessed, per Section 19(1) of CEAA 2012. The EIS Guidelines identified how Section 5 environmental effects were to be assessed in sections 10.1, 11.1, 12.1, and 13.1. The requirements for the assessment of Section 5 environmental effects (statutory requirements) do not apply to the assessment of rights. Rather, the requirements for the assessment of potential impacts to the exercise of rights stems from common law requirements relating to the Crown's duty to consult and accommodate. The EIS Guidelines lays out the requirements for the rights assessment in sections 9.2, 10.2, 11.2, 12.2 of the Guidelines, which are different from those relating to Section 5 factors (as above, sections 9.1, 10.1, 11.1, 12.1, 13.1). The determination of significance and assessment of cumulative effects, while required for Section 5 factors per Section 19(1) of CEAA 2012, are not required for rights.	**EIS** 32.1 Component Overview and Regulatory Setting

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
				While Current Use is a Section 5 CEAA 2012 factor (under subsection 5(1)(c)), and was accordingly assessed using the VC methodology to meet the requirements of the EIS Guidelines, the VC methodology was not applied to the rights assessment; however, because the Current Use and rights assessments were embedded within the same EIS chapter, but subject to different assessment methods, the chapter was not referred to as a "VC" assessment, even though a part of the chapter was assessed using the VC methodology, and the results drawn forward for application to the rights assessment.	
STZ-24.9	Stated that the conclusions of the VFPA's experts that the impacts on the marine environment will be either non-existent or immaterial is at odds with the fact that the terminal will displace at least 117 hectares of marine area that was previously a useable fishing/marine resource. Stated that the impact is always determined to be negligible, and presentations do not acknowledge the impact that will occur.	12-Nov-2014, Cowichan Nation Alliance EIS Workshop #2	**12-Nov-2014, Workshop:** Shared preliminary results from the environmental assessment, provided information about the proposed mitigation of Project effects, and sought input from members of the Cowichan Nation Alliance.	**Addressed in EIS Section 8.0:** The methods used to assess the potential effects of the Project, including mitigation measures, residual effects, and cumulative effects, are described in EIS Section 8.0. The environmental assessment for the Project was developed to meet the requirements specified in the *EIS Guidelines* and consistent with existing guidance documents, including the Operational Policy Statement Assessing Cumulative Environmental Effects Under the *Canadian Environmental Assessment Act, 2012* and Determining Whether a Project is Likely to Cause Significant Adverse Environmental Effects, the Cumulative Effects Assessment Practitioners' Guide, and the Guideline for the Selection of Valued Components and Assessment of Potential Effects, among others.	**EIS** 8.0 Effects Assessment Methods 8.1 Environmental Assessment Methods 8.1.6 Mitigation Measures 8.1.7 Characterisation of Residual effects and Context 8.1.8 Determination of Significance of Residual Adverse Effects 8.1.9 Cumulative Effects Assessment

STZ-25.1	Requested to know how much of Roberts Bank is taken up by the Project.	05-Mar-2013, Meeting with Cowichan Nation Alliance	**05-Mar-2013, Meeting:** Committed to following up. **01-Apr-2015, Letter from the VFPA to Stz'uminus First Nation:** Provided a copy of the EIS, which included EIS Appendix 7.2-B that summarised Indigenous issues and interests and provided the VFPA's response.	**Addressed in EIS Appendix 7.2-B (#1):** The engineering design of the Project components, as well as construction phase activities are described in detail in EIS Section 4.0. EIS Section 5.0 provides a summary of alternative design options that were considered, and the rationale for the selected option. The proposed Project consists of three main components: 1. A new three-berth marine container terminal; 2. A widened causeway to accommodate additional road and rail infrastructure; and 3. An expanded tug basin to accommodate a second tug operations contractor. The marine terminal would be located immediately west of the existing Roberts Bank terminals, approximately 5.5 km from the east end of the causeway. The terminal would be rectangular in shape, approximately 1,700 m long and 700 m wide, and would support moorage of three container ships on the south side, container storage in the centre, and rail intermodal yards on the north side. The total usable above-water area of the marine terminal would be 108 ha. The Roberts Bank causeway would be widened to link existing road and rail networks to the marine terminal and to accommodate additional road and rail infrastructure. Widening would range from 0 m to approximately 140 m at the widest point. **Addressed in Project Construction Update:** As requested by the RBT2 Review Panel, the VFPA submitted the Project Construction Update (PCU) on June 12, 2018. The report updates EIS Table 4-1, presenting minor changes to the Project footprint. **Further information provided by the VFPA:** **07-Jan-2014, Letter from the VFPA:** The total marine footprint of the terminal will be approximately 117 ha. The orientation of the proposed terminal has been designed to facilitate the berthing of container ships, and to minimise disturbance to marine physical components (e.g., water and sediment) processes. The environmental assessment will include an analysis of potential effects on water areas.	**EIS** 4.0 Project Description 4.4.1 Construction-phase Activities 4.2.2 Project Component Details, Widened Causeway 4.2.3 Expanded Tug Basin 5.0 Alternative Means of Carrying out the Project Appendix 7.2-B Aboriginal Groups Interests and Issues Table **Project Construction Update (PCU; CEAR Document #1210)**

#	Interest / Concern Raised	Date(s)/Methods Raised	Response	Additional Information	Document and Section providing Additional Information
STZ-26.1	Asked what is being proposed for accommodation. Recalled that accommodation for the Deltaport Third Berth (DP3) Project was extended to Musqueam and Tsawwassen, with other nations receiving participation funding only. Asked about the revenue from the Project. Interested in dicussions around a Mutual Benefits Agreement.	01-Nov-2013, Meeting with Cowichan Nation Alliance 11-Dec-2014, Health & Aboriginal Rights Workshop – Cowichan Nation Alliance 16-Jan-2015, Letter to the VFPA from Cowichan Tribes on behalf of Cowichan Nation Alliance 10-Nov-2015, Meeting with Cowichan Nation Alliance 18-Apr-2017, Chief & Council Meeting - Cowichan Nation Alliance	**01-Nov-2013, Meeting:** Stated that the VFPA will provide the Cowichan Nation Alliance with more information regarding economic opportunities at a later date. **11-Dec-2014, Workshop:** Noted interest in joint venture partnership and revenue sharing. Stated that this will be an ongoing discussion. **10-Nov-2015, Meeting:** Recorded comment for consideration by Project team. **18-Apr-2017, Meeting:** Discussed the development of a mutual benefits agreement with Cowichan Nation Alliance and asked for input on what could be included – business, contracting, employment, etc. **16-Jun-2017, Letter from the VFPA to Stz'uminus First Nation:** "Further to discussions at our meeting on April 18, 2017, the VFPA is interested in initiating discussions with Stz'uminus First Nation regarding potential legacy benefits from the Project, Legacy benefits are intended to benefit Aboriginal groups if the Project proceeds, and would be over and above the economic benefits resulting from the Project. Examples of types of legacy benefits are: restoring fisheries, training, funding cultural initiatives, enhancing environmentally sensitive areas or revitalizing aquaculture. As we discussed with you, it is our intent to develop this concept into a plan that reflect the interests, objectives and priorities of Aboriginal groups involved in the RBT2 Project. We welcome input regarding potential legacy benefits for Aboriginal groups that could be provided as part of the Project. With that in mind, we request a meeting with Stz'uminus First Nation to hear about your community's priorities in relation to this funding. In addition to general legacy benefits, the VFPA is interested in entering into direct discussions with Stz'uminus First Nation regarding a potential mutual benefits agreement ("MBA') for the Project."	**Addressed in EIS Appendix 7.2-B (#112):** Opportunities for training and employment opportunities related to the Project are described in EIS Section 32.3.3. As accommodation for any potential effects to specified Indigenous groups' ability to exercise their Aboriginal rights, the VFPA proposes to assist these Indigenous groups in accessing opportunities resulting from the Project. In addition to making contracting opportunities available to specified Indigenous groups, the VFPA will ensure that construction employment opportunities are also made available. To support these Indigenous groups in preparing for employment opportunities, the VFPA will provide training funding and undertake specific job-related information sharing activities, such as job fairs. Through ongoing engagement, the VFPA will seek input from these Indigenous communities with respect to plans to ensure access to Project-related benefits. The VFPA has consulted and will continue to engage with Indigenous groups regarding opportunities to benefit economically and socially from the Project. **Additional information provided by the VFPA:** Stz'uminus First Nation, Halalt First Nation, and Cowichan Tribes have agreed to negotiate a Mutual Benefits Agreement collectively. Penelakut Tribe is negotiating with the VFPA separately. Discussions include opportunities for skills, training, employment and contracting. Discussions regarding Legacy Benefits are also ongoing.	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table
STZ-26.2	Concerned about skills training and the opportunities available. Interested in the skills and training requirements referenced.	01-Nov-2013, Meeting with Cowichan Nation Alliance 17-Jun-2014, Technical Working Group Meeting #4 03-Jul-2014, Aboriginal Groups Valued Components Workshop #2 11-Dec-2014, Health & Aboriginal Rights	**01-Nov-2013, Meeting:** Referred to the InterVISTAS Study and how there is information on the jobs contained within that report. Stated that all jobs will not be unionised and that the VFPA cannot even say there will be a union at the RBT2 terminal. That is not a VFPA decision. These are early days and we are about 7 to 10 years out from being finished. There is an opportunity to identify jobs and skills needed to build it. Talked about support businesses, direct and indirect jobs such as: trucking, logistics centres, and rail business. There is an	**Addressed in EIS Appendix 7.2-B (#215):** During a five-and-a-half-year construction period, the Project would generate significant employment benefits for B.C. Project construction would generate a total of 12,719 person-years of direct, indirect, and induced employment of B.C. workers, and approximately $1 billion in wages: • 4,150 person-years of direct employment, with wages of $494 million;	**EIS** Appendix 7.2-B Aboriginal Groups Interests and Issues Table 32.0 Potential or Established Aboriginal and Treaty Rights and Related Interests, Including Current Use of
